C. J. STODDARD & CO.,

Lock box 192, Washington, D. C.

IRA A. PAINE'S  
CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell. We can give the sportsmen of America no better proof of the superiority of these balls than that W. & C. Scott & Sons, after examining every ball in the market, have ordered 3,000 to be sent to England. In no instance where it has been exhibited has it failed to take the place of all others.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

PAINE'S PATENT  
Feather-Filled Glass Balls  
and Huber Traps.

MESSRS. WILLIAMS & POWELL HAVE ORDERED 30,000 OF THE FORMER, AND FORTY OF THE LATTER. THEY WILL BE SHIPPED FOR ENGLAND ON SATURDAY NEXT. THIS, WITH THE LATE ORDER FROM W. & C. SCOTT & SONS, EFFECTUALLY ESTABLISHES THE SUPERIORITY OF THE

PAINE FILLED BALLS  
AND THE HUBER TRAPS.

Dec 13 1m

Bogardus' Patent Rough Glass Balls  
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the trade.

His IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$5.

W. & C. SCOTT & SONS have ordered 10,000 balls and 24 traps to be sent to England

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street.

Volume 9.—No. 20.  
(No. 111 Fulton St., N. Y.)

### THE WAY OF THE WORLD.

THERE are beautiful songs that we never sing,  
And names that are never spoken;  
There are treasures guarded with jealous care  
And kept as a sacred token.  
There are faded flowers, and letters dim  
With tears that have rained above them,  
For the fickle words and the faithless hearts  
That taught us how to love them.

There are sighs that come in our joyous hours  
To chasten our dreams of gladness,  
And tears that spring to our aching eyes  
In hours of thoughtless sadness.  
For the blithe birds that sing in spring  
Will fit the waning summer,  
And lips that we kissed in the fondest love  
Will smile on the first new comer.

Over the breast where lilies rest  
In white hands stilled forever,  
The roses of June will nod and blow,  
Unheeding the hearts that sever.  
And lips that quiver in silent grief,  
All words of hope refusing,  
Will lightly turn to fleeting joys  
That perish with the using.

Summer blossoms and winter snows,  
Love and its sweet elysian;  
Hope, like a siren dim and fair,  
Quickening our fainting vision;  
Drooping spirit and failing pulse,  
Where untold memories hover,  
Eyelids touched with the seal of death,  
And the fitful dream is over.

D. M. JORDAN.

For Forest and Stream and Rod and Gun.

### Etchings from the East Coast of Florida.

BY THOMAS SEDGWICK STEELE.

(Concluded.)

IN our last letter, the reader bade us adieu while we were silently drifting northward along the palm fringed shores of Indian River, seeking in the few remaining moments of twilight a suitable camp for the night. That night's experience will ever remain fresh in our memory, for our timely Christian teaching to consider "patience a virtue" was of no avail in dealing with the mosquitoes and other insects which came in clouds to our camp fire. We tried our wire-framed nets which had so successfully repelled the black flies of Maine and the Adirondacks, and we wrapped ourselves in the damp sail of our boat, or lay so close to the fire of our "smudge" as to jeopardize our hair and whiskers—still the sharp pointed proboscis of these insects would discover some available part, which aroused our Yankee invention to a new set of tactics.

The only place of importance at which we stopped on our return north to Titusville, was at Pelican Island, fifteen miles south of St. Sebastian River. Imagine an island containing two acres, literally covered with the large and strange birds from which the Island takes its name. Off the bar at the mouth of the St. John's River can frequently be seen the white variety of this same species. But this was the brown pelican (*pelicanus fuscescens*) a bird the size of a goose, and measuring about five feet from tip to tip. This is one of the most interesting of American birds in its habits and general appearance. It has a yellow head, neck of reddish brown, resembling seal-skin, back and breast of silver gray feathers, webbed feet, while from the lower mandible of its bill, a foot in length, hangs an immense bluish colored bag, six to ten inches in depth, according to age, and capable of holding a gallon of water. This bird is never to be found except around salt water, although the white variety frequents the rivers, while neither kind is to be met with further north than Cape Hatteras. Their flight is heavy, but well sustained, and they will remain many hours on the wing at a great height, at which time the pouch is rolled up out of sight. This membrane is sometimes tanned and made to hold tobacco, gunpowder and shot. Pelicans live to a great age, and have been known to attain three score years and ten.

I repeat, that "the island was literally covered," the beach,

the mangrove trees, the old logs, held all they could conveniently accommodate, pushing and crowding each other for a roosting place. They were provokingly tame, and we could walk within ten feet of them without their being disturbed at our approach, while the surface of the water clear around the island was fairly black with them, plunging and sunning themselves. We sat down on a log and watched their movements, as they drove the scaly prey toward the shore, scooping them with their enormous pouches, spread like so many bag nets, and devouring the fish by thousands. Over our heads they flew, passing and repassing, and we had to give good heed to our ways, or we were liable to tread on their eggs, which, in the rudest of nests, reposed on the ground. Obtaining one or two of the finest specimens (more would have been murder) we repaired to our boat well paid for our morning's excursion. Then we stopped at a turtle's camp, purchased some curiosities which they had collected on the outer reefs, visited some wild orange groves, and, after days of sailing and camping, again landed at Titusville.

The morning we left Titusville was cloudy and warm, the thermometer about 70 degrees in the shade. Into a large covered wagon we loaded our baggage, and, with an addition of six gentlemen to our party, we drove across the country six miles, to Salt Lake. The gait of the mules would have pleased the chief of police of any well regulated city, as it was hardly four miles an hour. We could at any time slip down from our seats, run back in the pine woods, pick blue and white violets, jessamines and lilies, and return to find the team at almost the same place in the road. It was so convenient that we shall always hold the driver in tender remembrance, and we regret exceedingly we didn't ask for his photograph, cart, mules and all. But as "all things have an end," so did our ride; and we were in time placed aboard an old barge anchored in a lagoon which communicated with the lake.

Here we waited patiently for the captain of the steamer, from 9 A. M. to 5 P. M. We had bid good-bye to our guide at Titusville, who, with the sail-boat and the balance of the provisions, returned to New Smyrna, and we thought of our larder many times during those seven weary hours. To divert our attention from thoughts of the "inner man," we devised target shoots, races, and tramps back on the road after the delayed officer, who was at that moment "the dearest one on earth," but all to no purpose, while the heat increased every hour. There were a large number of boxes of Indian River oranges aboard, and unfortunately for the firm in Jacksonville, to whom they were addressed, they riveted at last our attention. How invitingly they looked, as peeping out between the slats they returned our glances. Never before or since has that fruit seemed so bewitching, and we little dreamed it had so much personal magnetism. We gazed on it, drew closer and closer, thought of our early moral training, and reverence for the eighth commandment that had been instilled into our young heart. On a full stomach commandments are good, and never should be broken, but ours were empty, and hunger has but little conscience. We crept down to the boxes, and, strange to relate, found one of the bars could be pushed one side. Quite a number of the oranges were decayed, and of course it would be of advantage to the firm to have these removed, and we took an infinite amount of satisfaction in displacing them.

Accidentally a good one made its appearance, and knowing it would be difficult to return it, drew our hunting-knife across it and divided our sin, as well as the orange; among our companions, never realizing so before the "sweetness of stolen fruit." It tasted well—we tried another, and another, until we had each eaten five, and copying the address of the firm on the outside of the crate, we took oath to mail to the house their value in postal currency. To this day it must be quite a conundrum to that firm that out of all the letters with remittances enclosed—were there any who failed to keep their promise.

To dispose of an orange gracefully, and with that ease which cares little of the criticising eyes of your friends, takes more than one winter in Florida to accomplish. There is more than one way to eat an orange; and it is a curious study to note the different modes of warfare with that perverse article. Some fruits show evidences of good training at the first bite and lie submissive in your hands, and amenable to all the rules of polite society; an item that enhances the beauty and

grace of the eater. A pear or a peach can be consumed gracefully and deliberately—a charming *tete-a-tete* lunch can be held over those high-bred fruits, and the lunchers come out of the contest better and wiser. But an orange resists every effort to become refined and cultivated. It flies in your face, "not to speak," but literally and actually at your first approach. The skin combats you with its oil long before you reach the actual fruit; but if you can overcome that, and not loose your eyesight, then the real engagement begins. Charles Dudley Warner would class the orange among his vegetables for moral discipline. The *habitudes* of this locality have made a profound study of the manner in which to dispose of an orange, and the proficiency they have attained ought to have some influence upon the ignorant stranger. First, you must choose whether you will have the juice drip off your elbows or your ears. It will frequently do both in spite of you. I have seen an old gentleman—an accomplished orange-eater—cut off half the skin, bury himself, as it were, deeper and deeper every minute, and finally reappear, breathless but victorious, only to renew the conflict with another. At the north the orange is a little more susceptible to persuasion. The climate evidently chills its naturally depraved instincts, and, with a little dexterity, a very pretty cushion can be made of the divided peel, and the orange eaten with a degree of respect that is due to its age. The youthful orange, with its "foot on its native heath," is obstreperous and unmanageable.

But we will return to our friends in the barge, whose faces grew brighter after eating of the "forbidden fruit." At five o'clock P. M. the long-looked-for captain made his appearance, and with the working of poles by six stalwart darkies, we were landed at Salt Lake on board the steamer Daylight, which was rightly styled from the number of orifices it had in its dilapidated sides, through which the sun gained admittance. From the lake we passed into Snake Creek, whose windings would have puzzled even its namesake. It was so narrow that the steamer filled the entire stream, the tall canes arising six feet above the upper deck, and brushing the boat on both sides.

Entering the St. John's River over four hundred miles from its mouth, we passed down to Lake Harney, where we were transferred to the steamer Volusia.

The scenery of the upper St. Johns is nothing remarkable. Of course there are our old friends, the graceful palmetto, the mangroves, the live-oaks, and the cypress trees, with the dreamy Spanish moss ever pendant from their branches, while frequently on either hand, for miles, extended the Savannahs, filled with many varieties of water fowl. Occasionally a horseman would make his appearance on the banks, and come aboard animal and all, and now and then we stopped to "wood up." We met a party of hunters with a deer over their shoulders, and the noise of the boat would start the wild turkeys on shore, one of which the captain shot from the wheel-house. At the landings we occasionally caught "brim fish," which had a similar appearance to our roach, and at "Cook's Ferry" we examined some Indian mounds and gathered strange flowers and plants.

After spending three days on the stream, passing through Lakes Munroe and George, interested in every object by the way, I sailed down the river and landed at Palatka, which I had made headquarters for mail.

Thus ended my out-door-life in Florida. The shrill whistle of the steamboat and the dash of its paddles will ere long be as common in this section as elsewhere, but nothing can detract from the enjoyment of my first Etchings from its East Coast.

DEB WADDMANN.—We are always glad to find in our foreign exchanges copies of this excellent paper, which is the official organ of the *Allgemeinen Deutschen Jagdschutz Vereins*. Its editor, Mr. R. Von Schmiedeberg, is well known both in the United States and in Germany. The last number which comes to hand contains an excellent account of our bison, with illustrations. German sporting journalism has characteristics of its own, which always make their reading most interesting. Studies of natural history in *Der Wadmann* are always thorough, and such conclusions as they arrive at are always correct. We are too prone in this country to make facts fit to circumstances. It is a mistake to suppose that America is the only country where game is to be found. In Germany, thanks to the protection of their hunting grounds, a day's sport can be had almost at any time which would as foolish our own votaries of the gun.

## Fish Culture.

**THE EASTON SALMON AGAIN.**—The Easton salmon capture may be the first Pennsylvania specimen of any size ever taken, it being on our side of the river where it was discovered and shot; but it is by no means the first taken in the Delaware River, having ourselves reported two or three some months ago—one of them below the city on the Jersey side. From the fact that all of them were of large size, it is believed that they belonged to the original lot placed in the river near Easton. Our own opinion is now, that while the upper waters of the Delaware are, to all appearances, peculiarly adapted to the salmon, as we have before stated, it will not multiply. What has the **FOREST AND STREAM** to say on the subject? Mr. Reeder, of Easton, Pa., one of the State Fish Commissioners, is gathering facts to show that salmon will increase in the Delaware.—*Germantown Telegraph*, December 5.

[All the accumulated data of nearly ten years of experiment are not yet sufficient to determine absolutely whether the planted and transplanted fish will propagate in sufficient numbers to replenish the streams and keep them stocked.—**FOREST AND STREAM**.]

**MINNESOTA.**—The State will distribute a few hundred thousands of brook trout during the months of February and March. They are to be given gratuitously under conditions which require owners of land through which the brooks flow to sign a contract, to be of record, to let the public fish with hook and line during certain months.

**THE CONSTRUCTION OF FISHWAYS.**—Every State in the Union has, or should have, laws for the protection, preservation and propagation of food-fishes. In no State where these laws have been enacted, commissioners of fisheries appointed, and appropriations made for stocking streams, have they been abandoned, after a fair trial, but encouraging reports come from all quarters.

The first and most important principle necessary to the success of fish culture in any State, is to give the fish freedom to go to their natural spawning grounds, the head waters of streams. Prevented from doing this by impassable dams or other obstructions thrown across streams, they become wasteful, and in time will disappear below as well as above the obstruction. It is as natural for fish to ascend a stream to deposit their spawn, as for birds to seek the tree-top, in which to rear their young. With these facts before us the importance of constructing dams which will permit fish to ascend the streams, is quite apparent.

A fishway is but an artificial imitation of the means by which river fish pass up rapids, in their yearly migrations. The fish in their upward course reach the foot of the rapids; here they rest awhile, and then shoot up a slight distance, and again rest behind some rock, where they gather strength to make another leap, and continue in this manner until the fall is passed.

To construct a fishway, take a long box, fasten one end to the top of the dam, and extend the other end to the centre of the pool below the dam. Supposing the box to be sixteen feet long, four feet wide, and two feet high on the inside of the box, pieces of plank, called riffles, are placed transversely, about three feet apart. Each riffle is about a foot high, and extends about two-thirds of the way across. If the first riffle is fastened to the right side of the box, and at a right angle with the side of the box, the next, three feet above it, will be fastened to the left side, and extend thirty inches across it, and so on alternately until the top is reached. The water entering the top of this box, is diverted from right to left in its course, forming eddies or resting-places for the fish in their upward course. These ways can be constructed of stone as well as timber, being, of course, in the former case more durable. Upon the construction of this aid, more than anything else, depends the success of fish culture in all our States.—*Scientific American*.

## Natural History.

## SOME QUESTIONS IN ICHTHYOLOGY.

**PROF. GILL** has very kindly given us some important as well as interesting information, at our desire, in reply to certain letters sent to us by correspondents, which we append:

**EDITOR FOREST AND STREAM:**

I have found a species of minnow in several streams near our city which is new to me, and have never been able to find any description of them. I have several in my aquarium, and they make the finest variety for that purpose of any fish I have ever succeeded in catching. Besides being very beautiful, they are very hardy. They are nearly round; their backs are brown, extending nearly half way down their sides; then comes a gold bronze stripe the whole length of the body of the fish, followed by a black stripe, while the whole of the under side of the fish is of a beautiful blood red color. Can you give me any information regarding them?

Respectfully,

W. E. S.

SMITHSONIAN INSTITUTION, December, 1877.

**EDITOR FOREST AND STREAM:**

The small fish found in the vicinity of St. Louis, of which you send a colored sketch, cannot be with certainty identified from the figure, as it is deficient in details and not quite correct. It is probably, however, a species of the genus *Chrosomus*, and belongs to the family of cyprinids, i. e., the same family as do the carp, dace, shiners, etc. The genus *Chrosomus* is nearly related to the *Phoxinus*, or true minnow genus of England. It contains some of our most beautiful and high-colored fishes. There are two common Western species, the *Chrosomus erythrogaster* and *Chrosomus pyrrhogaster*. Of both of these species, the males at least, in the breeding season, have the belly crimson or scarlet colored, as is indicated by their specific (*erythrogaster*, meaning red belly; and *pyrrhogaster*, fire belly). The generic color is derived from the Greek *chroia*, color, and *soma*, body. As observed by your correspondent, they are among the most beautiful of fishes for the aquarium,

Yours truly,

THEO. GILL.

**EDITOR FOREST AND STREAM:**

A few days since I took a number of gudgeons of the ordinary size with hook and line. Upon their being prepared, about five hours afterward, one of them appeared to be unusually round. When this fish was opened there was taken from it alive a flat, white worm, about fifteen inches in length, and about a quarter of an inch in width at its widest portion. It was immediately placed in alcohol while yet exhibiting considerable vitality, and I have it in my possession. I have thought the circumstance worthy of being noticed as an unusual freak of nature. Respectfully yours,

JOSEPH PAINE.

Your favor respecting the tape-worm of the gudgeon and of other fishes is at hand. The occurrence of tape-worms and other entozoa in fishes is by no means a remarkable case, for there are probably no fishes which are entirely destitute of entozoa parasites, and many are infested by quite numerous species. Our own fishes have not been much examined for their entozoa guests, but many of the European species have been pretty thoroughly searched for specimens. The result has been that all the common species have been found infested with from about half a dozen to a dozen or more species. These species represent genus of a number of different families, and even orders of entozoa. Thus in the gudgeon of Europe (*Gobio vulgaris*) have been found seven intestinal worms; in the barbel (*Barbus communis*), thirteen species; in the bream (*Abramis brama*), twelve species; in the roach (*Leuciscus erythrophthalmus*), fourteen species, and in other fishes corresponding numbers. Thus you will see that "life within life" is exemplified in a striking manner among the fishes as among higher animals. I should add that the figures given are derived from Diesing's great work on intestinal worms (*Systema Helminthum*), published by the Royal Academy of Sciences in Vienna in 1851, and that they would now be somewhat different, but not so materially as to justify the great time and labor which would be necessary to represent the present state of the subject. Yours truly,

THEO. GILL.

For Forest and Stream and Rod and Gun.

## DRUMMING OF THE RUFFED GROUSE.

In the Indiana Geological and Agricultural Reports, 1869, occurs the following by Dr. Rufus Haymond, in his report of the birds of Franklin county:

"*Bonasa Umbellus*.—Ruffed grouse; Partridge; Pheasant. There are still a few lingering among the brush of our uncultivated hillsides. The curious drumming noise which this bird is in the habit of making during the breeding season in the spring, and upon warm days in the latter part of October and first of November, is familiar to all who live near its haunts, but the manner in which this sound is produced seems to have escaped the observation of nearly every one. Even the great Audubon, whose observations were usually so correct, was mistaken as to the manner of its production. He says 'It beats its sides with its wings in the manner of the domestic cock, but more loudly, and with such rapidity of motion, after a few of the first strokes, as to cause a tremor in the air, not unlike the rumbling of distant thunder.' This is well told and true, with the single exception that the bird does not beat its sides. The drumming is produced thus: The pheasant, standing upon the trunk of a prostrate tree, usually surrounded by brushwood, erects his body to its full height, and produces the drumming sound by striking the convex surfaces of his outstretched wings together behind his back, just as we often see boys swinging their outstretched arms behind them, so as to make the backs of their hands meet behind and opposite their spine. This is the truth of the matter. Audubon's idea that the pheasant could produce a louder noise than the domestic cock, nearly four times his size, by beating its small, compact body with its wings, is, to say the least, a curious mistake. The hollow, rumbling sound could not be produced in this manner."

What Dr. Haymond says in the above report, save that now and then some one logs the hollow log forward, is the only account I have met with about our choice little friend and his drumming. It is passing strange that Audubon, who must have known almost the exact habits of the pinnated grouse, did not learn that its cousin, the ruffed grouse, makes use of almost identical means to produce almost the same sound—at least, the tone is the same. If you will call to mind the hollow boom of the bittern—known more commonly through the West as the Thunder Pumper, and sometimes as Pump Suck and Stake Driver—you will notice that it produces almost the same hollow sound, and to locate, and seeming at a distance, though the bird may be close at hand. So again with the cooling of our domestic pigeon, and the beautiful dove in the woods; all these birds have air cells on or about their necks, that answer for sounding boards or sacs. All of them, before giving forth the first note, inflate their pouches, but have different ways of giving it forth.

Let us first account for the drumming of the pheasant. Those that I have seen, and I assure you they were not a few, did not need any hollow log: Where or whenever a cock pheasant, during the warm days of early spring, came across one or more hens, he could do enough drumming, but always preferred to mount some sort of a place where he could see and be seen. He would then work himself into an excited state by walking about, head and tail at right angles with his back, and his ruff extended, much like a dung-hill fowl when going to battle; he would then raise his head up and down several times, when, if you were near, you could see his pouch of a reddish orange color, clear around his neck under his ruff, and distended with air. Suddenly, he would strike his compact little body just as Audubon saw him do, but with his wings only half open. As he would strike, he would give forth a nasal sound, which I have described in a former article on pinnated grouse. The blows then follow in quick succession, till the air is exhausted or driven out of his pouch. He would then go and talk with the hens a bit before another drumming fit would come on. It would seem that a pheasant would want good toe nails and good, firm bark on his log to hold him, to strike straight out, or beat the air with his wings rapidly enough to produce that noise, when we reflect that the noise he makes when he is flushed can only be heard a short distance.

It is very difficult to get near enough to a cock pheasant to observe his motions, and not flush him. I have made twenty attempts before accomplishing what I desired. Still I could have shot nearly all of them if I had desired. If any sportsman should wish to see the pouch of the ruffed or pinnated grouse, obtain one during the breeding season and hold the neck close down to the body, so that no air can pass; then put a grain of corn or small stone in the bird's mouth, and put his bill in your mouth and blow down the bird's throat. The skin of the pouch adheres at other times so closely to the bird's neck, that it is hard to discover; but during the breeding season, the neck, like that of the red deer, becomes very much enlarged. Now that's enough for this time. White Co., Ind.

[Although the question of how the ruffed grouse drums has been discussed at considerable length in these columns in times past, Monon, as far as we know, stands alone with his explanation of this curious phenomenon. Certainly, what we know of the love calls of the Sage, Sharp-tailed, Pinnated

BALTIMORE, NOV. 2, 1877.

and Dusky grouse, lends no small degree of probability to this novel theory. Every sportsman must have observed the naked spaces on the neck of the ruffed grouse, and we have often speculated on the possibility of their being inflatable, but have never had the opportunity for experimenting with them. It seems odd, though, that none of our ornithologists have ever noticed any habit of this kind.—Ed.]

## THE WHITE BUCK OF CAPE COD.

WAREHAM, MASS., NOV. 24, 1877.

**EDITOR FOREST AND STREAM:**

I indulge in the assumption that all the numerous readers of **FOREST AND STREAM** have seen the white negro, the white crow, the white rabbit, and, laughable contradiction of words, the white blackbird; and that they have read of Capt. Ahab's Moby Dick, or the monster white whale, all of which are understood to be albinos, and now I propose to give you a brief pen sketch of the white deer of Cape Cod, and he too, I claim, is an albino. He is a noble buck of the forest, but has so far failed to propagate his species and show to the world the slightest trace of his noble blood in the Jacobian lineage of ring, striped and speckled. I have reason to believe that outside of a limited local circle very little is known of the great number of deer in the forest of Cape Cod, comprising a portion of six towns, the Marshalse Reserve in the counties of Plymouth and Barnstable. These forests range from the Vineyard Sound, so to speak, in the town of Falmouth, skirting along Buzzard's Bay northerly some thirty miles, and from the same point easterly twenty-five miles; in width varying from five to fifteen miles, dotted with an occasional rich and well painted hamlet, well tilled farms, and last, though not least, the forester's cabin home, an institution not unknown to the knights of the rod and gun. To-day it is reported by experts of unimpaired reputation and knowledge that there are more than five hundred deer gamboling in these forests, and that their grand career, or lurking grounds, are in the towns of Sandwich, Falmouth and Marshalse Reserve in the county of Barnstable. This fact is unquestionably owing to the deer having been driven from Plymouth county by the great fire which burned over some fifteen thousand acres of forest lands in 1874. Last season, a known fact, over one hundred of these our forest riddles fell before the huntsman, but now, thank fate, our Legislature this year enacted a law forbidding the killing of deer in this State until 1881 under a penalty of \$109 for each offence, and thus any individual having in his possession a saddle of venison must, if required, prove it was not killed in the State, or suffer the penalty of the law.

Now for the famous white deer of Cape Cod. This marvel was first seen in 1871 and thus he has run the gauntlet and evaded the barbarous huntsman for some seven years, and, strange to relate, has been shot at but twice during these years, and it remains a tale yet to be told that he received a shot from either of the veteran huntsmen who aimed the would-be fatal weapon. The grazing and ranging grounds of this white prince of the forest is comparatively small, and it is believed by the good people of North Falmouth that his nightly lodge during his existence has not been over three-fourths of a mile from the village. He has been seen hundreds of times, and all relate the same story. In size he is unquestionably enormous for his race, and to use the language of an individual who saw him last week lying down in a field in company with three red, or brown deer, "in proportions, judging from his footprints in the sand, he will compare favorably with a decent-sized cow." When he rose to his feet and while stretching he faced our informant, who says his ponderous horns reminded him of a "large rustic rocking-chair." As this, the prince of our forest, is not a humbug I hope some student of natural history, a farmer, for instance, will feel induced, with some Yankee hurdle device, to capture this deer alive and place him in some one of our American city public parks, and show to the world the renowned albino deer from Cape Cod.

CYRUS LISCUM.

## THE MIGRATORY QUAIL.

RUTLAND, DEC. 12, 1877.

**EDITOR FOREST AND STREAM AND ROD AND GUN:**

The lines chosen by your correspondent in no respect resemble the migratory quail. In color they resemble the ruffed grouse or partridge of N. E. The head of the female is quite similar to our partridges, and the male is darker about the head than the female, with quite dark marking under the neck. There are no white feathers about the bird. The legs are shorter than the American quails, but also dark like the partridge. My faith in the return of the birds here is unshaken, and that in twenty years they will be the most numerous game here in America. The only question is, will they find a suitable wintering place in the South? Yours truly,

M. G. EVERTS.

## SHELLS IN RED HEAD DUCK'S CRAW.

**EDITOR FOREST AND STREAM:**

Being engaged in preparing for the press a paper on the Mollusca of the Bermudas, I should feel greatly obliged to W. J. R. Sutton, whose identification of *Littoria bombix* occurring on gulf weed, appears in your last issue, if he would kindly forward me for inspection a few specimens of the shell, as I have only found *L. atlantica*, Rang, an inhabitant of the weed which floats to the Atlantic shore. If he desires I shall be happy to supply him with specimens of the latter species for his cabinet.

Haiti, N. S., Nov. 20.

J. MATTHEW JONES.

The above communication having been handed to Mr. Sutton, we have received from him the following note:

**EDITOR OF FOREST AND STREAM:**

Referring to the letter from Mr. J. M. Jones, handed to me to-day, I have to say the shells sent me from craw of red-head duck were considerably decomposed and somewhat difficult to identify. Capt. J. H. Mortimer, of the ship Hamilton Fish, to whom I showed them, is quite certain the shells sent and *Littoria bombix* were identical. Capt. M. does not know the *L. atlantica* that Mr. Jones speaks of, but the *L. bombix* he is familiar with, having picked them up on the gulf weed while on one of his many voyages. I take pleasure through the kindness of Capt. M. in sending Mr. Jones to-day a few specimens of the *L. bombix* also some of the gulf weed with the web spun by *L. bombix* attached and have accepted of his kind offer of *L. atlantica*. Respectfully yours,

New York, Nov. 26, 1877.

JAS. R. SUTTON.

## AN AGGRESSIVE BUCK.

**EDITOR FOREST AND STREAM:**

BOSTON, DEC. 14, 1877.

The old buck on our Boston common has killed no less than six deer in the same enclosure with himself, ending last night with the old doe. Ought he not be separated most of the year from the rest, or would it be feasible to saw off his antlers? Please let me have reply as to what is the usual custom in regard to management. He is eight years old, well formed and father of a number of healthy deer. No cause for dislike or enmity appeared in the victims. The autopsy of the old doe to-day gave numerous bruises and patches of effused blood in peritoneal

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, continuity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### FOX HUNTING.

EDITOR FOREST AND STREAM:

It would seem from what I read in the New York papers, and from my correspondence, that a subscription pack for hunting the fox has, after many an effort on the part of a few game young Gothamites, at last become *au fait accompli*—an accomplished fact, as the French would say—and am rejoiced that my predictions of possible failure, expressed in your columns some time since, have proved groundless.

I feared that your traveled young Anglo-maniacs, dazzled by the really magnificent hunting equipages of Leicester, would aim too high, and overshoot the mark by attempting the introduction of the fashionable high strung hounds of the most famous hunting shires of England, but a friend, a "top-sawyer" and "first flight" man of your Queen's County hunt, Mr. A. P. B., writes me as follows: "So far we have been successful, and I think we have established the pack so that it will last. I don't altogether agree with you about the American hounds answering our purpose better than an English pack, for the following reasons: The American hounds that I have seen or heard of are all taught to race among themselves, whereas an English pack is taught to keep together, or pack, and can be more easily controlled by the huntsman. Our hounds are more harriers than foxhounds, being only about eighteen inches at the shoulder.

My friend's criticism of American hounds is in the main just, the racing among themselves of American hounds naturally follows from the manner in which most American packs are constituted. In Maryland, Virginia and Mississippi, the States to which my hunting experiences are confined, generally—not always—the hounds composing a pack belong to different parties living in the same neighborhood within horn blow of each other, and each man comes to the meet followed by his own dogs. As may be supposed, the rivalry between these parties to own the fastest dog is very great, and thus the most desirable qualities in a hound are sacrificed to mere speed; but where the whole pack has but one master, as is the case with those of T. G. T., of Gaston; Pious Jeems, Gen. Starke, Broadnax, and others that I might mention, a dog may be rejected for too much speed, as he would be for the lack of it.

Forty years ago, when I hunted my own pack in the Maryland settlement, near Church Hill, in Mississippi, I gave away several hounds for being incorrigibly fast. I use the word incorrigibly, because I vainly made every effort to correct the defect by putting drags upon them in the shape of a trailing rope fastened to a collar, and in one instance by a ligature on the hind leg, just above the hock. These dogs, though excellent in their way, destroyed the harmony both of the action and music of my pack.

But in Mississippi speed was not so great a desideratum, for we hunted the gray fox, a varmint which for all the game qualities will compare with the red fox, as would a "hob-tailed yellow cur," with George Coburn's "Dash," or Bryson's "Gladstone." But in my judgment the gray, with his short doubles, affords more sport than the indomitable and untiring red, and I hold it to have been a great mistake to have imported the latter from beyond the seas.

After thirty years' experience in riding to hounds after both red and gray foxes, I must say that the most perfect sport I ever enjoyed was when after a gray fox with those Mississippi hounds, which ran so closely packed that they might use a hunting phrase—have been covered with a blanket. I have had capital sport, too, with red foxes. I have ridden forth at the first glimmering of the dawn, and witnessed with a delight which no other field sport can give, the trailing of an old red through all the intricacies of his midnight wanderings, until a grand burst of thunderous music from the eager pack would announce that he was off. Mounted on a gallant horse, I have followed the swiftly flying pack in a delicious delirium of excitement, such as I fancy a Hampton, a Fliz Lee, a Jackson, or a Custer might have felt, as with lifted sabre he led a victorious cavalry charge. I have enjoyed the triumph of being first in at the death, and winning the white-tipped brush, that trophy so prized by every true sportsman; but then would come the reaction. Weary and hungry, I would find myself twenty miles from home, on a horse so tired he could scarcely keep his legs.

The gray fox, rarely runs outside of a circle of five or six miles, taking his starting-point, and the limit of his endurance is rarely over two hours, hence there is no such reaction after the excitement of hunting him, and I for one deplore the gradual extinction of our native fox, and would, if I could, restore him to the dominion which is being slowly but surely usurped by the red foreigner. In an early volume of the old "Turf Register and Sporting Magazine" may be found the precise date at which the first red foxes were imported from England to America. They were turned loose on the eastern shore of that State by a famous sporting squire, whose name I do not remember. They were confined to the eastern shore for several years, until during an unusually hard winter the Bay was frozen down to the capes, when the reds crossed over to the western shore, where they have almost superseded the native grays. Red foxes were also imported into Virginia, and the date of their introduction on Long Island is a matter of record. While attending the field trials at Bellemead, near Nashville, I heard an enthusiastic fox hunter regretting that they had at a comparatively recent date been also brought to that neighborhood, and that they were rapidly driving out the grays. And this is the case wherever the red fox gets a foot-

hold—the native reynard is driven away or destroyed as the native red man is by his white brother.

You have recently received at your office a great curiosity, a *Lusius nativus*, in the shape of a fox pad, which I hope you will hang up among your most valued trophies. A recent letter from that fine old Southern gentleman all of the olden time, T. G. S., of Gaston, who sent you the pad, alludes to it as follows: "I send you the right hind foot of an old red fox which Broadnax and myself caught this morning, after one of the most vigorous and electrifying runs ever witnessed in an hour and a half. I will in a few days write you a full description of the chases we had after him this week. This fox has been in this vicinity since 1862, and has afforded us sport from that date to the present, and has been the instrument of our testing the qualities of all brag hounds that competed with my pack and Broadnax's. We rarely ran him but on such trials. His track was well known to every person in this neighborhood who ever notice tracks. The right hind foot was much smaller than the other, strikingly so. I send it to you. It is really a curiosity in mark, and is the first white foot I have ever seen on a red fox. Both hind feet were of the same color."

Let me conclude my rambling letter with congratulations on the accession to your columns of so charming a writer on hunting as T. G. T., of Gaston, for some of the admirers of the FOREST AND STREAM complained to me when I was in Nashville that you did not give sufficient space to that noblest branch of field sports—fox hunting. F. G. S.

### POINTS IN JUDGING DOGS.

WE have been requested to reproduce the points in use by judges on bench shows of dogs. As canine exhibitions are getting more and more in vogue, very possibly the publication of these points will be useful to many of our readers.

For these points we are indebted to the *London Fancier's Gazette*, to Stonehenge, Idstone and other leading authorities. We trust to be able to complete the whole series in two publications. We may remark that there are in use for special dogs subdivisions in points, as for instance in judging of a mastiff, the head is divided into—size, 10; shape, 10; eyes, 5; ears, 5; muzzle, 5, or thirty-five points in all. In some cases the whole head is lumped at thirty-five, the judges discriminating between the various fine distinctions. Should any modifications occur in these points—for we are led to believe that some changes are possible—our readers will be sure of having the earliest information imparted to them:

| Shoulders.....                  | 15 | Hind-quarters.....            | 10 |
| Legs.....                       | 10 | Stern.....                    | 5  |
| Feet.....                       | 5  |                               |    |

erately. Heart on right side engorged with venous blood; so lungs. No bones fractured, skin not penetrated. Exhaustion of heart direct cause of death.

SAVONNES.

[The best thing to be done would be to remove the buck. Perhaps it would be wise to get rid of him entirely. When bucks grow old, they frequently become aggressive, and they require watching to prevent their doing serious mischief. The great reason for the trouble was that the range the deer had was too restricted. Deer seem to form family parties, and do not brook intrusion from others of their kind.—Ed.]

NOTES.—The red-headed woodpecker, *Melanerpes erythrocephalus* has been found in unusual numbers in Connecticut this fall. A good many have been seen about New Haven, and three specimens, all young birds, have been taken at Portland. The terrible easterly gale which caused so much damage along our coast about Nov. 25 brought a rare bird to our shores. A specimen of the little auk, or dovkie (*Megulus alle*), was secured in New Haven harbor the day after the storm by Mr. A. H. Thompson, of South Haven. It was very much emaciated, and was apparently unable to fly, since its captor was able to approach it in a canoe, and, striking it with an oar, secured it. Its stomach was quite empty, and it was evidently a lost bird. Mr. Thompson presented it to the Peabody Museum of Yale College.

HORNED DOE ANTELOPES.—*Ferrisburgh, Vt., Nov. 26.*—In one of your late issues I noticed an inquiry regarding horned antelope does with editorial comments thereon. Remembering an incident once happening me in California, I send it:

Riding in the San Joaquin Valley in the early spring of 1871, I suddenly started a horned doe from the nearly dry bed of an arroyo. Upon recovering from her first fright, she charged to within ten feet of my horse, and then began running around me in short circles, stopping now and then to stamp, toss her head, etc., showing in every movement that her young one was hidden near by. I was in a hurry, and could not stop to look it up, so, after watching it a few minutes, I rode on. She was large, as are all horned females, and in fair order. Of course, she may not have had young, I cannot be positive of that; but I never knew a deer to act in this way unless it had a fawn secreted near. Did you?

VERM MONT.

[Never; but more decisive evidence would be necessary to shake our belief that horned doe antelopes are barren.—Ed.]

AN ALBINO QUAIL.—*The Bucks County Gazette* records the shooting of a pure white quail a few days ago at Newton, N. J., by Lewis M. Morford: "The bird is of full size and of full plumage, which is as white as the driven snow. There was another bird equally white in the same bevy, but it escaped. The only mounted specimen of an albino quail in this vicinity, except the above, is the one which ornaments the office of Chief Justice Beasley at Trenton."

A NEW FISH.—*The Cape Ann Advertiser* records the discovery of a fish hitherto unknown to science:

The schooner Wachusett, recently arrived from the Banks, brought in a curious fish, a little over four feet long and having a round tapering body and large head, of a species unknown to our fishermen, but having somewhat of the appearance of a shark. It was caught on a trawl and preserved as a curiosity. On arriving at port, the fish attracted the attention of Capt. Robert H. Hurlbut, who acted as pilot on board the steamer Speedwell, employed in fishery investigations in our waters last summer, and he at once secured the prize and forwarded it to Prof. Spencer F. Baird, of the Smithsonian Institute at Washington. In acknowledging the courtesy of Capt. Hurlbut, Prof. Baird points out how our fishermen can render invaluable aid to the government in its fishery investigations, and urges that all curious fish and marine specimens be carefully preserved and forwarded to Washington. We hope that this matter will receive attention, and that our fishermen will spare no effort to advance scientific inquiry in this direction. We quote from Prof. Baird's letter to Capt. Hurlbut, as follows:

"If you could have the word passed to parties going to Georges and elsewhere fishing during the winter to bring back to them everything curious, we should doubtless get some prizes. Ask them to wrap the fishes up in paper or rag, and put them on ice so as to keep them safely. In shipping, please mix ice about the size of your fist, or less, with sawdust, which will keep unmelted for several days. It is very desirable, too, that the fish be wrapped in something to prevent its rubbing against the ice, or being lashed about when the ice melts. Everything in the way of corals, sea plants, etc., such as they haul up on the Banks, will be acceptable. Do you know, or does anybody in Gloucester know where the hagfish breed? Notwithstanding the myriads on the Banks, I have never been able to find out where they nest. Would it be possible to get the fishermen to bring in some hagfish so that you can send them to me this winter? Abundant as they are at sea, little is known of them in museums. There are three or four kinds, all of which are desirable.

"The fish has just arrived. It is a wonderful prize, a Greenland fish never before seen south of Labrador. It is known as the chimera, and is a kind of cross between a shark and a sturgeon. Get more if you can. We shall make a plaster cast and photograph.

"Nov. 30.—Since writing you about the curious fish, or chimera, I have ascertained that it is still more interesting than I supposed, in being an entirely new species, not before described. I hope, therefore, you will continue your efforts in our behalf, so as to get some more specimens of rare, if not of new species. A number of additional specimens of this same animal would be desirable. It was a female, and the males are very different in shape and appearance."

WANTED, A BULL MOOSE.—A gentleman has a female moose, and is very desirous of propagating the breed. There must be among our numerous correspondents and friends in the North some one having a bull moose. With the possessor of such an animal we should be glad to enter into correspondence.

## OTTERHOUND.

## THE CHARLESTON (S. C.) BENCH SHOW.

CHARLESTON, Dec. 16, 1877.

## EDITOR FOREST AND STREAM:

Our poultry and dog exhibition closed yesterday, and below I give you a list of the dogs exhibited and those to whom prizes were awarded. The exhibition of dogs was not as large as we had hoped, but the collection was remarkably fine, especially of setters and deerhounds. The imported Gordon setter, Brown, entered and owned by our Governor, is a remarkably handsome dog and well deserved the prize. The deerhound, Jeff Davis, entered by Maj. J. C. Minott, is a superb specimen of a hound, and the finest I have ever seen. He is one of the fastest dogs in lower Carolina, and is the same dog that won the "prize collar" for pulling down the stag at the stag-chase we had here a short time since. The bitch Belle, entered by Maj. A. B. Rhett, is a perfect beauty, and is also a very fast thing.

**POINTERS AND SETTERS**—Judges—Col T Taylor, J P Losene, E Wells, W G Hinson, Dr J L Auerum. The entries were as follows: Setter dog, F G S Lucas, Charleston; W C Fisher, Columbia; A M Hume, Charleston; W F Brittain, Athens, Ga; W F Brittain, Athens, Ga; Governor Hampton, Columbia; M Haig, Charleston; E H Sparkman and G A Douglass, Charleston. **Setter Bitches**—T S Inglesby, Summerville; J O Minott, Summerville; (imp) L W Biscate, Charleston; (Gordon) D W Amory, Charleston. **Retriever Dogs**—J H Holmes, Charleston; J B Johnson, Charleston. **Pointer Dogs**—T L Bissell, Charleston; Mr Gunby, Charleston; (Eng) Mrs Fleming, Charleston; (imp pup) H B Horibek, Charleston; (imp pup) J P Grace, Charleston; (Eng) M Haig, Charleston. **Pointer Bitches**—R Bylston, Charleston; Geo E Gibbs, Charleston; J C H Classen, Charleston; (imp) W M Jones, Charleston; (Eng) W Robb, Charleston. **HOUND DOGS**—Judges—Prof F S Holmes, Col J A Yates, J Henry Hapgood, Maj J Minott and Robert Ellison, of Winboro. The entries were as follows: Bloodhound and mastiff, E L Roche, Charleston; deerhound bitch, John C Minott, Summerville; deerhound dog, John C Minott, Summerville; pair foxhounds, Col T Taylor, Columbia; greyhound, C A Hill, Charleston; deerhound, B McGinnis, Charleston; three foxhounds, A B Rhett, Charleston; deerhound, John C Minott, Summerville. **OTHER DOGS**—Judges—Col J B Sloan, Maj A Vanderhorst, Maj T B Hayne, W B Mure, G W Wragg. The entries were as follows: Russian boar hound, Andrew Moffett, Charleston; Russian boar pup, Andrew Moffett, Charleston; Irish stag pup, M M Jones, Charleston; Skye terrier—Wm Gregg, Jr, Charleston; B E Baker, Charleston; W F Brittain, Athens, Ga; Scotch terrier, Mrs D F Fleming, Charleston; bulldog, J McGinnis, Charleston; bull bitch, M C O'Neill, Charleston; bull bitch, P McGinnis, Charleston; pair coach dogs, Dr W M Fitch, Charleston; pair coach pups, Dr W M Fitch, Charleston; Newfoundland Dogs—J H Horton, Charleston; L D de Saussure, Charleston; John E. Cay, Charleston; Newfoundland pup, J H Horton, Charleston; retriever, John H Holmes, Charleston; spitz dog, George L Holmes, Charleston; pair black and tans, W S DeHay, Charleston; bull and mastiff bitch, W S DeHay, Charleston. **POINTS**—Imported dog, Frank, Dr H B Horibek, diploma; imported bitch, no name, R Bylston, diploma. **SEVERAL**—Imported Gordon setter dog, Brown, Governor Wade Hampton, diploma; native setter bitch, Bit, T S Inglesby, diploma. **HOUND DOGS**—Russian boar hound, Rex, Mr A Moffett, diploma; American deerhound, Jeff Davis, Mr J C Minott, diploma; American deerhound, Fashion, Maj J C Minott, diploma; imported foxhound, Sportman, Col T Taylor, diploma; imported foxhound, Belle, Maj A B Rhett, diploma; imported greyhound, Foyle, Mr C A Hill, diploma. **OTHER DOGS**—Skye terrier dog, Trip, Master B E Baker, diploma; Scotch terrier dog, Snider, Mrs D F Fleming, diploma; bull terrier dog, Nero, James McGinnis, diploma; bull terrier bitch, Shot, P McGinnis, diploma; coach dog—Dr W M Fitch, diploma; coach bitch, Dr W M Fitch, diploma; Newfoundland dog—J E Taylor, diploma; spitz dog, Mr Walter, diploma; black and tan terrier bitch—W S DeHay, diploma; mastiff dog, Hampton, E L Roche, diploma; mastiff bitch, Frohlock, Edward Roach, diploma.

**ST. LOUIS DOG SHOW.**—The gentlemen in charge of this great canine event are working with a will. Enthusiastic themselves, they have apparently endowed others with the same feeling. The prizes of a special character are coming in rapidly. Among them we may mention a Greener gun, presented by the Simmons Hardware Company, and F. O. de Luze, agent for Spratt's patent, London, gives a handsome silver cup valued at \$25 gold, for the best native English setter dog, open class. The appointment of Mr. Lincoln as superintendent is an excellent choice. It would be an admirable thing if the breeders—those owning leading dogs—would gather at St. Louis, and pit champion against champion. Here would be the chance to determine who owned the champion dog of America. We might suggest to Messrs. Raymond, Burges, Smith, Foster, Morford, Nesbitt; to Messrs. Stoddard, Jarvis, and owners of various and special breeds to exhibit their cracks. Mr. John Davison will be present at St. Louis and act as one of the judges. We hear of quite a number of toy and fancy dogs to be sent from New York and Philadelphia to St. Louis. Just as soon as possible we will give full information as to the proposed reduction of rates on the railroad. We are only too glad to give this St. Louis exhibition, knowing the high standing of the gentlemen who are to manage it, our fullest support. We are quite satisfied that, as far as the officers have to do with this bench show, it will be loyally and honorably conducted.

## THE MASSACHUSETTS KENNEL CLUB.

BOSTON, Dec. 17, 1877.

## EDITOR FOREST AND STREAM:

The Massachusetts Kennel Club was organized Dec. 6, 1877, and the following gentlemen elected to office: Walter Cowing, President; Ellerton Door, Vice-President; John Fottler, Jr., Vice-President; Timothy T. Sawyer, Treasurer, and Dr. Edw. Foster, Secretary. We are indebted to James F. Curtis, Edw. E. Hardy, Dr. Wilson Borland, Saml. Rodman, Saml. Hammond, Dr. Francis B. Greenough, Luther Adams, Chas. E. Fuller and several prominent New Bedford sportsmen, together with the officers, for the interest they have displayed in organizing this club. The first meeting after organizing adjourned until Friday afternoon, Dec. 21st, when the question of a bench show will come up for action. That the club will give one is an assurance, and probably in close proximity with the Westminster exhibition, as many of the best Western dogs will then be East, and it is hoped that some of the English breeders, who may be in the country at that time, will be present with exhibits. The great difficulty will be to procure a building suited to this purpose, as the Tabernacle, which is well-adapted to it, is consecrated to religious uses, and it will be hard to find another building of sufficient size. As matters progress you may expect to hear full particulars from

H. C.

**THE WESTMINSTER KENNEL CLUB.**—The Westminster Kennel Club last Saturday filed their articles of incorporation in the County Clerk's office. It is stated that the objects of the society are to collect, own, hire, sell, exhibit, board and train dogs; to build and establish kennels necessary for such purposes; to study and improve the breed of dogs, and to provide a club house where members may meet for lawful sporting purposes. The incorporators are: Le Grand B. Cannon, Alexander S. Webb, C. de Bris Wagstaff, William M. Tilton, Henry W. Webb, William A. Morgan, William Seward Webb, George de Forrest Grant and Frederick K. Barnard.

**DANDIE DINMONT.**—A correspondent writes us: "Dandie Dinmonts are rare even in England. In this country good dogs are very scarce. Col. George Post, of Basking Ridge, N. J., is said to have as good dogs of this rare breed as there are anywhere, having them from English kennels, where they are bred purely and are used for field purposes, such as badger drawing, other hunting (a most trying ordeal for the gamest dogs), and the general pursuit of varmints."

**A PLUCKY FOX.**—Our German contemporary, the *Deutsche Jagdzeitung*, tells of a brave reynard, and the narrator is the Baroness Von Recum:—"Walking on my grounds near the Argenthaler Forest, accompanied by my three greyhounds, I had not gone far before I discerned in a piece of uncultivated land a fox. I called the dogs, who immediately sprang at the fox. Imagine my surprise when reynard stood his ground and got the better of the dogs. The skirmish took about two minutes, but the fox, refusing to show fight, after a while broke, and the dogs went after him, though eventually reynard made his escape."

**"WHO HAS FOUND THIS BOB-TAILED DOG?"**—We must call upon you again for a Black Dog, between a Greyhound and a Spaniel, no white about him, only a streak in his Breast, and Tayl a little bobbed. It is His Majesties own Dog, and doubtless was stolen, for the Dog was not born nor bred in England, and would never forsake his Master. Whosoever finds him may acquaint any at Whitehall, for the dog was better known at Court than those who stole him. Will they never leave robbing his majesty? Must he not keep a dog? This dog's place (though better than some imagine) is the only place which nobody offers to beg."

Come, look for this dog, for he is a king's dog, and belongs to his Majesty, King Charles of England, and he went astray in June, A. D., 1660. Alack! That dog, no matter how much Charles can offer us, will never turn up! Still, this advertisement is worth looking at and remembering, for it was the very first of the "Lost and Found." Advertising agents ought to cut it out; it might bring them luck.

**DOG AND FOX CROSS.**—A correspondent writes to the *Live Stock Journal and Fancier's Gazette*: "In answer to your correspondent's inquiry, I beg to state that there is no difficulty in obtaining the dog and fox cross. It was a tame dog

fox which warded my terrier bitch; but I have seen no less than three colley bitches throw pups that were undoubtedly half fox. Now, these cases must have occurred in the hills. Your correspondent is surely aware that when animals are in season they are not at all particular, but I would strongly advise him not to have anything to do with such a cross, or they may play him as bad a 'plisky' as they did me."

—Mr. E. F. Hardy's dog pup Ranger, which took first prize in native English setter pups at Philadelphia, has been sold to Mr. John Sartori, of Philadelphia.

**VISITS.**—Nov. 3, 1877.—Mr. J. C. Higgins, Delaware City, pure Laverack setter bitch Petrel, to Mr. C. H. Raymond's pure Laverack setter, Pride of the Border, at Fox Farm, Morris Plains, N. J.

Dec. 1, 1877.—Mr. C. H. Raymond's, Fox Farm, Morris Plains, N. J., pure Laverack setter bitch Fairy, to Mr. J. C. Higgins, Delaware City, Del., field trial setter Lincoln (Dan-Lill II.).

Dec. 4.—The pure Laverack setter, Fairy II., the property of Mr. W. H. Gumbes, Oaks Station, Montgomery Co., Pa., visited the pure Laverack stud dog Pride of the Border, owned by Mr. C. H. Raymond, of Fox Farm, Morris Plains, N. J.

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Sea and River Fishing.

## FISH IN SEASON IN DECEMBER.

Black Bass, *Micropterus salmoides*; Yellow Perch, *Perca flavescens*.  
M. nigricans. Sea Bass, *Sciaenops ocellatus*.  
Pike or Pickerel, *Esox lucius*. White Perch, *Morone americana*.

**FISH IN MARKET.**—At Mr. Blackford's this week a smelt of extraordinary size was exhibited. It measured 13½ inches in length, weighed half a pound, and was caught in Lake Champlain. The bluefishing of the Virginia coast has been disastrous this winter, and a good many thousands of dollars have been sunk. The fish are in plenty some fifteen or twenty miles out at sea, where they find food in abundance, but will not approach the coast. The loss of this fish to New York is quite an item, since it is from the fall supply of the bluefish that the stock in the refrigerators is supplied. Our quotations are: Bass, 20 to 25 cents; smelts, 20; bluefish, 15; salmon, frozen, 30; mackerel, 15 to 25; Southern shad, \$1.50; white perch, 15 cents; Spanish mackerel, 35; green turtle, 18; terrapin, \$18; frost fish, 8 cents; halibut, 18; haddock, 8; codfish, 8; blackfish, 15; herring, 6; flounders, 12½; cels, 18; lobsters, 10; sheephead, 25; scollops, per gallon, \$1.25; soft clams, per 100, 30 to 60 cents; whitefish, 18; pickerel, 15; sunfish, 10; perch, 10; salmon trout, 18; black bass, 18; hard crabs, per 100, \$3; soft crabs, per dozen, \$1.

**FISHING MOVEMENTS.**—There have been 14 arrivals of the fleet the past week—8 from the Banks, 5 from Georges and 1 from the South, mackereling. The receipts have been 182,000 lbs. halibut, 40,000 lbs. codfish, and 100 bbls. of mackerel. The continued presence of the schools of fish just off the Cape, and the continued good weather seems providential, as the oldest among the fishermen cannot recollect of such another instance, at this season, when the fish have proved so large, so near in shore and so plentiful.—*Cape Ann Advertiser*, Dec. 14.

**WISCONSIN—Menasha, Dec. 16.**—I enclose clipping from *Ashland Press*, account of killing moose on line of Wisconsin Central Railroad. Another has since been killed in same vicinity. Skin of first weighed sixty pounds. Fall shooting here not very good. Ducks unusually shy. Deer plenty thirty miles to the West.

Joseph Hasper, the Butternut bear hunter, has appeared in a new role. On Friday last Mr. Edward Burns discovered a moose just outside the door yard of the Baternut Hotel, and as Mr. Moose disappeared before Ed. could get his gun, he informed Mr. Harper, who immediately put himself on the trail and made moose meat of the unfortunate visitor, after following him about four miles. It was a female critter, and dressed over 750 pounds. Mr. Hart, our informant, says he should judge that she stood near seven feet high.

[This is an event in sporting annals worth chronicling. It is quite likely that Wisconsin affords even better sport of this kind than Maine. The range of the moose is from Cape Breton to Washington Territory.—Ed. F. AND S.]

**SOME RELICS OF ANCIENT SPORT.**—We have received two precious diminutive midge flies from Dr. T. Garlick, of Ohio, which we shall ever preserve and cherish by reason of their associations. The venerable doctor, although afflicted and obliged to write reclining on a lounge, retains all his early enthusiasm for sport, as a reference to the following lines will determine:

BEDFORD, Ohio.

CHARLES HALLOCK: Dear Sir—I enclose two Irish midge flies, one of which has the credit of having landed a trout of two pounds and a half, less one ounce, by my Indian guide, George Puckanash, who lives at the Sault Ste. Marie, the best bark-canoeman and fly fisher I ever saw. The trout mentioned above was caught in Garden River, some eight or ten miles below the Sault Ste. Marie. George had on his casting line two of these little midge flies, and a larger one, the end

T. GARLICK.

FLORIDA, IN 1877.

—Capt. Geo. W. Wilson, a Meriden sportsman, gives as his opinion, founded on observation and study, that the use of Paris green for the destruction of potato bugs is proving death to the quail, as quite a number of birds have been found dead with crops full of the bugs; examination showing that they retained enough of the mineral used for extermination to act on a higher grade of life.

GAME NOW IN SEASON.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets etc., coming under the group *Limacolor*, or Shore Birds.

MISSISSIPPI—*Natchez, Dec. 11.*—A few days ago four members of the Gaillard Sporting Club made a reconnaissance into the swamp toward Gaillard's Lake lying between Natchez and Woodville. They returned after a pleasant trip with 2 fine ducks, a wild turkey, 60 or 70 ducks, squirrels, rabbits, partridges and snipe. The swamps are at present full of r in water, consequently not much game could be taken near the lake reached, but the greatest abundance and variety of game was seen. Wild turkey hunting in the spring promises to be fine. Wild ducks in any quantities are feeding in the swamps at present. Hydrophobia exists to almost an alarming extent here. Recently a member of the club was obliged to let two fine pointers, they having been bitten by a rabid dog. At a match at glass balls on Dec. 1st between several members of the "G. S. C." Mr. John F. Jenkins was the winner of a fine Boston shooting suit, awarded by the club. W. D. J.

C. C. PETTIT.

SHOTS AT RUNNING DEER.

MENOMONZEE, Wisconsin, Dec. 8, 1877.

EDITOR FOREST AND STREAM:

I was much pleased with the letters of your correspondent, J. S. Van Dyke, on "Shooting Running Deer with the Rifle." I now write to ask that more deer hunters of ripe experience will, in a like unselfish manner with Mr. Van Dyke, give their views, practice and experience through your columns. Very few hunters will agree with him on the distance which he claims the aim should be ahead of the running deer when the trigger is pulled. Some of our oldest hunters say the best way is to follow the motion of the deer with the rifle, and when the aim is good and low on the shoulder, fire, and more particularly just as the deer rights from his bound, or is commencing to rise for the next leap.

I think the lateral motion of the gun is communicated to the bullet, which gives it advance enough. Besides, at that instant of time, when the deer reaches the ground, he is practically, if not almost absolutely, in a state of rest, and fortunate is he who, by natural gift or long practice, can at that moment combine the quickness and coolness of aim with the instantaneous obedience of the trigger finger, which shall insure success.

Others affirm that the best way is to carry the aim ahead of the deer, in line of his sight, and "when he jumps into the sights, pull." The "shot-gun aim," alluded to by your correspondent will do only when in thick brush and but one bound of the deer is seen, perhaps his white stern toward you, and, "like a snowflake in the river—a moment white then gone \* \* \*". Yes, tell me whither? A snap-shot, then, in the shot-gun style is admissible, and the only hope for venison.

Yours truly,

DEER HUNTER.

## DECOYING DUCKS.

EDITOR, FOREST AND STREAM AND ROD AND GUN:

Sir—Reading your article in your paper of the 28th ult. in relation to a cat decoying ducks, and asking if any of your readers could give further information of a like nature, I thought I would send you the following:

I have used a dog to decoy ducks ever since I have used a gun, which is forty years or more, but as the variety in my section is limited I have not tried this experiment on my ducks. A small brown dog I think the best, trained to run back and forth along the edge of the shore, in

## Answers to Correspondents.

## No Notice Taken of Anonymous Communications.

**ED.** A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

**R. R., New York.**—Your conundrum is as old as the hills.

**L. G. F., Boston.**—Will you please send your address to this office?

**S. H., Elmira.**—Is there a paper shell made same size of the metallic shell marked 12 A? **Ans.** No.

**F. A. P., Fort Walla Walla.**—Do not think we have neglected your query, it will take some time to get the pedigree accurately.

**G. A. P., Toledo.**—What is considered a good target at 40 yds., using 1 oz. No. 6 shot? **Ans.** 200 pellets. Your answer is correct.

**H., Boston.**—Please inform me through your next issue the size shot that Captain Bogardus uses in glass ball shooting? **Ans.** No. 8.

**C. E. C., Hanover, Me.**—How can I stain a bright iron rifle barrel to a black, or blue-black color? **Ans.** It is done by heat. We do not understand the process.

**YMASSE.**—We cannot designate, except at great length, the flies used for various kinds of fish caught in Florida waters. For full instructions see Hallock's "Gazetteer."

**H., Brooklyn.**—Would you advise use of cantharides, or may the desired end be attained in another way? **Ans.** Association with the opposite sex the best and most natural means.

**DEALER.**—The sale of venison in this State is prohibited after Jan. 1. December is a close month for deer. Deer shooting is allowed only during the months of September, October and November.

**C. V. R. T., Vincennes.**—Please inform me what it will cost to have a double-barrel muzzle-loading gun changed into breech-loader? **Ans.** Depends very much who does the job and how it is done; from \$10 to \$25.

**S. J. L., Norristown.**—1. Can a person shoot as true over water as he can on land, providing he knows the distance? 2. Does water draw a bullet? **Ans.** 1. No possible difference. 2. An old woman's idea. It does not.

**C. W. H., Fort Plain.**—Will you please inform me through the columns of your paper, whether Capt. Bogardus has more than one arm? **Ans.** You have got names mixed; it is Ward, of Canada, who has but one arm.

**C. H. F., Fort Henry.**—At the early age of seven weeks it is difficult to say what may be the matter. Probably mal-nutrition, or some inherited constitutional trouble; or worms often cause symptoms similar to those you mention.

**Z. Z.**—Can you recommend the — gun advertised in your paper? The rifle—large calibre and slow twist—spoken of in the "Sportsman's Gazetteer," would it shoot explosive balls? **Ans.** We have never seen the gun. It would.

**W. C. H., Hagerstown.**—I have a setter bitch which will hunt splendid until afternoon, and then she is taken with pains in her limbs which make her howl. **Ans.** Probably has rheumatism. Keep the bowels open and give warm, dry food and some sulphur once a week.

**J. G. A., New York.**—Can you inform me where I can have a net for a game bag made? Those which are in the game bags purchased at stores are almost worthless. **Ans.** Make it. Go to any cordage and wire store and you can get the information how to make the net.

**J. N. K., Ayer, Mass.**—Have a setter pup ten weeks old. His forelegs are badly crooked. Will they be likely to come out all right and straight? **Ans.** Dogs are sometimes rachitic when young, but almost always, unless positively deformed, the legs come straight in time.

**J. J. S.**—1. I own a pair of maltese cats which are covered with fleas and has the mange. 1 have used insect powder, but it did no good. 2. Are the — good gunmakers? 3. When is the time up for shooting quail in Pennsylvania? **Ans.** 1. Wash with carbolic soap. 2. Yes. 3. Dec. 15.

**J. J. M., Boston.**—A Newfoundland dog, one and one-half years old, has sores on the inside of his ears. **Ans.** Fit a linen cap over the head so as to prevent the ears being shaken; and, then, once a day, wash the ears with tepid water, and afterward pour in a little weak lead water. Feed no meat for a month.

**F. J. W., West Meriden.**—1. Will a muzzle-loading gun shoot as well as a breech-loader, everything else being equal? 2. What makes my gun kick ducks on a cold morning better after firing a few times than at first shot? **Ans.** 1. It will. 2. The difference, if any, must be more with you than with the gun.

**SUBSCRIBER.** Matewan, N. J.—Where, near Washington City, can I find good shooting between the holidays? If any place for partridge or quail, how can it be reached most easily? **Ans.** Orange Co., Va., near the headwaters of the Pamunkey; also, near Manassas Junction, and at Tee Bee, Nottingham and Marlboro, in Maryland.

**NOVA SCOTIA YACHT SQUADRON.** Halifax, N. S.—1. What is your subscription per annum, postage free? 2. Can the year begin with any number? 3. And, above all, do you devote space to the discussion of yachting subjects? **Ans.** 1. \$1. 2. Yes. 3. A great deal. We are publishing a series of illustrated articles on marine architecture now.

**G. W. C.**—Have a bitch eleven years old with a difficulty in her breathing. Holds her head unnaturally; is restless. Malady seems to have been coming on for two months. What is the matter, and what shall I do? **Ans.** Probably has bronchitis. Keep her dry and comfortable; bowels open and good nutritious food. Age is against her.

**G. A. S., Westfield.**—1. Can I get a breech-loading gun of good quality for from \$50 to \$75? 2. How do — guns rank with English make? 3. Do you consider the — action as good as the top-snap? **Ans.** 1. Certainly. 2. An excellent gun. 3. Great diversity of opinion. We have no fault to find with the make you mention. Have one now in use for years.

**NEW SUBSCRIBER.** Painsville.—Will you please answer through this week's paper what is the best American breech-loading shot-gun for the price, from \$40 to \$80? 2. What gauge, 10 or 12, for general shooting, is the best? **Ans.** 1. We would do an injustice to our many patrons were we to discriminate. From good makers it is hard to get bad guns. 2. No. 12, decidedly.

**H. L., Port Richmond.**—My gun barrel is three and three-fifths inches long, about six and one-quarter sixteenths at the nipples, then decreases to muzzle, etc. 2. What is a gauge? 3. Was not Courtney many years ago defeated by a Dempsey? **Ans.** 1. Could not say unless we saw the gun. 2. Not so easy to answer. In old times, before the time of choke-bore, the muzzle was gauged by a certain standard. Now, choke-bore may take a 12 cartridge at the breech, and show a 14 gauge on the muzzle. This could not be called a 14-gauge gun. 3. Courtney was not defeated.

**T. P. W., Wolf Run.**—1. Have you the volume of F. and S. for 1875? 2. Is there a publication called "The American Checker Player?" 3. What breech-loader won in England? 4. Am having barrels made; how many pellets should I put into a 30 in. target at 25 yds., with No. 8 shot? **Ans.** 1. Yes. 2. Do not know of it. 3. Greener. 4. With 1½ oz. shot something like 800.

**J. L. P., Yorkville.**—Would a 32 calibre rifle be as accurate as a target rifle at 300 yds.? 2. Would it hurt a long-range rifle to shoot it without cleaning (charge 90 grs. powder, 1 wd. 1 lubricator and a 300 grs. ball) at short range for long-range purposes? 3. Could I use 73 to 89 grs. powder, etc.? **Ans.** 1. It would not be accurate. 2. Would not hurt it, but would make bad shooting. 3. Would not work well.

**TRAP.**—1. Will you please tell me if the Remington carbine is accurate at 200 yards? 2. What is the price of the same? 3. Would it be allowed in shooting matches under Creedmoor rules? 4. Where can the rules for target shooting be obtained? 5. What is the price of the same? **Ans.** 1. It is. 2. \$16. 3. It would be. 4. We have them; send ten cents in postage stamps and we will forward them.

**A. B. C., Boston.**—1. What kind of wad did the American team use in their cartridges? 2. Do they lubricate by passing an oiled rag through the barrel? 3. I have a Remington shell holding 97 grains, how shall I fill it with 100 grains? **Ans.** 1. Pasteboard wad. 2. With an oiled rag. 3. Have a tin funnel made with a long spout so as to get a good fall to the powder; load in this way and you will put in the three extra grains, by careful manipulation.

**W. J. R., New York.**—Do the straight shells for central fire rifles have any advantage over the bottle-necked shape in the way of less recoil? 2. For squirrel and coon shooting and other small game, will a 32 calibre rifle, rim fire ammunition, answer the purpose as well as a 38 calibre would? 3. Do you think the 32 ammunition would be reliable up to 30 rods? **Ans.** 1. We never found any appreciable difference. 2. 32 is good; would prefer 35. 3. Only moderately so.

**A. W. S., Norfolk.**—Has the genuine Gordon any white on his breast? **Ans.** Idstone says: "The tan (of the Gordon setter) should be raven black, with a blue or plain bloom on the bright lights. \* \* \* There is no objection to a white shirt frill, although the absence of all white is a good thing." Further, Idstone says, "The very best blood occasionally shows the color (white), and there can be little doubt that in the Gordon kennels it is often met with." See Hallock's "Sportsman's Gazetteer."

**SPLASHER.**—1. Please tell me what to do for a dog the soles of whose feet crack open, exposing the quick and keeping him constantly lame at this time of year? The trouble begins as soon as the ground freezes. He runs loose, has plenty of room, sleeps where he pleases and is fed on scraps from the table with the addition of some plain corn bread. 2. Whose invention, or patent, is the rebounding lock used on the — gun? **Ans.** 1. Wash the feet regularly with strong salt and water for a few weeks. 2. The inventor's name we do not know.

**C. W. F., Brooklyn.**—Could a side forward lever of a breech-loading Scott gun be changed to a top-lever—that is, back of the hammers. 2. I tried my gun, and found at 40 yds., target 28 in. diameter, it put in 101 pellets; at 60 yds., same size target, 53 pellets; do you consider it fair shooting, as I had a 7 lbs. gun, 3 drs. powder, 1-15 oz. No. 7 shot? 3. Down to what large shot would a 12 bore breech-loader, 7 lbs., shoot with advantage? **Ans.** 1. Believe that the change would be injudicious, and would not advise it. 2. Excellent target. 3. Could not answer. The experiment should be tried by you; guns have their idiosyncrasies.

**J. W. D., Ottawa.**—Will you kindly insert a receipt for tanning animal pelts: also, the way to cure bird skins for stuffing? **Ans.** Put the pelts in a pickle of alum and saltpetre until they become like leather; then dress the flesh side, dry slowly, rub them with butter, and dry by treading them out in sawdust. Equal parts of salt, alum, Glander salts and half a pint of saltpetre, make a good and cheap mixture. For bird skins: After careful skinning, powder with one part powdered saltpetre and six of alum. Carbolic acid in solution is good. Put pieces of tow or cotton steeped in the carbolic acid solution in vent and throat. See "Sportsman's Gazetteer" for full particulars.

**J. J. M., Montreal.**—1. Pray give me the names of secretaries of yacht clubs who own boats of from nineteen to twenty-five feet keel. 2. What is your definition of the word professional as far as regards yachting? **Ans.** (We beg to state to our correspondent that his first letter never came to hand.) 1. Address F. de P. Foster, New York address club, Wall St., New York. 2. H. H. Mann, Wall St., New York. Address letters to secretaries of Atlantic, of Brooklyn, and Columbia yacht clubs of New York. 2. By professional is meant any person who has at any time during his life followed the water as a profession, or for means of subsistence, or in any way received pay for services rendered on any boat, steamboat, sailing vessel, etc.

**H. S. K., Burlington, Vt.**—A buys a horse of B, agreeing to pay \$500 for the same. B says to A, "When you pay me for that horse I want you to give me \$750 before a crowd for effect." A asked a friend of B's if he would see that he got back \$250 if he paid B \$750, saying that he would see that he got the amount back. A goes into the hotel and says to B before the crowd, "Guess that I will pay you for that horse now," and pulls out his money, and counts out seven one hundred, and one fifty dollar bill, and handed them to B saying, "There, I believe that makes us square?" after which B meets A and gives him back \$50, as agreed on. B then makes a bet with C that he (B) received \$750 for the horse. Who wins the bet, which was \$25 aside? **Ans.** C wins the bet. B most assuredly did not receive \$750 for his horse, and played a disreputable and black-leg game in pretending that he did.

**LAREDO.**—Please inform me which is the best locality for agriculture and sheep raising—California, New Mexico, Arizona, or Texas? **Ans.** We cannot answer categorically, except as to Arizona, in respect to which we give the testimony of the *Citizen*, a paper published in that Territory, which says decidedly that "There is no opportunity for agricultural colonies to thrive here, because at this time no large body of unoccupied land with water can be obtained. The worst features of common colonists is the certain disappointment, because of the false basis and information upon which they are induced to come. It is safe for the Eastern press to discourage the formation of colonies for Arizona." As to California, it is liable to periods of drought and flood, both of which have destroyed sheep by tens of thousands. Over 100,000 sheep perished by starvation there last year. With guaranteed immunity from these contingencies we should recommend California. Texas and New Mexico offer many most desirable grazing and agricultural localities. The latter is nearest a market. Any one going into the business of sheep culture should start with a capital of \$5,000.

**NOTICE TO SPORTSMEN.**—Having received so many communication asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—Adv. ABBEY & IMBRIE, 39 Maiden Lane.

## New Publications.

**HALLOCK'S SPORTSMAN'S GAZETTEER ABROAD.**—As evidence of the appreciation in which this popular cyclopedia is held abroad, we are pleased to state that it is now being reprinted at Paris and Leipzig in the French and German languages, by permission of the holders of the copyright. A like application has also been made by a prominent London publisher. From its first appearance it has received very favorable comment from the foreign press, as well as from residents of foreign countries. The following letter is from Prof. D. G. Elliott, F. R. S., F. L. S., etc., who is the author of many comprehensive and valued works on fauna, more especially in ornithology. At this moment he is engaged in a specific work on Hornbills:

5 RUE TILSETT, PARIS.

MR. CHARLES HALLOCK:

My opinion of your work can be summed up in a very few words, viz.: That it is altogether the most comprehensive and valuable publication of the kind ever brought out in America. I cannot see what any sportsman needs more, and if he don't find all the information upon the subjects of food and field, and the things pertaining thereto, which he desires, he must be an unreasonable creature and a curious sportsman. I heartily congratulate you, and wish the book all the success it deserves, which, of course, will be very great.

F. Von Guerners, late of *Der Waldmann*, now of *Der Deutschen Jagdzeitung*, Leipzig, Germany, writes:

It is a selection of all that the hunter and shooter wants to know and although I believe I know a good deal about hunting matters, and that which you call "woodcraft," I am very glad to confess that I found many things which were new to me. I intend to print a critical review of it in one of my next issues, and to illustrate it with your portrait and a brief biography. I am sure to provide you a good lot of purchasers for your excellent book, which I would warmly recommend.

[From *Chasse Illustrée*, Paris.]

Perhaps one of the best known of our sportsmen, understood in its proper sense, and who writes most intelligently on hunting and fishing topics, is Mr. Charles Hallock, the editor of the *FOREST AND STREAM*, of New York. Mr. Hallock has just published a work called the "Sportsman's Gazetteer," which is worthy of being translated into all European languages. We are very anxious that this remarkable book should be interpreted by us into French. In its text may be found everything which relates to hunting and fishing in America, with the fullest details as to the habits of all the creatures, whether of the field or food, which man engages in capturing. In addition, the work furnishes the most complete instruction as to the methods of shooting and fishing, with details of an interesting character in regard to a life in the woods. Here, too, may be found a map, and a guide into the best sections of the United States where game is found. It should be remembered that Mr. Charles Hallock is no apprentice in either woodcraft or book-making, as he is the author of two standard publications, "The Fishing Tourist" and "Camp Life in Florida." The title Mr. Hallock has adopted for his work, "The Sportsman's Gazetteer," is no pompous sign; such as one sometimes sees over an empty shop. The writer is not one of those authors who manufacture books about travel, or of hunting incidents, from their inner consciousness, taking their inspirations from their study room. What Mr. Hallock writes about he has seen himself, and he tells his own experiences. He talks about what he knows, and does not care for other people's hearsays. In a single word, it is a living, positive book. Any one who wants information in regard to game in the United States will find all he requires in the "Sportsman's Gazetteer." In the eight hundred pages which make up the complement of the book, there is not a single leaf which does not impart some useful lesson. Something more, in addition to the facts imparted in this excellent work, there is this, that the author possesses a certain elegance and vigor of style which makes the "Sportsman's Gazetteer" most pleasant and instructive reading.

[From *Land and Water*, London.]

A few pages of introduction in backward taxidermy, and a bibliographic list for sportsmen, bring us to the latter division of the "Gazetteer," which termination, like a postscript to a lady's letter, is perhaps the most important part of the work. This part is entitled "Sportsman's Directory to the Principal Resorts for Game and Fish in North America." Each State of the Union is dealt with separately. A sketch of physical features being given in general terms, and its character as a game bearing region stated. Each county of the State is then dealt with in detail. The varieties of game and fish found in its forests and plains, rivers and lakes; the best routes for travelling to them, the kind of accommodation attainable, and indeed almost any kind of information the sportsman can require. The whole is supplemented by some excellent maps, which enable the intending sportsman—*voyageur*—to ascertain at a glance the exact position of the district he purposes visiting, and quickly aids him in determining the distance from them to other grounds which he may desire to visit, etc. On the whole, Mr. Hallock's book contains a vast amount of useful information, useful of course to the sporting fraternity of his own country in particular, and to those speaking the English language going to the States on sporting expeditions, and we think the author has not overvalued his work in expressing his willingness to allow it to stand on its own merits alone.

[From the *London Field*.]

Mr. Hallock, the author of "The Fishing Tourist" and the editor of *FOREST AND STREAM* (the New York *Field*), has given us a book that was very much wanted, not only in New York, but here. A more complete and comprehensive work than the "Sportsman's Gazetteer" probably has never been produced by any sportsman. It does not matter what you want to know in reference to American sport—whether it be a recipe to kill mosquitoes, or how to get hold of a salmon river, or where to get the finest cariboo and moose hunting. From the lowest to the highest, every interest in sport is here represented, weighed and filtered in the most convenient parcels. \* \* \* Mr. Hallock has displayed very great energy, patience and perseverance in collecting so vast a mass of valuable sporting information. His book, indeed, is half a dozen books in one—sporting, "national, historical," "medical," "topographical," "practical," and let us hope beyond all, as a wind up, and as it deserves to be to the author, that the work will be "prontable."

**AN EXILE FROM POLAND.**—By Ringgold McGay: Rogers & Sherwood, New York, printers.

This is an Epic far more than average merit, whose scenes are laid partly in the American wilderness and partly in baronial halls of Poland. In the course of the narrative, which is sanely diversified with music, flowers, forests, love, jealousy, clash of arms and tragic incidents, to give it piquancy and zest, the causes that led to the hero's exile from Poland to America fully appear. The interest of the story is fully sustained throughout, and the denouement follows with dramatic effect. Mr. McGay is a painstaking writer, who has the natural gift of poetry, and we venture to say that his very few efforts which he has made hitherto are more worthy a place of honor than a majority of so-called poems which have been lauded beyond their merits. The volume comprises 160 pages of tinted paper, and will make a very pretty holiday token and companion for the parlor table.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INFLUENCE OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2332.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements must be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\*\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 20, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for delinquency of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,

Business Manager.

Western Manager.

## A MERRY CHRISTMAS.

Although Christmas is not here yet, for we pen these lines some five days in anticipation of the event, we are certain our many friends and readers will accept our congratulations on the coming festivities.

Christmas presents itself this year almost in the guise of spring, with summer skies and balmy breezes, and has forgotten snow flurries and chilliness. Let us bless the holiday as it comes, not grumble because ducks are scarce and sportsmen have not had their full innings so far. If the sportsmen are disappointed the ducks rejoice. Let, then, Christmas imbue us all with a holy, a contented and a cheerful spirit, for does it not bring with it the remembrance of Him who brought peace and happiness to the earth?

SOME GRUMBING.—We beg to state that, although we are generally in the best of humor, we get riled at times when we are held to account for the character of the goods advertised by us. Do our many friends want us to give written guarantees as to the infinite variety of things which find publicity in our columns, from a five cent dog whistle to a \$1,000 Laverack? Are we to swallow all the medicines, drink all the champagne and brandy, and dress in all the shooting suits, or wash ourselves in the soaps? We are really tired of being keel-hauled. Of course if we ever find fraud exercised through the medium of our columns we will expose such swindlers, as we are not mealy-mouthed in handling such geutry. In the present case, some gentlemen, members of a sporting club, are disposed to drag us over the coals about a \$5 rifle advertised in this paper. In this instance we have taken the trouble to see the rifle, and have had the opinion of a leading arm expert on the subject. The rifle is declared dirt-cheap at \$5, as it cost the government \$23 by the 10,000. It is not a Creedmoor match rifle, and not of the kind used at matches. The mistake people make is to expect a \$175 rifle for \$5, and that is not our fault.

## BLOOMING GROVE PARK.

It has not taken us many years to appreciate fully the absolute necessity of having as part and parcel of every large city, certain extensive grounds where green trees, shady walks, broad expanses of lawn, with lakes and flowing streams, give health and recreation to the people; still something more was requisite, and just here private enterprise has entered to fill a public want. Some six years ago certain gentlemen conceived a plan which would combine within itself all the departments of fish culture, timber culture, the breeding of game, which would be appreciated alike by the lovers of field sports and those seeking profitable investments. It was obvious that the rapid progress of the railroads, the increase of population, was fast converting the haunts of the larger species of wild game into farms, and that those fond of the pleasure and excitement of the chase would be compelled to forego it, unless they had the means and time to travel to the far West. The idea was to purchase and control an area of land, presenting all necessary advantages, and accordingly in March, 1871, a charter was granted to the organizers of the Blooming Grove Park Association empowering them to purchase lands in Pike and Munroe Counties, Penn. Under a most valuable charter the Blooming Grove Park Association holds titles to 12,000 acres of ground with improvements. This territory is large enough to be the appenage of a German Duke. Its forests include all varieties of trees, such as the oak, hemlock, chestnut, beach, spruce, cedar, maple, birch and pine. In animals there are found there the bear, wild-cat, fisher, otter, mink, fox, coon, deer and varieties of the squirrel and rabbit. In birds there are hawks, eagles, ducks, quail, woodcock and ruffed grouse. In the numerous lakes and streams belonging to the association bass, pike and trout are found in quantity. One most pleasing feature of the Association is that every member is a shareholder. All these advantages are not a thousand or more miles from New York, but within six hours of pleasant railroad travel.

The object of this Association is not simply that of furnishing amusement for the individual members; it has a higher object in view. Its aim is to propagate and preserve all game animals, birds and fish adapted to the climate, to cultivate the forests, to supply the eggs of fish and the young of animals, and finally to give the fullest development to field and aquatic sports.

Such a vast enterprise as that of the Blooming Grove Park, so well conceived, has from its very commencement fairly succeeded; though a certain few gentlemen, shrewd enough to see into the future, have thus far borne almost alone by themselves the larger part of the expenses. The executive committee of the Blooming Grove Park Association, believing, however, that its sphere of usefulness could be increased, and that a more general co-operation would be advantageous, have framed a most liberal proposition, which we now present, and to which we invite the serious attention of all persons interested in game protection and out-of-door sports:

OFFICE OF BLOOMING GROVE PARK ASSOCIATION, }  
No. 37 Park Row, New York, Dec. 1, 1877.

To the Members of the Blooming Grove Park Association:

GENTLEMEN—It is proposed to renew the bonds of the Association, increase its membership, and take advantage of a proposition made by one of its members, to make certain valuable improvements on its property, at his individual expense. To this end the earnest co-operation of all the members will be necessary.

We submit herewith, confidentially, the present condition of the Association. You will thus be able to place the matter in its proper light to proposed members. The bonds on the property, represent, as far as they go, dollar for dollar, cash actually expended for and on the property. \* \* \* \* \* Over \$21,000 has been put into buildings, breeding-yards, etc. Besides this sum, over \$9,000 cash has been expended by one of its organizers, which sum is cancelled and no claim made, besides many other considerable sums by its different officers. The Association has no other indebtedness. No salaries have been, nor are, paid to any of its officers. It holds a valuable charter, and titles to about 12,000 acres of ground, with improvements. Its capital stock is \$225,000, divided into 500 shares of the par value of \$450 each, with power to increase its capital to \$500,000, and own 50,000 acres of land. There is no personal liability. But a comparatively small part of the capital stock is now out, so that its resources are ample.

For any further financial details, apply to one of the Executive Committee. For other information, see pamphlet and charter. \* \* \* Mr. Payette S. Giles has placed at the disposition of the Association \$7,500 of his own bonds, on condition that the Association issue, during the coming winter, not less than 150 memberships, to the proper parties, one membership each, free on condition each new member to take a \$50 bond at par, cash. If 150 are sold, Mr. Giles proposes to spend the \$7,500 thus obtained about as follows:

|   |         |
|---|---------|
| Road to Park House.....   | \$ 600  |
| Furniture to Park House.....  | 2,000   |
| Mule Team, Yoke of Oxen, Carriages, Carts.....  | 1,000   |
| Sono Wall around Breeding Park, with wire on top—Dog, Deer and Bird Proof Trout Works—the labor to be performed with our teams..... | 1,500   |
| Ornamental Grounds at Park House.....   | 500     |
| Boats at Park House.....  | 300     |
| Boats on other lakes.....   | 200     |
| Three Gamekeepers' Lodges, at \$300.....  | 900     |
| Margin.....   | 500     |
| Total.....  | \$7,500 |

If \$300 are obtained on same terms and in same time, Mr. Giles proposes to furnish \$7,500 more bonds from those owned by him, and place the \$7,500 cash obtained in trust, to be employed in fencing the whole park in same substantial manner (s one wall and wire), upon the condition that the club will place \$7,500 more with it at the same time, for same purpose. Each share will constitute full membership, and carry with it *pro rata* ownership in all the property and improvements. The members will receive security in bonds for the \$50 cash paid, and draw interest thereon, and may at any

time withdraw from the Association by sale of or returning their shares to the Association. The annual dues have heretofore been \$50 per annum. It is very desirable that they should be considerably reduced. \* \* \* If the 150 additional members are obtained before the first of March, the dues will not exceed \$25 for next year, at any rate, and after that they would depend on the number of members, expenses and incomes from various sources. If 300 members are obtained, as proposed, the dues can be fixed at even a lower rate. They will probably never again be above \$35. In fact, through the very liberal donations of its organizers and different officers, the affairs of the Association have been placed on a new and thoroughly substantial basis. Some members have presented their bonds to the club. Mr. C. H. Read, with his usual liberality, has offered to furnish the money for building a carriage road around Lake Giles, at a cost of several hundred dollars, and substantial offers of aid have been made by other members. We hope to go on rapidly with the improvements tending toward the accomplishment of the great objects of our organization—the cultivation of forests; the preserving, importing, acclimating and breeding of all game and fur-bearing animals; all birds and fishes adapted to the climate, and preventing their extinction; providing the members and their families with an agreeable resort, and to give a full development to field and aquatic sports.

Every effort will be made to increase the attractions for ladies, and the Association expects their presence, aid and participation in its sports and objects.

You will see that the easy terms offered to the limited number of members could not have been made except that the bonds and stock had been presented by the club and members for the purposes herein enumerated, and that the plan contemplating the improvements should be executed without delay. We would beg you to notify us, as soon as possible, of the number of persons you will propose for membership, and trust you will take an active part in the interest of the Association.

Very respectfully yours,

THE EXECUTIVE COMMITTEE. (JOHN AVERY,  
Geo. H. GLENEY,  
Geo. S. GREENE, JR.)

In order to inaugurate a new departure in the affairs of the Blooming Grove Park Association, which we believe must be successful, there will be a Reception and Ball given by this Association at Hoffman House, Jan. 8, 1878, 9½ p. m. Tickets for lady and gent, \$4, including supper.

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 8.

BY THE EDITOR.

DECEMBER 20th.

BROTHER SPORTSMEN: Although these lines are penned upon the eve of Christmas Holidays, my reminiscences are of August angling. A lapse of nearly four months has brought its natural change of seasons. The snow that mantles our northern country makes pleasant contrast to the fervent heats of summer, when the gentlest zephyr was grateful, and the gushing of the cool spring in the shade made sweetest music. The Yule-log burns all the more brightly in the crisp atmosphere of our lower temperature. Its ruddy reflection upon the yew and holly which decorate our homes is as cheerful as the blaze that played fantastically among the pines and spruces when we camped *al fresco* upon the shores of Lake Superior. Now the peal of the Christmas carol rings out; now the clatter of the sleigh-bells is merry; the voice of the noisy brook that babbled among the stones in summer is hushed, and only its gurgle can be heard under the ice. As we swing with measured cadence over its transparent surface, the mid-day sun glints from our skates. We seem to tread on nothing. The long weeds underneath float and sway in the imprisoned current, and we see fish lying at rest or darting among them like creatures in an aquarium with only a glass between us. Hail! boon companions and beguilers of our joyous summer hours! Thanks for the winter locks and icy chains which guard and preserve you from the greed of unconscionable fishermen!

It was among the latter days of August when the porter toted my camp-kit into the spacious reception hall of the Chequamegon House at Ashland, Wisconsin. Only a brief open season remained for those who wished to catch trout. It was late for conscientious anglers, and the fish abode no longer in haunts which they pre-empted in spring. They had left the lower waters of the streams which emptied into Chequamegon Bay and moved afar up among the brush and tangle of roots and trunks which filled the upper stream. As for "rock fishing" along the shores, which is the favorite pastime in June, and always the *creme de la creme* of piscatorial sport, it was even asserted it was *nil*; old resident fishermen declared that trout could not be taken among the rocks at all at this season, and at no time except with bait. This was a challenge to provoke a laudable ambition in the breast of an angler accustomed to conquest, and I forthwith essayed to put the question to the test. Accepting the proffer and services of my friends Sam Fifield and Mr. Blank, with their skiff and yacht, we made daily excursions and cruises all along the shores of the bay; we explored the rivers and creeks that came flowing out of the river in great or lesser volume; we poked our bush rods into almost inaccessible places, and we trailed our flies where we had full sweep and plenty of elbow room. Never in my life have I found a locality that offers such an infinite variety of diversion as Ashland and its vicinity. By vicinity I mean the stretch of shore that extends from thence to Bayfield, a distance of sixty miles, and as much farther east or west for forty miles as the enterprise and pluck of the Rambler will take him.

Chequamegon Bay is an arm of Lake Superior, some eight miles long and from three to five miles wide. Its southern shore is a highland. Upon a sand cliff near the head of the Bay the town of Ashland stretches itself for a couple of miles

in a line of scattered houses that face and overlook the bay. A part of this line of houses is known as Bay City. It was settled very many years ago, and being founded on underlying rock has not settled much since. It is supported chiefly by a large lumber interest. There is a road along the cliff, but as it is not more than tolerable, visitors seldom travel it; but boating parties often land at the mill and inspect the huts of the aborigines which are scattered along the beach, constructed of pilfered slabs and drift-wood. After a careful inspection of these Indian waifs none but the benevolent take much stock in them as materials for a romance. They do not even use birch canoes any longer about this section, and the dug-outs they own are 'always leaky, cracked and cranky. I notice they are to send a collection of Indian fabrics and manufactures to the Paris Exposition, but I incline to the belief that the birch canoes, ornamental mats and baskets, mocucks, and carved stone pipes, are as great curiosities in many parts of Lake Superior as they will be in Paris, and that a premium will have to be offered to stir the aboriginal pride to hunt them out, if not to make new ones for the occasion. The red man will not work except for great inducements. The only exercise or labor which he does not ask pay to perform is eating and digestion. To the first he devotes unwonted energy; the latter is only a function which runs itself while the Indian lies still and waits for results. The patience he shows herein is commendable. Sometimes these fellows bring a string of whitefish to the hotel at Ashland, a bit of commercial enterprise stimulated only by dire necessity and an appetite for fire-water. The little papooses are always objects of interest to ladies, to whom their stolid and lumpy physiognomy affords a morning study. Episodes of this sort make variety for those passive guests who do not ramble nor go boating, in the intervals of looking out over the lawn and verge of the cliff upon the blue waters of the sparkling bay and the wooded range of hills that borders the further shore. The site of the Chequamegon House is well-chosen. Two years ago the plateau where it stands was a forest, now it is a well-kept lawn with incipient shade trees and beds of verbenas and geraniums. Next year we shall have water all through the house, and a fountain to play in front of the piazza. There is a well-graded carriage-drive one hundred feet wide between the house and the edge of the bluff, which already extends westwardly to the end of the village. As this drive is all the time in full view of the bay, and crosses three bridges that span romantic ravines, it is very pleasant. The prettiest summer residences in the place front on the road, and a plank sidewalk runs the whole distance. In a ravine at the end of the drive is a lager beer brewery, so that the pedestrian or rider can have an object in view if thirsty. Physiologists say that the value of exercise is much promoted by having an object in view. The turn-spirit takes plenty of exercise, but his life is brief; so also the poor horse which saws wood in the railroad shed, is forever climbing his inclined plane, forever moving on, but getting nowhere, and so dies of monotony and disappointment, before he has lived out half his days or the full measure of his usefulness. This part of Ashland is laid out in three parallel streets with a number of streets intersecting. There are a goodly number of stores, a bank, a printing office and plenty of *ci-devant* hotels which accommodated the very considerable number of visitors who resorted hither before the large hotel was built, tempted by the attraction of the place. The printing office is owned by Hon. Sam Fifield, Esq., ex-representative in the Wisconsin Legislature, who prints a weekly paper called the *Ashland Press*. Mr. Fifield's varied abilities shine forth through its attractive columns, which are advantageously employed in promoting the local interests of his town and county. I have heard it stated that he holds a sort of territorial jurisdiction over the county, and that no editor can leave by the Wisconsin Central road without his pass being vised by his Excellency.

At the foot of the bluff below Mr. Fifield's residence is his boat-house, and a half a mile above and a half a mile below long piers make out from the shelving shore into deep water. One of these piers belongs to the Wisconsin Central Railroad Company, and cost a large sum of money. On the end of each pier is a large warehouse, at which the largest lake steamers land their cargoes and passengers. At regular intervals Capt. Patrick's little steam-yacht, which plies between Ashland and Bayfield, can be seen at her moorings. Captain Blank's yacht lies at the lower pier; several Mackinaw boats and skiffs are seen along shore, so that the little land scape is quite enlivened at all times. The great events of the week, however, are when the large lake steamers from Chicago and Duluth touch at the landing at night. Then the long rows of cabin lights beam forth brilliantly, the guests of the Chequamegon House go on board, and the sound of music and dancing mingles with the escape of the steam.

Below the village of Ashland, and all around the circuit of the bay, an almost unbroken forest remains. At the head of the bay is a little fish house, then comes Fish Creek, one of the best trout streams in the vicinity; directly opposite Ashland is a hay-meadow and barn, with a deserted farm-house, and through the premises a considerable trout-brook runs, where one can throw the fly without obstruction and have the newly-mown field for a carpet to stand on. Three miles further north, on the same side, is an old landing and a mill-site, with a road winding up a very steep bluff to the site of a paper town called Houghton, which a resident of Brooklyn, N. Y., once fondly hoped to transform into a watering-place. There are three deserted houses there—two erect and one fallen. The locality is well chosen and is much visited by picnic par-

ties from Bayfield and Ashland. From this point to the mouth of the Bay and eight miles beyond to Bayfield, there is nothing to interrupt the line of forest. Opposite the mouth of the bay is the Indian village and old mission station, known as La Pointe, a tumble-down, half-deserted place, which offers an objective point to sight-seers, but of which little need be said.

Bayfield is the loveliest town imaginable. Its pretty cottages and private residences of summer visitors are ornamented with court-yards, flower gardens, and gushing fountains, whose perennial supply of water is brought down in pipes from a high ridge of hills behind the town. The streets are wide and regularly laid out. The Island House, kept by William Knight, whose brother is a surgeon in the United States Navy, affords every comfort and convenience, and if one wishes a private boarding-house he can make his selection among the half score that offer. Little piers and private boat-houses dot the crescent shore; yachts lie at anchor here and there; fishing-boats are moving about the foreground; the smoke of a steamer looms up in the distance, and the little village of La Pointe, whose beauty is enhanced by the distance, gleams in the sun like a line of silver on the horizon. Set like a jewel in its amphitheatre of hills, it is encompassed and landlocked by the twenty-two Apostle Islands, whose wooded crowns, resting on their pedestals of red sandstone, seem like emeralds set in garnet, the whole forming a cincture almost unrivalled in physical ornamentation. Right up to their bold, perpendicular shores the largest steamers can run and lie alongside, and when the passenger would go ashore he must land from the hurricane deck. Among the maples and deciduous trees above, the visitors can ramble, while those below can wonder at and explore the caves and crevices cut out of the rock by the waves, which have washed them into fantastic shapes. Every day Captain Patrick's steam-yacht makes its excursion trip among these islands, and where in the world can an excursion more delightful be found? I am pleased with Ashland, but I am in love with Bayfield. Situated only sixteen miles apart, the two villages combined constitute a fulness of attraction seldom found anywhere, and the interchange of visits from either place affords greater pleasure and variety to guests than if the interest were concentrated and not divided. I could write a book on this delightful nook of the famed Lake Superior shore, and when I reached the end and turned back the leaves would find a dozen themes suggested for other books, which persons fond of nature would never tire of studying. Next year I shall visit the spot again (*D. V.*), and see what new charms have developed since I reluctantly left its delightful shores.

All along the rocky shores of Chequamegon and the Apostle Islands, which I have so cursorily referred to lie, in spring time, the great speckled trout whose fame is widespread. In the deeper water swim the *Salmo namaycush*, the huge lake trout, which weigh fifty pounds and more. They can be taken by trolling in June in vast numbers. As to white fish, those only know their excellence who have tasted them fresh from the pure cold waters round about. There are not less than fifty trout streams along these shores, of easy access by steamer, while accessible interior lakes abound in black bass, rock bass, perch, pike and mascalonge, all of which are keen for bait or spoon. A map which gives the names of all the trout streams can be obtained from Mr. Knight, of the Island House, or from Isaac H. Wing, Esq., land agent, at Bayfield. Many of these streams have scarcely been fished by sportsmen.

Although smaller than the speckled trout of the Nipigon River, on the north shore of Lake Superior, they run from one to four lbs. in weight. They are certainly large enough to afford amusement to the most ambitious angler. As "it is not all of life to live," so it is not all of fishing to fish, here. The mind is constantly diverted and occupied by the strange sights one sees, and as the angler's skiff passes from point to point along the base of the sandstone cliff, he seems to move in some enchanted realm, where the caprice of weird beings has created strange shapes, and hewn out abodes for gnomes and genii and inhabitants who live not as men live. The whole face of the perpendicular wall is scarred and seamed and broken; huge rocks, riven by the intense frosts of winter, have been split off from the main body and hurled into the lake, where they lie in monoliths or ragged piles; caves penetrate far into the rock, in whose recesses the waves swash with a mournful cadence, and if one listens on a calm day at some chance crevice he can hear the inner chamber give forth a sonorous and uncertain sound, as if from depths unmeasured. In a storm the great billows roll into the caves and thunder with reverberations that deafen and appal, surging upward and around the concave space, scouring its surface, wearing and enlarging it year by year, until perchance a million tons of rock undermined, give way at last and fall in promiscuous ruin. In many places the cliff is stained with oxides that exude from unknown mineral deposits within, and the frescoes are scarcely less striking than those of the much visited Pictured Rocks further east toward Marquette. High above the level of the lake the unbroken forest waves its fronds, resting on its cliff foundation, great trees clinging to the verge and protruding their naked roots into space, like the tentacles of an octopus reaching out in search of nourishment and finding none; and sometimes when a huge mass of rock splits off the trees fall with it and are hurled into the lake below, where they afford new lurking places for the fish that congregate among their branches and hide under their trunk and roots. The water immediately along shore varies from four to eight feet in depth; two rods away it is four fathoms; a little further out fifteen fathoms and more. It is among these

broken rocks and debris that the trout are found, and it will be seen from the nature of the case that the angler's best method is to sit in his skiff and cast his line in shore, while a comrade uses the paddle when required. There is no lack of casting-room. The whole eight miles of the bay is behind his back, and there is no chance of his line being hung up on the farther bank. Very often excellent opportunities are obtained by getting out upon the piles of rocks; coigns of vantage are also secured by stepping on ledges and hugging the face of the cliff, steadying the poise by grasping a bush with one hand while the other hand dexterously tosses a fly into the mouth of some shadowy cave, and persuades the trout from his element. But it is delicate work to catch fish when the sun shines. The water is clear as crystal. One can see twenty feet into its depths, and the fish can see the angler equally well, and better, for the refraction from the face of the rock reveals every outline of his approaching figure so distinctly that even the expression of his face is limned in the picture, and the wary trout fears Machiavelian arts.

When I went over from Ashland to the rocks in my friend's yacht, I knew well that my skill was under severest scrutiny. They had wagered on shore that I would not lift a trout with flies, but I had no other lure whatever, and so I convinced them. If there were no virtue in soft persuasives, I determined not to use more positive measures. The wind blew a stiff breeze from the southwest, right over the cliffs of the further shore, but our schooner was staunch, some thirty feet in keel, and so we carried all sail bravely until three-fourths of the distance had been accomplished. Then the winds became at once flawy and baffling, sometimes swooping over the cliff in spiteful spurts and heading us off from all points of the compass in succession, and anon dying away to a dead calm; then, all at once, while the sails hung limp and listless, a cat's-paw would jump aboard us, right over the waist. Giving as little sheet as possible, the lively craft would eat up into the wind on the edge of her combings, cutting a semi-circle like a comet. So we would gain a little; but presently the wind would fall again, and the little breath which was vouchsafed us would head us off from the northward. So the capricious breezes continued to play strange antics, alternately giving and taking, until the monotony of our effort to make the shore became tedious. Still the water was too deep for anchoring, and we did not care to raise a white-ash breeze with the skiff and tow-line, so we hung on, my friend to the jib and fore-sheets and I to my main-sheet and tiller, hoping for an inch or two more of advantage, the calm dead as a door-nail, and not a ripple to be seen between ourselves and shore. It looked like an all-day's drift, when suddenly, without any admonition whatever, another flaw jumped over the cliff, and in a twinkling our craft was heeled over, taking water over her combings by the barrel, shifting sand-bags and mixing things generally. It was the work of not more than two seconds. The flaw had come and gone and all was still. We had barely escaped a capsize. Righting things in a few moments we let go our anchor, and, giving all the scope we had, found bottom in eighteen fathoms of water. Making all snug, we took to the skiff and pulled for shore with our lunch and fishing tackle, discussing meanwhile the character of the Lake Superior breezes, which are always either treacherous or stormy.

I had no success at first with my flies, and soon discovered that it was useless to fish in that bright sun and clear water. There was not one favoring condition in the case. So we paddled into a cavern whose roof rose some seven feet above the water, and getting into its shadow twenty feet back from the entrance, lay quiet for a while. Presently a trout came out from under a rock in front of us, and, dropping a fly in the water as if it had fallen from the roof above, we had the satisfaction to see the trout seize it. It was a little six-inch fish, but we had him in the boat in a twinkling, and thereby proved that trout could be taken then and there with flies. Then we addressed ourselves systematically to the business before us. Pushing the skiff quietly to the entrance of the cavern, I cautiously tossed my fly hither and yon among the scattered rocks and along the side of the cliff. No response. Then we pushed out and felt our way little by little, testing every likely place. Presently our reward came. We hung a noble fish, and as he fastened, we backed carefully into deep water and let him play. It was the luxury of sport to follow him wherever his moods led. There was little anxiety about losing him, for we had the whole bay for a circus, and all that was necessary was to keep him well in hand as the rider does his steed, barely feeling his mouth, but having him always in control. When we finally added him to his little mate in the bottom of our craft, I felt that I had triumphed. We afterward caught six more, and then employed our time in rambles about the shore. We were satisfied, and so were our friends after we returned and showed our trophies.

I would like much to fill a double letter with my experience in rock-fishing, and perhaps my readers will blame me for not saying more; but I do not see that I have anything essential to add in the way of needed information, though I could weave a pleasant story to my own delight, if not to theirs.

After a week or more of pleasant sojourn in this delightful region, I took passage one day on the steamer that plies to Duluth, and after a voyage of seventy miles or so, found myself in the territory of Proctor Knott, and under the charge of Col. Hull, who keeps a popular hotel on the best town lot.

Of Wisconsin it may be remarked that its physical features and its fauna are much like those of the Aroostook in north-

ern Maine. It is filled with lakes, large and small, and is intersected by streams. Forests cover its length and breadth. Moose are found there, and nearly all the game and fish of Maine, excepting cariboo and salmon. The Wisconsin Central Railroad gives readiest access to it; but if one has time and loves the water, he can take steambot from Buffalo, Chicago, Milwaukee or Detroit, and traverse the entire chain of the great lakes.

HALLOCK.

**PERSONAL.**—Probably there is no sportsman better known in the United States than Colonel W. H. Holabird, who paid us a visit last week. Colonel Holabird is now en route for the South and Southwest, where he will pass the winter. He has kindly consented to take charge of Hallock's "Sportsman's Gazetteer" during his trip South, and will introduce the book among his numerous southern friends. During this gentleman's absence from Indiana, the extensive business in sportsman's clothing Colonel Holabird carries on will be conducted by Mr. J. S. Holabird.

**MAT MORGAN'S CARTOON IN THE SPIRIT OF THE SPIRIT OF THE TIMES.**—The *Spirit of the Times* sends us a charming cartoon, indicative of the coming year. It is St. Nicholas, the much beloved saint, who, muffled up in his furs, holds in his mittened hands the new advent—a pretty baby. From a halo around the child's head there blazes out 1878. A company of merry boys and girls welcome the new year. Mr. Matt Morgan, whose drawing is always as accurate as his feelings are poetical, has produced a capital picture, and the sentiment conveyed is a most happy one.

**A SPORTSMAN'S CHRISTMAS GIFT.**—For an angler nothing is more acceptable Christmas or New Year's present than one of Leonard's split bamboo fly rods. Mr. James H. Kilder, at No. 19 Beaver St., upstairs, New York City, has a few of these excellent rods, and invites an examination of their merits.

—For those who cannot afford a weekly sporting journal for \$4 per annum, the new monthly called *Field and River*, at \$1 per year, will undoubtedly give satisfaction. It is a modest but neatly printed periodical, and is published at New Brighton, Pa., by John S. Hoopes, steam and job printer.

**THE D. K. E. ANNIVERSARY.**—The thirty-third anniversary of the Delta Kappa Epsilon Fraternity was held last Thursday evening at Delmonico's, President Sydney Webster, of Yale, in the chair. After the dinner the following toasts were proposed: "Our Fraternity," responded to by Charles Hallock, of Amherst; "The Pulpit," by Rev. Dr. Ingersoll, of Williams; "The Bar," by Perry Belmont, of Harvard; "The Medical Profession," by Dr. S. F. Allen, of Amherst; "The Merchant," by Charles A. Wiley, Cornell; "The Press," by M. Ellis, of Amherst.

**AN ENGLISH TRIBUTE TO AMERICAN SCIENCE.**—Some time since we took occasion in these columns to call attention to the commendable attitude of our Government toward science and scientific investigation. We are pleased to see that this spirit has been recognized and appreciated abroad. At the anniversary meeting of the Royal Society at London, the other day, President Hooker, after a detailed examination of recent scientific investigations in America, said:

I must not close my notices of some of the labors of our scientific brethren in the United States without expressing my admiration of the spirit and manner in which that government and people have co-operated in making known the physical and biological features of their country. The results they have given to the world are, whether for magnitude or importance, greater of their kind than have been accomplished within the same time by any people or government in the older continents. How great would now be our knowledge of the climate and natural features of India had its trigonometrical or revenue surveys been carried out in the same catholic spirit, and what scientific literature can England and her colonies show to compare with that of the United States surveys?

## The Rifle.

### TEAM SHOOTING.

FOR THE "FOREST AND STREAM AND ROD AND GUN" MEDAL. Under the following conditions this journal proposes presenting to the best team, members to belong to some regularly organized association, a gold medal:

Shooting to take place January 23, 1878, at Union Hill Schutzen Park.

#### RULES AND REGULATIONS.

Each team to consist of twelve men; ten shots per man. Shooting, off-hand; distance, 200 yards, any rifle; open to all clubs or associations.

No person allowed to compete in a team unless he is an active member of the club for ninety days.

Practice from 10 A. M. to 1 P. M.

Team shooting to commence at 1 P. M. Targets to be drawn for by each captain of each team.

Entrance fee, \$6 for each team.

Ring targets to be used, three-quarter inch rings.

After deducting the expenses for the markers, the balance will be divided to the second and third highest teams.

Shooting to be governed by the Schutzen Bund rules.

All teams can enter for the competition at the FOREST AND STREAM AND ROD AND GUN office, 11 Fulton street, city, on or before January 20, 1878.

Captains of teams entered will constitute the committee.

**MASSACHUSETTS—Walnut Hill.**—Match number two, in the fall programme of the Massachusetts Rifle Association, was resumed on Saturday. This is a match open to all comers; distances 200 and 300 yards; rounds, seven at each distance; to be fired without cleaning from the beginning to the end of the score on both ranges; winners to be determined on the averages of three best consecutive scores. Prizes—first, a Peabody-Martini breech-loading Creedmoor rifle, value \$125; second, a life membership in Massachusetts Rifle Association, \$25; third, a silver medal, value \$15; fourth, cash \$10; fifth, cash \$5. The contest on Saturday was won by J. Wenmyss, Jr., by a score of 55, but, as he has not made the other two requisite highest scores, the match still remains undecided. The appended summary shows the score made by each competitor in Saturday's contest:

|                   | 200 yards.     | 300 yards.     | Total. |
|-------------------|----------------|----------------|--------|
| J. Wenmyss, Jr.   | 4 5 4 5 4 4 30 | 4 4 3 3 4 4 25 | 55     |
| H. Mortimer       | 4 4 4 5 4 4 29 | 4 3 4 4 4 4 26 | 55     |
| E. B. Southern    | 3 5 3 4 4 4 28 | 3 4 3 4 3 4 24 | 52     |
| J. S. Sumner      | 4 3 4 4 4 4 27 | 4 4 3 3 4 4 25 | 52     |
| H. Tyler          | 4 4 4 4 4 4 26 | 4 3 4 4 4 4 25 | 51     |
| C. H. De Richmond | 4 3 4 4 4 4 27 | 3 2 4 4 3 3 23 | 50     |
| J. N. Frye        | 4 4 3 3 3 3 24 | 3 2 3 4 3 2 20 | 44     |

After this contest a short-range match was shot, the distance being 200 yards. Rounds, 7; prize, the regular December badge, to be shot for twice, and won by the highest score on either day. There were nine entries, and the best score was made by H. Tyler. The next meeting will be on Saturday, the 23d inst. The following are the scores made:

|                   |                |
|-------------------|----------------|
| H. Tyler          | 4 5 4 4 5 5 31 |
| J. S. Sumner      | 4 5 4 4 5 5 31 |
| E. B. Southern    | 4 4 4 4 5 5 29 |
| H. Severance      | 4 5 5 4 4 4 28 |
| C. H. De Richmond | 4 3 4 4 4 4 28 |
| J. Wenmyss, Jr.   | 4 4 4 4 4 4 27 |
| William Poland    | 3 5 4 4 4 4 27 |
| H. Mortimer       | 3 4 3 4 4 4 26 |
| J. N. Frye        | 3 4 3 4 4 4 26 |

**NEW YORK—Syracuse.**—A team of five of the Amateur Rifle Association, of Syracuse, challenged and met a team of similar numbers of the Blydenburgh Club on the 14th, at the range of the club last named, for a friendly contest. Scores were made as follows:

|          | Amateur Rifle Association. | Blydenburgh Rifle Club. |
|----------|----------------------------|-------------------------|
| Lockwood | 4 3 4 5 3 4 41             | 4 3 4 5 4 4 41          |
| Jones    | 5 5 4 2 4 5 41             | 4 5 4 4 4 4 41          |
| Chapman  | 5 5 3 5 0 2 5 33           | 4 5 4 4 3 4 39          |
| Northrup | 3 4 3 4 5 5 0 4 38         | 4 4 4 4 4 4 37          |
| Chase    | 5 0 4 4 3 3 4 3 31         | 4 3 4 4 4 4 31          |

|          |                  |
|----------|------------------|
| Brown    | 3 3 4 5 0 4 4 35 |
| Brown    | 3 3 4 5 0 4 4 34 |
| Van Dyke | 3 3 4 5 0 4 4 34 |
| Wood     | 0 0 3 3 6 2 5 30 |
| White    | 2 0 0 3 2 3 5 26 |

**ZETTLER RIFLE CLUB.**—At the weekly shoot, Dec. 11, at 209 Bowery, 100 feet off-hand, at Creedmoor targets reduced, 10 shots per man, possible 50, the score was:

|                |    |               |    |
|----------------|----|---------------|----|
| M. B. Engel    | 49 | R. Donnell    | 45 |
| L. A. Beatase  | 47 | P. Dault      | 45 |
| B. Zettler     | 47 | D. Miller     | 44 |
| M. Farrow      | 47 | C. Judson     | 44 |
| C. G. Zettler  | 46 | M. L. Riggs   | 43 |
| G. A. Seburman | 46 | J. R. Grohman | 43 |
| P. Fenning     | 46 | M. Dorrier    | 43 |
| Wm. Klune      | 46 | F. Patterson  | 41 |
| R. Zimmerman   | 45 | J. Reyles     | 41 |

**CONLIN'S GALLERY.**—The fourth competition of the Marksman's Badges was held at Conlin's Gallery on Monday evening, Dec. 17, 1877, with the following results:

|                | 200 yds. | 300 yds. | Total. |
|----------------|----------|----------|--------|
| M. R. Engel    | 33       | 35       | 68     |
| W. McDougal    | 32       | 34       | 66     |
| J. Blydenburgh | 30       | 33       | 63     |
| P. Fenning     | 32       | 31       | 63     |
| M. L. Riggs    | 31       | 31       | 62     |
| S. W. Sibley   | 31       | 30       | 61     |
| A. Jackson     | 32       | 29       | 61     |
| N. O. Donnell  | 29       | 31       | 60     |
| N. O. Thurston | 30       | 30       | 60     |
| R. H. Hewitt   | 30       | 30       | 60     |

\* First badge. † Second badge. ‡ Third badge. § Fourth badge. The fifth competition will be held Dec. 24.

**THE AMATEUR RIFLE CLUB.**—The Executive Committee of the Amateur Rifle Club met Dec. 13 at No. 7 West Thirteenth street, the President, Lieut. Col. E. H. Sanford, in the chair. A committee of three was appointed to arrange for a room, with lockers, at Creedmoor, to be ready for the club by next spring. Mr. A. Alford, the treasurer, was directed to take measures for the collection of members' dues. A bill of \$183 for target hire was received from the National Rifle Association and ordered to be paid. Col. Sanford announced that he had received the badges won in the late long-range inter-State match by members of the club, and the trophy won by the team was directed to be placed in the window of a prominent jeweller. Mr. A. Alford offered a Remington Creedmoor rifle or shot-gun, worth in either case \$150, to be competed for next spring by the members of the club, provided they can procure range room to shoot at 1,200 yards distance.

**NEW JERSEY RIFLE ASSOCIATION.**—A meeting of the Board of Directors of the New Jersey State Rifle Association was held at Parlor No. 10, Astor House, on Friday last, Col. Edward H. Wright, the President, in the chair. The preliminary meeting of the association was held during the previous week, at which the following officers were elected: President, Col. Edward H. Wright; Vice-president, William H. de Hart; Secretary, George Squires; Treasurer, H. F. Anderson. Board of Directors—General McIntosh, B. A. Vail, A. R. Warner, J. T. B. Collins, O. A. S. Man, Dudley S. Steele. Major Henry Fulton, Peter Bonnett, Dr. J. M. Dart, George Carter, Capt. Geo. R. Winn and the officers. Major Fulton, of the Committee on By-Laws, submitted a copy of the by-laws governing the National Rifle Association as covering all the necessary rules. The by-laws were adopted, section by section, with some slight alterations. The most important change was in the concluding section, which gives the members of the National Rifle Association the power to vote for amendments to the by-laws. This was altered on motion of Gen. McIntosh, so as to reserve that power to the Board of Directors. On motion of Major Fulton, a committee of three was appointed to secure a permanent place of meeting for the Board of Directors. The chairman selected Messrs. Fulton, Anderson and De Hart. A discussion ensued in reference to procuring a suitable piece of land for laying out a rifle-range. It was announced that a meeting of the association would be held at Elizabeth, N. J., on Monday evening.

**NEW ORLEANS RIFLE CLUB.**—Probably on account of the fine hunting weather, the assemblage of members of this club was not so large as could be expected at their meeting, Dec.

9. Among a number of good scores made at the different ranges, was that at 500 yards, off-hand, standing, by Capt. Kressner....2 5 0 4 5 4 3 5 5 5 5 5 3 5 3—64 and at 1,000 yards by

Robert Eyrich....4 5 5 5 5 5 5 5 4 5 5 4 5 5 5—72 The members of this organization are seriously contemplating the raising of a team for competition in next year's inter-State rifle match, and with the excellent material at hand anticipate a favorable result. Of military organizations the Mitchell Rifles contested at this club for the Goodwin badge.

200 yards, off-hand.  
John P. Roche.....3 3 3 3 4 3 5 5 4 2 4—34  
Capt. M. Cooney.....4 3 3 3 0 4 3 3 3 0—26  
Capt. J. Cooney.....0 4 3 3 3 0 4 3 3 5 0—26  
M. O'Connor.....2 4 4 4 8 0 2 0 4 3—26

Good scores were likewise made by Mr. Garry, of the Irish Rifles, and Mr. Robinson, of Fort St. Philip.

**THE NEW SHARPS' HAMMERLESS RIFLE.**—The following very fine scores were made Nov. 11th, with the new hammerless rifle, manufactured by the Sharps' Rifle Manufacturing Co. Distance 950 yards. Two sighting shots were taken with the first rifle fired, and elevation etc., having been determined, five rifles were used. The following were the scores out of a possible 75:

|             |                                  |
|-------------|----------------------------------|
| Rifle No. 1 | 4 5 5 4 4 5 5 5 4 5 5 5 5 4 5—70 |
| " 2         | 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5—71 |
| " 3         | 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5—71 |
| " 4         | 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5—71 |
| " 5         | 5 5 5 5 5 5 5 5 5 5 5 5 5 5 5—71 |

Total.....360

**A NEW NATIONAL RIFLE ASSOCIATION.**—A scheme is now in process of ventilation to establish a new ("National") National Rifle Association. The proposition is made, as to officers, that vice-presidents be selected from all the States, and that a general of the army be placed at the head of the association as president.

**ABOUT THE CHAMPIONSHIP.**—To judge from the articles in the American papers the feeling among the riflemen of the United States is opposed to the organization of any "International" small-bore contest, except that for the Centennial trophy, which, by the way, it is proposed to shoot for next year in Paris, as a convenient neutral ground, particularly the occasion of the Great Exhibition. As we have often said, we think it not very likely that any English team will shoot for the trophy in question against Irish or Scotch antagonists, who are clearly admissible in future; and certainly no United Kingdom team can take part in the contest except as the sole representative of this country. But we cannot quite understand the objection on the part of the Americans to shooting a match at Wimbledon against a team of the United Kingdom. So far as we can judge, the objection seems to depend mainly on the exaggerated importance of the term, the "Championship of the World." The match-rifle "world" is as yet very small, and we regret that such a high-flown term as championship has been invented at all. Certainly, if an American team does come to Wimbledon, and a mixed team of our countrymen does manage to beat it, which seems at present not very likely, we should have no cause to call ourselves the "Champions of the World," except in so far as that we should be the "champions" of the year of the particular cup or prize, if any, which might be connected with the match.

**Volunteer Service Gazette.**  
All we have to say about the above is this: Aside from the natural spread-eagleism, so inborn in our free and enlightened people, the term "Championship of the World," though decidedly high-flown, spells exactly what it means. So far we have secured the title, and whether we are Champions or the Best Snorts must remain, with all its high-falutism, until some other team better than our own beats us.

—Our American cousins, and some Englishmen to boot, seem to think that those among us who decline to admit that the result of the Centennial match ought to lead us without further consideration to disqualify the muzzle-loading match rifle, at once and altogether, are very pig-headed. It appears to us, as we said last week, that the matter may well be left to the competitors in "any rifle" contests, who will certainly get the best rifle they can. If it is found that the power of being perfectly cleansed after every shot, undoubtedly possessed by the breech-loader, (time being of no more importance than it is with the muzzle-loader), leads to higher scores, then, assuredly, the breech-loader, with its very delicate cartridge, will soon supersede its rival in this country, as it has already done in America. —*Volunteer Service Gazette.*

We think our most careful contemporary, to whose columns we are indebted for so much interesting matter, is right here. Now, we honestly believe that the competitions for "any rifle" will bring out better shooting in England with improved breech-loaders, and that sooner or later the merits of the two systems will be determined. But the trials must be with improved breech-loaders. Whether they be English or American arms we do not care. Nothing would be more asinine than for us to say that the wonderful workmen of England could not produce breech-loading arms as accurate as our own, but we are inclined to insist that they have not done so yet.

—An correspondent writes us in regard to the tone of the English press about our rifle-shooting:

It is pleasing to see how our English friends have dropped their patronizing tone and begin to look up to us as instructors in the art of rifle shooting.

**FOREST AND STREAM.**—An authority upon any given subject is a "good thing to have in the house." We refer with pleasure to a sprightly weekly journal, the FOREST AND STREAM. It is replete with most interesting and instructive matter relating to our glorious forests, streams and lakes, and all that is contained therein. Its pages will serve to pass the time of the father, mother, son and daughter, educating each member of the family circle. The last number is particularly interesting. —*Phila. North American, Nov. 31st.*

—For the month of November the mean midday temperature at New Smyrna, Fla., was 71°. There was frost on the 30th.

## BOAT AND YACHT BUILDING.

BY NAUTICUS.

### THE BUILDING OF THE BOAT.

The construction drawings are copied or laid off on a floor to the full size of the proposed boat. Larger and longer battens are used, and the lines triced up as described in the article on the construction drawings. The mode of working is the same for all full modelled vessels, from a row-boat to a ship, the only difference being that due to size. After the floor drawings are completed, a mould-board is cut for each pair of ribs and nailed to the floor. The manner of cutting the mould-board is explained in diagram No. 24. The outside curved line represents the outside of the cross section on the body plan; the space from A to B represents the thickness of the planking, and the space from B to C represents the thickness of the rib. The mould-board is cut enough smaller than the cross section outline on the body plan to allow for the thickness of the rib and planking. The mould-board is indicated on the diagram by the curved line C and the dotted line. Ribs for a boat sixteen or seventeen feet long and four feet wide may be placed a foot apart. The lengths of the ribs are found from the body plan. Saw them out of white oak, one-half or five-eighths of an inch thick, and let them be three-fourths of an inch wide, with square edges. The ribs for one side of the boat are steamed in the steam-box and bent closely to the moulds, fastening them by blocks and nails, and after remaining on the moulds a day or so, are removed, a stay-lath being nailed across the curve to prevent them from springing, as shown on diagram No. 25. The ribs for the other side of the boat are now bent on the mould and undergo similar treatment. The ribs are now bevelled on both edges; the bevels are greatest at the gunwale end of ribs and diminish to nothing at the keel. The intersections of the different water lines with the cross sections on the half breadth plan, show the bevels required for each pair of ribs. The bevels of each rib of a pair are the same in angle, but are opposed to one another, forming "rights and lefts." Diagram No. 26 will make the matter plain. After beveling, the stay-laths are again fastened across the curve of the ribs, and the length of the ribs marked by laying them on the body plan and marking the endings on gunwale and keel. Each pair of ribs is connected at the bottom by an angle piece called a "bottom," fastened to the lower ends of the ribs by two small nails in each rib.

The angles to cut the bottoms are found from the body plan. Diagram No. 6, in the paper on the ship-jack model, shows the bottom and its connection with the ribs and keel. The mode of forming the stem-keel and stern deadwood are also described in the same paper, diagrams Nos. 7, 8, 9, 10 and 11. The bevels for the stem, and for the grooves in the same, are found from the half breadth plan, the intersections of the water lines, with the half thickness of the stem squared down, giving the bevels for one side, the bevels

for the other side being the reverse of those taken from the drawing. The manner of cutting the grooves in the stern deadwood, also the bevelings of the keel and mode of joining the several parts, are all clearly explained in the paper on the ship-jack model. The frames that fasten on the stern deadwood are joined as represented in diagram No. 27. Set up the stem, stern and keel on a stocks, as before described, adjust the stem and stern until they stand vertical by a plumb line, and stay-lath securely in place; also fasten the stocks securely to the floor. Connect the top ends of each pair of ribs—technically called a frame—by a stay-lath, placing the ribs the proper distance apart at the upper ends. The measurements are obtained from the half breadth plan, and are twice the width of the sections on the gunwale, minus the double thickness of the planking; the frames are stay-lathed this distance apart, measuring from outside to outside. Make a mark in the centre of the stay-lath to correspond with the base line of the half breadth plan, and as a guide in squaring up the frame. All the frames are prepared in like manner and fastened to their places on the keel by a small bolt or rivet through the bottom and keel. The frames are stay-lathed in such a manner that a line drawn from the centre of the stem to the centre of the stern post will be vertically over the centre of all the different frames. If there is a beam over head, stay-lath the frames to it, or to the ceiling of the work-shop. If no such conveniences are at hand, a stiff plank can be fastened between the stem and stern-post, above the keel, to which the frames can be fastened. The dimensions of the principal timbers for a sixteen-foot boat may be as follows: Keel, one and one-quarter or one and one-half inch thick, by two inches or more deep; stern deadwood, of the width and shape shown on the sheer plan, and as thick as the keel along the groove line, its outer edge at the stern planed down thinner. The stem varies so much in its different parts that no particular size can be given. It should be about four-eighths of an inch thick at its forward edge on top, and less at the bottom. The planking laps on it at least one and one-half inch, and from groove at top of stem to forward edge of stern should be one and one-half or two inches.

Measurements from the floor drawings will give exact dimensions for every part. Stern-

board, three-fourths of an inch thick. The wood for all parts of the frame should be white oak, and all sap wood rejected. Nails and rivets are best of copper; galvanized iron will answer—but for a small boat the difference in price is not a great matter. Boards for planking—cedar, one-half inch thick, and long enough to reach from end to end without joints. White pine makes a very good planking, and, when cheapness is an object, may be used. In selecting cedar for planking, be careful to get stuff as free from knots as possible. Diagram No. 28 shows the manner in which the planking is cut

and bent to the frames. In this diagram the planks are all shown as of an equal width. It is customary to make the planks next to the garboard strake—called broad strakes—wider than the others; but it will be easier for the tyro to make them all of about the same width, as shown on the diagram.

To mark the planking on the body plan or on the ribs, divide the distance along each rib into a number of equal parts, corresponding to the number of planks it is proposed to place on each side. As the length of the ribs are different, the planks will be widest at the middle of the of the boat and narrow toward each end. The planks are also more or less curved. The first planks to fasten in place are the upper strakes along the gunwale. To determine their shape, procure a batten as long as the boat, six to eight inches wide and one-fourth of an inch thick. Place the batten on the upper edge of the ribs, and clamp it from one end of the boat to the other. The batten is now in position to have the markings on the upper ends of the ribs, denoting the gunwale of the boat, and the markings which determine the width of the upper strake, transferred to it. Unclamp the batten and lay it on the board selected for an upper strake; prick through the marks on the batten with a brad-awl; remove the batten and the marks will be found transferred to the plank; connect the different points by a suitable batten and the upper strake will be shaped in outline ready for cutting to shape. After the first upper strake is completed, it is used as a pattern to cut the strake for the other side of the boat. The ends of the upper strakes are now cut to fit the groove in the stem and nailed to their places on the boat. The gunwale is now formed by sawing off the projecting ends of the ribs to an angle of about forty-five degrees, and fitting and securing the rails in place, as directed in the paper on the ship-jack model. Dimensions of rails, one or one and one-quarter inch by three-fourths of an inch. The ends of the rails at the stem are tapered down to one-half or five-eighths of an inch wide. Diagram No. 29 shows the connections of the rail with the stem, and diagram No. 30 the connection of the rails with the stern. The stay-laths are now removed from the boat, the frame detached from the stocks and inverted on benches, and the planking put on in the following manner: First, the planks next to the upper strakes; secondly, the planks next to the keel, technically called the garboard strakes; then the planks next to the garboard strakes, called the broad strakes; and lastly, the strake along the bilge—or greatest curvature in the ribs—called the shutter strake. Suggestions as to ceiling, seats or thwarts, row-locks, etc., have been given in previous articles. The boat drawings in this article are for a boat with a different midship section than the one already published, and are for a boat sixteen feet long and four feet wide. It can be made larger or smaller as the builder may require, but for general use the size given will be found the most useful. The model here given will carry more load, and will make a much stiffer boat than the model given with the paper on drawing. Either will make a good and easy rowing boat. A sail may be used of sixty to seventy square feet area.

## Rational Pastimes.

**FOX HUNTING.**—The Queen's County hunt met Saturday at New Cassel Wood. The large attendance, including all the familiar faces, spoke well for the undiminished interest in the sport. The run, first to the northeast and then to the eastward, was thence at a rattling pace across the plain toward the kennel at East Meadow. Then the farming lands with stiff posts and rails tailed the field out considerably, leaving the less courageous in the rear. When, however, the pack started for the cedars in the direction of

Merrick the field was well together again, with twenty or thirty in full view of the hounds through the cover, thence into the open space of the Hempstead plains, and away over the farms and fences they flew, when reynard, turning to the northeast, made straight for Hicksville. Then wheeling, the run was over the plain toward the Island of Trees; and in the open two miles to the west of Farmingham the fox was killed. One of the ladies was among the first, and the pads were awarded to strangers. The run of about seven miles and one-half was gone over in less than fifty minutes.

**THE MONTCLAIR EQUESTRIAN CLUB**, in which are enrolled forty-six members, had a very successful run last Saturday, although as the harriers had not yet arrived from England, it was necessarily a drag hunt. The laurel wreath, which for the nonce took the place of the brush, was awarded to Miss N. Thompson.

**NEW YORK ATHLETIC CLUB.**—The First Annual Winter Meeting, open to amateurs, will be held on the evening of Friday and Saturday, January 4th and 5th, 1878, at Gilmore's Garden (formerly Barnum's Hippodrome). The programme will be as follows, unless circumstances demand a change:

First evening.—1. Sparring, light weight, 135 lbs. and under. 2. Sparring, heavy weight, 155 lbs. and over. 3. 75 yards run, handicap, 1st trials. 4. Mile walk open to those who have never beaten 8:30. 5. Tug of war (10 men on each team), trials. 6. One mile run, handicap, 7 trials. 7. One lap hurdle race, handicap, trials, 10 bush hurdles, 3 feet. 8. 75 yards run, handicap, 2d trials. 9. One mile walk (special). 10. 440 yards run, handicap, trials. 11. One lap hurdle race, final. 12. Tug of war, final.

Second evening.—1. Sparring, middle weight, over 135 lbs. and under 155 lbs. 2. Fencing. 3. 75 yards run, handicap, final. 4. Two mile walk, handicap. 5. 75 yards hurdle race, handicap, trials; 7 bush hurdles, 3 feet. 6. 440 yards run, handicap, final. 7. International tug of war (professionals), trials. 8. 75 yards hurdle race, final. 9. One-half mile run, handicap, 10 trials. 10. One mile walk (special). 11. International tug of war, final.

No communication will receive attention unless addressed to the Club Box; and all persons are particularly requested not to call upon the officers of the Club at their places of business.

For all particulars address Alfred H. Curtis, Secretary, P. O. Box 3101, New York.

**ATHLETIC CLUB OFFICERS.**—The American Athletic Club, of this city, which has hitherto had only a temporary organization, has effected a permanent one by electing the following officers: President, John Gal. Vice-President, H. Lott. Secretary, S. W. Hoag, Jr.; Treasurer, Frank C. Lowry; Board of Management, C. Van Tambocht, W. O. Benms, E. W. Burnett, M. D.

**FOOT BALL.**—The Brooklyn Polytechnic Institute and the New York College teams. The game which was sufficiently interesting developed no very friendly spirit between the players. The Polytechnic team secured one touch down. The teams were:

Polytechnic.—Hough, Ely, Laidlaw, Atkinson, Black, Field, Osborne, Murray, Jenkins, Ladd, W. Field.

New York College.—S. Ormsby, C. Ormsby, E. Bunzl, Frabigo, Fridenberg, Rayner, Biddian, Ryer, O. Bunzl, Wagster, Langbein.

**ON THE GODBOUT RIVER.**—We copy from the London *Field* the following very graphic account of salmon fishing on one of the very best rivers in Canada. We do not have to send to London for all such clever descriptions of American sport by any means, for our own Dawson, Wilkinson, Warren, Venning, Ward, and a dozen others have already embellished the columns of *FOREST AND STREAM* with brochures equally piquant and truthful. Nevertheless, we care not to omit helping ourselves from foreign store when such rare opportunities offer as this. The information given has of itself an intrinsic value which our own anglers may profit by, if they choose:

"Prostrated by the heat as the long summer days drag on, what so powerful a pick-me-up as a week amongst the salmon? The morning was lovely when the tight, little yacht *Cruiser*, eighty tons register, with a party of fishermen on board, left Quebec for the Godbout, drawing but five feet of water, as she steamed from the wharf and tumbled about the St. Lawrence (agitated by the meeting of the tide and stream), doubts, soon to be discarded, arose as to her behavior when she should encounter the big waves of the Gulf, several hundred miles below.

With fair wind and tide, doing her thirteen knots an hour quietly as a sail boat, past the Island of Orleans, the garden of Quebec, skirting the bold north shore (the home of moose, caribou and bear), Grosse Isle, of quarantine fame, Crane Island (where sportsmen, from early morning until sundown, hunt wild fowl with varied success); past timber-laden ships bound seaward, and vessels working up against wind and tide, our little craft, her first day's work accomplished, crept safely as night drew on, along the wharf at Riviere du Loup.

A stiff north-wester blew next day, and as we howled along in the trough of the sea, broadside to the waves, our commodore's admiring exclamation of yesterday, "She can't capsize," was changed to resigned assurance that she'd certainly go over; but she didn't

and evening saw her safely anchored inside Biquette Island.

At 2:30 A. M., aroused by the starting of the engine and noise of the anchor-chains I peeped from the cabin window. A dubious light on the far-off sea, a bright and fast increasing radiance, a blaze of fiery water from the horizon to the yacht, proclaimed that the sun was up. One hundred miles across, in a north-easterly direction, lay the Godbout. Porpoises rolled sleepily around, and seals here and there popped their round heads above the surface and disappeared as we passed; and as the steamer approached the shore, innumerable wild ducks rose like an exhalation from the sea, circling us in clouds, and even shading us from the sun. We anchored at the mouth of the river, and the parting whistle of the yacht reverberated among the hills, scaring the lonely group of Indians gathered on the beach, as we paddled up to the camp a mile and a half beyond. The Godbout supplies first-rate sport for three rods. Two miles of water cover all the pools in which salmon are killed, and these, divided into three portions, one for each rod, are taken in turn by the fishermen. Each division has its own peculiar charm, and each differs entirely from the others. The natural divisions are the Camp Pools, the Centre Pools and the Upper Pool.

Fishing in the Camp Pools, partly from the shore, partly from a boat, with plenty of room to play the fish, a good beach to land him, and every facility for following him, would, by many devotees of the rod, be considered perfection. Here little danger exists of losing a well-hooked fish, and although, fresh from the sea and vigorous, he may spin off your line to within a few yards of the end, reeling up or giving out as your gaffer sends the boat after him, you may, with undisturbed equanimity, smoke the fresh-lit pipe, sure of your quarry.

Not so certain are the pools immediately above, although easy to fish as compared with those higher up. Their waters are divided by a small wooded island, below which, forming for a few hundred yards powerful rapids, they unite in the quiet of the Camp Pools.

Leaving these, a short struggle with paddle and pole brings your boat to the head of the Belle Rapid, where it is left handy for shoving off. A little way above, you may hook a salmon in the Belle, and if you can lead him up stream, he is probably yours, but his course is oftener down. With a heavy strain upon your rod you try to hold him back, and yet are forced forward so fast against your will, that to keep your feet, save your tackle, and scramble panting into the boat is no easy task, and you are in for a rare bit of sport. The gaffer shoves into the rapid, sweeps past boulders and ugly eddies, by magic saving an upset, and, as the sudden slackening of the line tells that the fish has halted, brings up in the middle with a jerk sadly dangerous to your equilibrium. The water boils and hisses round you, and as you totter for an instant, and steady yourself, another rush for very life is made, the boat yields to the current, and sweeps into the quiet pool below, where, the tumult over, you can settle at your leisure with your fish. So much for the Belle and her neighbors.

Half a mile above, the river, which along its entire course is picturesque, becomes rougher and wilder. The banks, closely wooded, rise abruptly, on either side, extending into hills of considerable height, and the pools are reached by a well-trodden path singularly wild and beautiful. At the Shea Pool huge boulders in numbers are scattered over the bed of the river, which boils and tumbles through them. To gain the points where the salmon lie, rough ladders are laid from rock to rock, and here all your skill is wanted. Where the deep and rapid water gliding past the opposite cliff brightens over a boulder below the surface, your fly dropped deftly just above will do its errand. A long cast, but a certain one—to hook at least; but the current is heavy, and a few yards below the rapids are impassable. The chances are in favor of the fish. Look out—he's hooked. Whirr! the reel replies to his salute; whirr! he's going down; whirr! for heaven's sake, hold!—whirr! the strain is off, the line is limp and loose, the fly and half the cast are gone! Several other pools of varied difficulty and beauty comprise the second division, all requiring for a good bag skilful fishing.

The fishing has up to this point been from the east bank of the river. We cross at the Indian, which is fished from a boat lowered inch by inch down the deep current, dark from the shadow of the wooded heights beyond, and our path, straight through the forest to the Upper Pool, cuts off a picturesque angle of the river in which are the Charteris and Eagle pools. The Upper Pool is the finest and largest in the Godbout. In it the best day's salmon fishing ever recorded was made, when Mr. Allan Gilmour some years ago killed forty-six—a score which has since been surpassed by the guardian of the river. During the best part of the season an ordinary daily yield of that pool to an experienced fisherman is from ten to twenty salmon.

Standing about the middle of a gravelly beach, a short way above and behind to your left is a point of massive boulders, round which the water, after rushing tumultuously through a wild and narrow gorge, extends into a basin of comparative quiet and considerable width. Shallow where you stand

as it ripples over the pebbles, it gradually deepens and darkens as it sweeps round the base of the opposite cliffs.

With a short line, from the shallows by your feet you will hook the first fish, and ere the fly, gliding with the stream or dancing among the ripples in gradually extended curves, has reached the full measure of your strength, you will seek a respite as each successive fish is landed, to admire his beauty and smoke with mingled pride and pity a pipe of peace.

Many may be guided, after a few frantic rushes and a wild jump or two, to the eddy above, and readily gaffed; but now and then a fish comes on whose purpose is to fight. With a shoot across, the silk line threatening to cut your fingers like a knife, your rod bending like a withe, and your reel working like a steam engine, for an instant he staggers you; he flashes in the air in defiance, and proclaiming himself a twenty-pounder, drives the barb well in, and, goaded to fury, goes off with a lash of his tail. Give him the butt now strong. The river runs swifter and swifter, and tossed and broken by gigantic rocks two hundred yards below, which you cannot pass. Down, down he goes, and you feel as you tear along that you must soon give up. But he stops among the rocks. What bliss! you rest against a boulder and have him still! Inch by inch you reel in, as, slowly moving round, he nears you. Now your casting-line appears, and now a black tail, cropping up above the surface, slowly moves from side to side. The gaffer feels his gaff and creeps beneath a rock; another yard or two—the gaff is over him. Watch! strike! miss! Whirr—the line spins off; he takes the chute—click; another fly is lost! A black spot for an instant marks him in the torrent far beyond your reach.

Fish after fish is added to your score, each attended by its particular incidents; and each evening, ere returning to the camp, you have had no ordinary strain on both mind and muscle.

After a good day's catch there is no prettier sight than the product of each rod ranged upon the grass. Each fish having been first weighed and registered, those for immediate use are set aside, and the rest are carefully prepared and put in barrels.

For about a month the salmon, fresh from the sea, and in fine condition, take the fly pretty freely. After that time they have for the most part run far up the river to their spawning pools. This is a signal for us to leave, and, with a total of 400 fish, of an average of 13 pound, killed from June 15 to July 15, we paddle down to the Cruiser, and steam away from the Godbout for another year." F.

—In a paper contributed to the *Nature*, Sir Joseph Dalton Hooker sketches the comparison which he instituted between the floras of the Rocky Mountains and those of other parts of this continent, as the result of his observations with Dr. Asa Gray in the survey of Colorado and Utah. The region traversed, both on account of its geographical position and topographical characteristics, contained two temperate and two cold or mountain floras; first, a prairie flora, derived from the eastward; second, a so-called desert or saline flora, derived from the west; third, a sub-alpine; and fourth, an alpine flora. He says that the principal regions with which the comparison must first deal are four. Two are mainly humid—first, that of the Atlantic coast west to the Mississippi, with the forest-clad shores of the Western tributaries of that river; second, that of the Pacific slope from the Sierra Nevada to the ocean. Two are inland, namely, that of the northern part of the continent to the Arctic circle, and that of the southern part extending through New Mexico to the Cordillera of Mexico proper. Dr. Gray has treated largely on the contrasts of the two humid divisions; but Sir Joseph hopes that he has now materials for discussing the relations of the dry intermediate regions to these or to the floras of other countries. He concludes that the vegetation of the middle latitudes of the continent resolves itself into three principal meridional floras incomparably more diverse than those of any similar meridians in the Old World, being, in fact, as far as the trees, shrubs, and many genera of herbaceous plants are concerned, absolutely distinct.

THE RECLAMATION OF ALGERIA.—The railway companies of Algeria had, up to June 1, 1870, according to the *Courier d'Oran*, planted on the way from Algiers to Oran, 14,400 fruit trees, 98,900 forest trees, and 344,000 trees of different species, on the open plains and slopes, making in round numbers 457,000 trees. Since then the number has been sextupled; the company estimating the number actually planted by it on the line, as 4,000,000. If to these particular plantations we add those which have been made in the three provinces by the proprietors, large and small, such as of the eucalyptus, the acacia, willow, casuarinas, poplars, etc., we are compelled to believe that in fifteen or twenty years, Algeria will be almost entirely re-deemed.—*La Nature*.

MESSRS. TIFFANY & CO.,  
UNION SQUARE, NEW YORK  
City, have made extensive preparations for the approaching  
HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

Sportsmen's Goods.

## FLORIDA OUTFITS.

Send 10 cents for illustrated catalogue of SHOOTING, FISHING and CAMPING GOODS, with hints and directions for camping, shooting and fishing. Bogardus' rules for glass ball shooting, etc., etc.

TENTS, CAMP STOVES, PORTABLE BOATS, RUBBER GOODS, JACK LAMPS, ETC.

Suits of all kinds, including velvet, corduroy, leather, etc. Also a new style of duck, very soft and pliable.

Fox, Webley, Scott and other breech-loading guns and rifles. Ammunition of all kinds.

SPLIT BAMBOO RODS.

I am able to offer to sportsmen a very superior article in split bamboo rods for fly and bass fishing and trolling. Call and examine them. Every rod warranted. With skeleton reel-bands, \$18; solid reel-bands, \$23, with tip case, extra tip and bag.

These rods have been well tested, and are equal, if not superior, to any in the market.

FLORIDA OUTFITS A SPECIALTY.

A supplement to my illustrated catalogue will be ready this week, containing a number of new articles for sportsmen, including price list of

SKATES.

No sportsman should be without "THE SPORTSMAN'S DIARY AND NOTE-BOOK." Blank Scores for all kinds of shooting. Rules, etc., bound in leather—a handy size for the pocket. Sent on receipt of 50 cents.

Send no money by mail; remit by draft or P. O. order.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$35; Vest, \$6.00. Also the best brown corduroy pants at \$10 per pair. Make only the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Yet. Coat, \$6.00. For full suit, \$14.00. I also make the sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

L I E

## New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD

For off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unexcelled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

CARL DITTMAR, NEPONSET, MASS.

# ORIENTAL POWDER MILLS

MANUFACTURERS OF ALL KINDS OF  
GUNPOWDER

Office—13 BROAD STREET, BOSTON.

**BRANDS**—DIAMOND GRAIN.  
FALCON DUCKING.  
WILD FOWL SHOOTING.  
WESTERN SPORTING.  
(Oriental Rifle.)

The "Oriental" powder is equal to any made; no expense is spared to make the best.

# THE HAZARD POWDER CO.,

MANUFACTURERS OF  
GUNPOWDER,

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shotguns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it takes any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 5 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER.  
ALSO, SPECIAL GRADES FOR EXPORT OF  
ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

W. SIMMONS &amp; SON,

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest, and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

## OUR PATENT DECOYS

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen: geese, \$3 each; yellow leg, \$4.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; goen plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.00 per dozen. We are now making standing geese for field shooting.

## THE HUNTER'S TENT

is made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

The judges' report at Philadelphia they were commended for excellence in every part. Very novel and; racticable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quick folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

SIR—I have just returned from a three-weeks' camping expedition in the Adirondacks, and have had the three tents bought of you put to the severest tests of exposure both as to wind and storm, and I do most unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.

2d. They are perfectly waterproof.

3d. They are a good height, and all the room I available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both indorse what I say about your tent. With kind regards, yours truly,

F. B. SAVAGE.

## Tan-Colored Leather Pliable Waterproof Suits.

In Shooting Coats, Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches, \$15; Jackets, \$18; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of kid. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and after drying was happily surprised to find it had not stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with flannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

For every kind of sportsmen's goods address

G. W. SIMMONS & SON,  
Oak Hall, Boston, Mass.

## FURS.

# Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The Cone is made of nickel, and fastened solid in its place. Nothing rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents misfire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDAUS, CHAMPION WING-SHOT OF AMERICA.  
Messrs. GEORGE B. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.

Yours truly,  
A. L. BOGARDAUS.

ESTABLISHED IN 1837.

Consult your interest by sending for our revised and reduced prices.

Scroll Saw

**Excelsior**  
LATEST IMPROVEMENT.  
Double Treadle, including one doz. Saws, thirty suitable for Sawing Patterns and prepared Wood, to the value of \$4. A new device for cutting Saw, Power Drilling attachment, Wrench, Oil Cup and Screw Driver. Speed, 800 strokes per minute. Saws, 1 1/2-inch thick. Price, complete, case and delivered on board cars or at Express office, \$12.  
Saw only, without attachments, \$5.

**SMALL STEAM ENGINES.**  
With Copper Boiler, to drive light Lathes, Scroll Saws, etc. All sizes from 1-8 up to 2 horse power; either plain castings, partly finished, or complete, ready for use.

The "Scientific American" of June 19, 1877, says of the above, in an extended Editorial, introducing our manufactures to the public: "It can turn wringers, churns, washing machines, ice cream freezers, run coffee mills, pump water through a house, actuate foot lathes, scroll saws or light boxing machinery, run knitting or sewing machines, turn a grindstone or emery wheel, work ventilating or hand twisting machine cutters, meat or feed choppers, or sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a blacksmith's forge, or compress air or work an air pump on a small scale in a laboratory. These are a few only of the purposes to which it can be applied."

Also Engines and Boilers capable of propelling boats. The boats have keel, stem, with rudder and tiller, row locks and oars; These willing a pleasure boat will find

ling boats from 18 to 22 feet long, 4 1/2 to 5 1/2 feet beam, with draft of water stem and rudder post of oak, pine planking, copper fastened throughout, fitted seats all around the boat, lockers and coal bunkers, and have two coats of paint. These the safest and fastest, as they can be made to attain a speed of from 6 to 16 miles per hour. They are adapted to great variety of uses, such as Excursion, Shooting, Fishing, or Pic-Nic Parties, for travelers, voyagers, Pleasureists and coasters, and especially owing to their light draft of

water for exploring expeditions and surveying parties. The Engine and Boiler can be easily detached from the boat, and is then available for Agricultural, Mechanical, Commercial or Domestic requirements or for the use of Amateurs, when power is needed for running light machinery.

Price of 20 foot boat, complete, \$425.00  
Price of Engine and Boiler, without boat, including driving pulley, 275.00

Illustrated Catalogue containing One Hundred Scroll Work Designs mailed to any address free on receipt of Stamp.

GEORGE FARR, BUFFALO, N. Y., U. S. A.

# A VICTORIOUS INVENTION The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation.

It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape. It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

## PRICE LIST.

No. 1—For fishing and all kinds of small game and animals, sent by mail, 25 cents.  
No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, etc., 75 cents.  
No. 3—For Rocky Mountain Giant, for catching Bears, Wolves, Panthers, etc. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight, 10 to 15 lbs. \$40.

## Guns, Rifles, Etc.

# THE CHOKE-BORE MATCH.

W. W. GREENER begs to inform his numerous patrons in America that his gun has again come off victorious at the great match of Choke-Bore vs. Cylinder Bore, at the London Gun Club, on May 23, beating seventeen of the best shots in Great Britain who used guns by the best London makers, viz.: Four made by Grint, three by Purdy, three by Douglas, one by Lancaster, Boss and others.

[See London Field, May 25, Editorial Remarks.] "Mr. Cholmondeley Pennell, the winner of Mr. Purdy's massive fifty guinea cup, weighing over 91 lbs., for the highest score, shot wonderfully well, killing all his birds at 30 yards with the first barrel. The gun he used was a full choke, by Greener, of Birmingham. The result of the trial served to show the superiority of the choke at the long range. Mr. C. Pennell cutting down his birds in a marvelous way with his heavy Greener."

W. W. GREENER,

St. Mary's Works, Birmingham, and  
68 Haymarket, London.

Read "Choke-Bore Guns and How to Load," by Cassell, Petter & Galpin, New York.

## W. W. Greener's CHOKE-BORE GUNS, Tried on Game in America.

Supplied by H. C. Squires, 1 Cortlandt St. NEW YORK.

See the Following Testimonials:

Six—I a pleasure for me to inform you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in fowling-pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern and greatly increases penetration. To prove this, I will give you the performances of this gun. The 32-inch 10-gauge barrels, charged with 4½ drachms of powder and 1¼ oz. No. 6 English chilled shot, give patterns ranging from 325 to 350 pellets in 32-inch circle at 40 yards. The same charge of powder and 1¼ oz. No. 4 American shot gives 160 to 175 pattern, with penetration which kills ducks at 50 to 75 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 28-gauge 25-inch modified choke-bore barrels, with 3½ drachms of powder and 1¼ oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally find ruffed grouse, woodcock and quail, these birds being killed with few exceptions, at from 15 to 25 yards.

COL. JOHN BODINE.

DEAR SIR—The guns arrived all right. We think these last guns you have sent us will place the Greener guns ahead of any other in this country, as guns of other makers don't compare in shooting qualities with them. We unhesitatingly recommend the Greener as far superior to any gun of foreign or domestic manufacture that we have seen. We say this after seeing and using guns of all the most celebrated makers.

CARLISLE, JONES & CO.

SEMA, Ala.  
The Greener gun presented by Mr. Squires for the best pointer, and awarded to me, is a close, clean, hard hitter, killing its game at very long distances. It is the second Greener that I have owned and they cannot be beaten. I am a win with them in the trap in the field.

S. B. DILLBY.  
LAKE CITY, Minn.

Sir—I have a pair of W. W. Greener's breech-loaders (bought of H. C. Squires, of New York), modified choke-bore. I have had an opportunity to test these weapons on birds heavily feathered, and where great penetration was essential to success. I have repeatedly made long shots, always killing the game clean. At a target both guns made a very even distribution of the shot, with extreme penetration.

Sir—The Greener breech-loader I purchased of you is very fine indeed, and gives great satisfaction.

WARREN, Pa. ROBERT DENNISTON.

W. W. GREENER, St. Mary's Works, Birmingham, England.

THIS IS A

Foot Rule, Level, Square, Plumb and Inclinometer.

It may be used for leveling sounds for rest shooting, and gives at once the degree of elevation and pitch to the foot. As a specimen of workmanship, it is faultless, and is strong and durable. So great is our confidence in its merits that we hereby agree to refund its cost in every case where perfect satisfaction is not given. Sent by mail on receipt of \$2.50.

STEPHENS & CO., Riverton, Conn. Nov 11

## Three-Barrelled Breech-Loading Guns, TWO SHOT AND ONE RIFLE.

A new feature in the Sporting Line. Forms a light and compact gun from eight to ten pounds, giving to sportsmen the very thing so often wanted in all kinds of shooting.

PRICES—Three barrel, \$75 to \$350. Double barrel shot guns, Damascus barrel, \$50 to \$200. Twist barrel, \$35.

C. J. STODDARD & CO.,

Lock box 192, Washington, D. C.

## IRA A. PAINE'S CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell. We can give the sportsmen of America no better proof of the superiority of these balls than that W. & C. SCOTT & SONS, after examining every ball in the market, have ordered 2,000 to be sent to England. In no instance where it has been exhibited has it failed to take the place of all others.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

## PAINE'S PATENT Feather-Filled Glass Balls and Huber Traps.

MESSRS. WILLIAMS & POWELL HAVE ORDERED 30,000 OF THE FORMER, AND FORTY OF THE LATTER. THEY WILL BE SHIPPED FOR ENGLAND ON SATURDAY NEXT. THIS, WITH THE LATE ORDER FROM W. & C. SCOTT & SONS, EFFECTUALLY ESTABLISHES THE SUPERIORITY OF THE

## PAINE FILLED BALLS AND THE HUBER TRAPS.

Dec 13 1m

## Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

THE ABOVE TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$5.

W. & C. SCOTT & SONS have ordered 10,000 balls and 24 traps to be sent to England.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street.

## Blackbeard.

"A rakish craft fast plows the sea,  
And sails amid the blast;  
Instead of pennant hung aloft,  
The black flag trails the mast."

WHAT an intense but indefinable fascination exists in every breast for the thrilling adventures of the pirate—that Ishmael of the ocean—who, warring against all mankind, is hunted to the death by the armed ships of every nation; his hand against every man and every man's hand against him.

There is a halo of romance thrown around the bold buccaneer, which neither his fearful crimes nor bloody end can dim; for the love of the heroic is strong in every heart, and we can but admire the desperate daring, the superb madness that, counting all cost, nails aloft the black flag, with its skull and cross-bones, and throwing to the breeze this emblem of death and destruction, flaunts a single desperate defiance in the face of the whole world. The exploits of the buccaneers have ever been the favorite theme of the novelist, the traveler and the historian. Infesting the bays, lagoons and creeks of the West Indies, they pounced upon the unfortunate ships that entered these latitudes. And not only did they attack "ships of war," but, increasing in boldness, and combining in strength and numbers, they swept the high seas, carrying war to every land. Like the hardy Norsemen of old, they sacked the towns and cities of the coasts, spreading ruin and destruction wherever they went.

There was the celebrated Morgan, who, like the great Dutchman, Van Tromp, could significantly have placed a broom at his mast-head, for he swept the seas of hostile fleets, and actually stormed, captured, sacked and burned the cities of Panama and Puerto Velo. Again, we have that accomplished and fascinating Frenchman, Capt. Mission, the Claude Duval of the ocean, who united the politeness of a Chesterfield with the ferocity and malignity of the fiend himself. Can we not now call him to the mind's eye, gracefully apologizing in the softest of tones and with the most courteous of bows for the cruel necessity which impelled him to make his despairing prisoners "walk the plank." And yet for the satire of the thing, which afforded him enjoyment, even if no one else could share the joke, he styled himself the Patriot of the Ocean; and instead of the suggestive skull and cross-bones, he carried flying at his fore a white flag with the goddess of liberty inscribed thereon. We read also of Captain Bellamy, who was as merciful to his prisoners as Mission was merciless. He lurked for a long time among the Florida reefs, and after a most eventful career was captured and carried to Jamaica, there to be tried and hung. We have also the famous women pirates, Annie Bonney and Mary Reid, whose lives read like veritable romances, and whose adventures surpass in reality the most improbable recitals of dime literature. These two women excelled the desperate men with whom they were associated both in bravery and cruelty. They were taken and tried in Jamaica in 1728, and, of course, condemned to death, but were afterward reprieved by the Governor, who, in extending pardon, gave that which they little deserved.

Captain Lorother infested the coast of North Carolina for years. There never lived a more callous villain than this man, who issued a proclamation declaring war against the whole world. Meeting a British brig of eighteen guns, he boldly engaged, and after a desperate combat was conquered. Then, surrounded by the remaining few of his crew, he sank with his vessel, his colors flying and guns firing to the last, passing grandly to his death.

Then, too, about the same time, flourished the celebrated Capt. Kidd, who, up and down the Hudson "sailed and sailed," as the old song hath it, putting in sore fright the merchants and shippers, those sturdy old burghers of New Amsterdam. It was at the head of this renowned pirate that the redoubtable Van Twiller, Governor of New York, launched such mighty curses; but the captain, like the dwellers of earth, passed away to another world, and left buried, they said, the bars and ingots of gold and silver and rich treasures captured from the Spanish galleons. But *where?* is the all important question that has never found an answer.

To this day there are strange tales of a ghostly crew seen in the dim, misty light, flitting among the secluded nooks of the Highlands, doomed, in expiation of their many sins, to linger by the treasure they lost their souls to win. And some there are who stoutly maintain that they know the exact spot where all these riches lie, but as they seem never to have been able to profit by the information, their assertions have but little worth, and the secret commands cheap sale.

Of all these rovers of the sea, John Teach, or Blackbeard as he was called, was the most remarkable. His origin is involved in obscurity, but he is believed to have been an Englishman, who joined the buccaneers while comparatively young, soon rising into prominence among those desperadoes by his utter fearlessness and indomitable will, supplemented by great physical strength. The details of his life are unknown until he bloomed into celebrity as the captain of a pirate ship off the coasts of Virginia and North Carolina some time in the early part of 1700. Making many captures and increasing his forces, he commanded two vessels and sailed along the coast from Virginia to New Orleans, in the Gulf of Mexico, and around the West India Islands; and woe to the vessel so unfortunate as to cross his path. Everything of value was at once appropriated, and if any resistance was made a bloody retaliation was exacted. Throughout the whole career of this man were united wonderful incidents, strange escapes, and most bloody, sickening details of crime—indeed his history only shows to what a total depravity and depth of wickedness a man's passions and caprices may sink him when unchecked by law and unbridled by restraint. Blackbeard was most remarkable in that he was the right man in the right place; for this much can be said of him, and truly, that if there ever lived a more bloodthirsty, hardened wretch, history does not tell of him. There never were probably more evil qualities condensed in one man before, and to say this is not to speak too strongly. Cruel, utterly remorseless, ferocious as a tiger, dangerous even in his better moods, terrible when the light of angry passion gleamed from his eyes, he was in verity a devil on earth. He had friends on shore and among the skippers, to whom he gave great quantities of rum and tobacco, but the majority even of these feared him. From the Governor of the Province down to the humble fisherman on the shore, his name was a terror and a dread. Many a childish timid heart has been hushed into terrified, choking silence by the very sound of that name, the fear of him looming over its young life like a great shadow to darken it. "Blackbeard is coming! Blackbeard is coming!" uttered by the lips of thoughtless, selfish mothers, was as potent to hush the wailing cry into suffering stillness as the threat of Black Douglass was to the Scottish children of the olden days.

The smugglers and hucksters of the coast feared and distrusted him; for, though he rarely disturbed them, it being in his interest to keep on good terms with them, yet they never knew what savage impulse might move him, and hence deemed it safer to avoid his dreaded presence.

On one occasion, while cruising off Cape Charles, near Hog's Island, Blackbeard ran down and captured a Virginian vessel, laden with lumber. The ship was of that class of non-combatants whose taking could do him no good, but on the contrary incalculable harm, should the enmity of these sea-faring men be once aroused; for thereafter his hiding-places in the creeks and inlets would, from mere precautionary measures, be conveyed to the naval vessels already on the search for him, and so his death or capture become a matter of absolute certainty, and that without much loss of time. Well, Captain Dory, of the schooner Seafowl, as the old chronicles tell us, was sailing placidly along with just-enough wind to fill her sails, the steersman keeping the helm straight by a slight touch of his hand, the while the bronzed old master sat at the prow and watched the pirate craft tacking toward him. Did there pass through the brain of the honest "toller of the sea" who earned his bread so hardly, an envious wish for the gain of the man winning an easy, reckless livelihood with such facility? Or was he thinking, in his rectitude and peace of mind "that the way of the transgressor is hard," and that the balances sooner or latter are adjusted with an even hand? Be that as it may, his deep meditations were suddenly broken by a hail from Blackbeard to "heave to." The helm was put down, the foresheet hauled to windward, and the schooner drifted idly on the water.

From the pirate's vessel a boat was lowered and in it lightly dropped some six men besides himself. A few strokes of the oars and Blackbeard stood on deck. The skipper believed the captain wanted information and had no fears, but he was soon undeceived. Blackbeard had but recently captured a brig from Bordeaux, bound north with a cargo of wine and tropical fruit, the former of which he transferred to his own ship. The affrighted captain was generously permitted to continue his voyage, bereft of his treasure to be sure, but with his life safe, and what will a man not give for his life? Blackbeard, on the high seas, always kept his men in order; but once within his haunts he allowed them the wildest license and surpassed them in all their excesses. On this occasion he was in one of his maddest moods, but as jovially inclined as he was intoxicated. This the skipper perceived as soon as the dangerous visitor touched his deck, and most heartily did he wish him away. But his guest ordered his men to bring on deck a cask of rum and claret, as was done. Then filling an immense silver punch bowl to the brim, tendered it to the skipper. The invitation was accepted, and a moderate amount partaken of. But on handing back the bowl, Blackbeard commanded him to drink *all*. The man demurred, upon which the pirate declared with a mighty oath that the last drop should be drained. A point blank refusal was the answer, and here this bold buccaneer jerked out his pistol and, cocking it, placed the cold muzzle to the forehead of the man, giving him, with another deep curse, his choice to "drink or die." In this day many a man would rather have enjoyed the dilemma—for they drink till they can hold no more—drink and die; but the old skipper, it seems, liked moderation only second to his life. But his life was the dearer, and so he drained the flowing bowl, even to the last drop; and if the fumes at last mounted rapidly to his brain, was it any wonder? And can we not stop to drop a tear of pity over his prostrate head, inasmuch as he was the first and last man who ever became intoxicated on compulsion? Blackbeard was in a generous mood, and insisted on the whole crew drinking till they lost their senses; nay, he found the wife of the skipper in the cabin and actually made her share the contents of his tankard. Then this hospitable pirate left, laughing until his thick beard quivered and his huge sides shook. And as he sailed away, the bacchanalian shouts, the drunken laughter, the mad revelry of the schooner's crew floated wildly over the peaceful water.

This was Blackbeard in his merriest moments. But some of his drunken caprices surpassed in devilry even his cool ferocity.

One night, after a successful marauding excursion along the coast, he invited the pilot, the sailing master of a schooner, and some of his own crew to take supper with him. After the substantial was cleared away and the debauch begun, and Blackbeard with his splendid voice had sung a sea song, all hands joining in the chorus, the mirth waxing fast and furious as the potatoes became deeper, he slyly drew a pair of pistols and discharged them at random beneath the table. One bullet entered the floor, but Hanks, his sailing master, was shot in the knee and lamed for life. When asked what motive prompted the deed, he replied by cursing them, and said if he did not shoot one of them occasionally they would forget who he was and cease to fear him.

But now, to describe this redoubtable buccaneer, and fortunately history and local tradition have preserved his likeness and physique complete.

John Teach was over six feet in height, as straight, too, as an arrow, with the frame of the Farnese Hercules. He always claimed to be of a gentle descent, and would point in proof thereof to his small ears and hands, of which, by the way, he was inordinately vain. Be that as it may, he was a striking, but savage-looking man, with a winning tongue when he chose to use it, and one that talked away the heart of many a poor trusting woman; for it is worthy of observation that the weaker sex care less about a man's character or antecedents than they should, provided he can charm or amuse them.

*Woman's Parenthesis.*—(They will be very apt to believe every word that proceeds out of his mouth, and take his own version of himself and his past against the verdict of the world; and we know very certainly a man is apt to say favorable things of himself, especially to a woman whose admiration he seeks.)

Marian Holcombe in "The Woman in White," when she speaks of Count Fosco, makes this admission in her diary: "A woman can withstand a man's devotion, a man's wealth, and a man's beauty, but no woman can withstand a man's tongue when he knows how to talk to her."

Shakespeare makes Valentine say:

"I told him no man,  
If with his tongue he cannot win a woman."

At any rate Blackbeard was a Lothario and had a wife, and any number of sweethearts in every port. The beard which gained him his *soubriquet* was indeed extraordinary. It grew beneath his eyes and was blue black in hue, thick, bushy, and of an extravagant length. His favorite mode of wearing it was in small plaits in which were interwoven different colored ribbons, after the manner of the old Ramelies wigs. On his courting expeditions, and when he attended festivities on shore, he wore a cocked hat with red plume, blue frock coat with silver buttons, velvet waistcoat, shorts, and shoes with diamond buckles. His hands were covered with rings, set with jewels of great value; a gold mounted sword hung from a handsome belt, and completed this remarkable costume. In time of action he carried, slung over his shoulder, three brace of pistols hanging in their holsters and a cutlass of great weight unsheathed in his hand. To add to the picture, he stuck lighted matches under his hat which reflected weird light on his face. His eyes were brown and gleamed like fire when he was excited. Altogether, it was such a figure than which imagination could not form an idea to look more frightful. He spent much time on shore, and was there far more welcome than among his crew, for he was obliged to curb his bloodthirsty propensities to a great extent, and besides scattered his gold with a lavish hand among the peasants and farmers of the provinces, with whom he mingled freely. His was rather the Claude Melnotte style among the women he visited, and of whose society he was ever fond, lavishing upon them a large portion of his ill-gotten gains. And Artemus Ward would call him now "a muchly married man," for his legal alliances only numbered twenty-two. These poor, deceived women, fascinated by his prowess, his winning address and lavish generosity, married him in all good faith, and were most respectable people. From New Orleans to Norfolk he would sail, visiting his many wives, but keeping such news of his unfaithfulness a profound secret from each unsuspecting spouse. How this was managed will ever be a matter of wonder, evincing, as it does, a tact and strategy most remarkable. Never to have aroused the suspicion or jealousy of so many women—to have made each one believe herself to be the one, opens up such vistas of deceit, diplomacy, cunning and falsehood as almost to pass comprehension. It is a singular fact that some of the proudest families of Virginia own Blackbeard's name as entitled to a place on their family tree, and the pirate's blood to-day mingles in the veins of many of her purest aristocracy.

Every villain has some redeeming trait; few are wholly bad. Our pirate—like Conrad the Corsair—had his "one virtue to a thousand crimes." Never was he known to break his word when he swore "by his beard," that one oath was inviolate. In this he followed the ancients, it seems. Their beards were worn long and flowing, and were considered symbols of wisdom and philosophy. To swear by one's beard was to give the deepest possible pledge of veracity; and to pluck a man by his beard was the greatest indignity that could be offered. Not for the same high motive as the old Greek philosophers did Blackbeard tend his own so graciously, and make it the foundation of a truthful oath. He was inordinately vain of it, and cared more for its awe-inspiring effects than for anything else on earth.

"His whiskered muzzle looked so wondrous grim,  
His very shadow was afraid of him."

And hence, as if his strength lay, Sampson-like, in those flowing locks, he made them the only faith he had—"by my beard!"

Among the brotherhood of pirates it has ever been the unwritten law that the greatest hero is he who performs the most cruel and desperate deeds. Blackbeard leads the van unrivalled. He so played upon the fears and superstitions of his own men that they devoutly believed his familiar consort was no other than his Satanic Majesty. They averred again and again that a strange person could be seen in the captain's cabin, who would come and depart at will when they were hundreds of miles at sea, and that it was the self same Satan, whom, it seems, they feared only second to their master.

On one occasion, when anchored near shore, Blackbeard, thinking that his men were becoming too familiar, requested that they should try and make a purgatory of their own (to express it mildly) and see how long they could bear it. Accordingly, several of his crew went with him into the hold of his vessel, closed up the hatches tightly, and setting on fire several pots of brimstone, waited amid the horrible fumes to see which had the most endurance. At last the men became exhausted, and crying out for air, crept out nearly dead. But Blackbeard sprang on deck, laughing loudly and saying with horrible blasphemy that those lower regions would suit him hereafter better than any other place.

And in this way this pirate lived—cruising the sea, taking with high hand what he wanted, dealing death to one and all without delay what the least resistance offered. For years he carried on this nefarious trade, robbing, burning and murdering until retribution seemed a myth. Many armed ships were sent to take him, but retreating to the coasts, and hiding in among the tortuous inlets and channels, he would lie concealed until all danger was past. Besides, Blackbeard had numerous friends who gave him timely warning of foes, and among these was no less a personage than Gov. Eden, of North Carolina. It was suspected that he shared much of the pirate's plunder: be that as it may, he was certainly leagued with him, and aided him in every manner.

Time passed and the buccaner grew more and more overbearing. Continued success blinded him to caution, and soon he commenced to oppress the small traders and skippers along the coast, and permitted his men to plunder at will the plantations and farms that lined the shores. The consequences of this could have been easily foreseen. From being quasi friends these oppressed people, rising patience at last, became bitter enemies. Finally, when the continued exactions of this robber threatened their ruin, they sent a delegation to Gov. Spotswood, of Virginia, setting forth their grievances and imploring aid. To insure his capture they declared themselves able to reveal his hidden haunts. The governor promised, as soon as might be practicable, to grant their prayer.

In the meanwhile Blackbeard started on an important expedition, and instead of stealing along the coast as was his wont, put boldly to sea. On reaching the mouth of Charleston Harbor, he sailed defiantly up and dropped anchor in front of the city. In fact he captured the place, but only demanded a chest of medicine of the governor, who, glad, doubtless, to get off on such easy terms, readily acceded to the request.

Blackbeard then levied contributions upon the shipping in the harbor, which amounted to fifteen hundred pounds, and as much wine and as many provisions as he could conveniently stow away. Then with his money, his wine, his medicine and his stores, he complacently sailed away and left the plundered to their own saddened reflections.

Turning his vessel's prow homeward, he stopped at Newbern, and as a matter of idle form, surrendered himself to Gov. Eden, who promptly gave him a full pardon. After this the pirate roamed through the interior of the State, and spent his ill-gotten gains with a lavish hand. He won the heart of a beautiful young girl, only sixteen years of age, while on this trip, and married her, the governor performing the ceremony. After a very short honeymoon, he treated her barbarously, and spent his time in the maddest debauchery. When his money was gone and he had become satiated with pleasure, which did not take long, we may be sure, he joined his vessel, lying the while in the sound, under command of his lieutenant, and sailed for the West India Islands. When near Porto Rico he fell in with a French Gunneymen, and captured her, with an exceedingly rich cargo. Then, with his own crew transferred to her, he mounted her with forty guns and made her his own consort under the name of "The Queen Anne's Revenge." Cruising off the islands thus reinforced, he captured a large vessel, which he plundered and burned. As the crew made no resistance, he handed them without killing any of their number. A few days after this, the British man-of-war, "Scarborough," of thirty guns, caught up with Blackbeard, and a lively fight was the consequence. But so well did the outlaw manoeuvre and handle his guns that the "Scarborough" retired from the conflict, with her hull battered in and many of her crew killed and wounded.

After these exploits, Blackbeard sailed for his hiding-place. More than ever he was led away by his overweening vanity to believe himself unconquerable and to defy all consequences; more than ever did he plunder and oppress all with whom he was thrown; more deeply did he steep his brains in the maddening fumes of liquor. But the end of this bad man was approaching. Outraged justice was about to exact her toll at last. The finger had traced the hand-writing on the wall. The sands of his life, though little he dreamed it, were nearly run.

The Governor of Virginia had not been unmindful of his promise, and when he heard from many sources of Blackbeard's return and increased excesses, he offered a reward of two hundred pounds, and in a proclamation urged that one and all should try and capture this lawless, bloody freebooter. There happened to be two British men-of-war anchored at this time in James River—the Pearl and the Lime—to the men of whom this appeal came with all that force and charm which exciting activity and hope of reward invariably bestows. Lying in the stream and swinging with the tide was not pleasant to the men who had breathed the air that blew over the ocean and tossed his granite old waters mountain high; who had felt every timber in the vessel strain with the resistless pressure, as under their handling the sails caught the wind and dashed her through the waves with the wild free liberty of a bird of air. To these men, therefore, the capture of Blackbeard had a resistless attraction. They gladly entered into a compact with the governor, he on his part to furnish two sloops and they to volunteer to man them, Lieut. Maynard, of the Pearl, to command the party.

Maynard was a fit leader. Brave as a lion, and withal as handsome as he was brave. I have before me a letter all yellow with age, written in 1720 by the daughter of a noted Member of the House of Burgesses in Williamsburg; and this lady, who was a reigning belle, they say, writes that "the handsome and gallant Lieut. Maynard was the most observed of all at the governor's reception, and that his large brown eyes were as soft as a dove's and his voice as low and gentle as a woman's."

Yes, Robert Maynard, of the Pearl, was undoubtedly the right man for the dangerous task he was about to assume. To hunt Blackbeard in his chosen fastnesses was to court death. To lead the van of a forlorn hope could hardly have been more desperate, and fearless must have been the heart and firm the determination, and cool the brain that counted the cost, cast up the danger and yet went forth "to do or die" unflinchingly.

The sloops were soon ready and were well manned by a picked crew from both vessels. Small arms and ammunition were furnished, but no guns were mounted. All being in readiness, the governor then convened an extra session of the Assembly, and it was resolved to issue a proclamation. The curious old pronouncement reads thus:

#### PROCLAMATION.

"That any person or persons who shall, after the 14th day of November, 1719, take any pirates on sea or land between the degrees of 34 or 39 of N. L., within one hundred leagues of the continent of Virginia or within the province of Virginia or North Carolina, upon conviction or upon due proof of the killing of all and every such pirate before the governor, shall be entitled to have and receive out of the public money at the hands of the treasurer of this colony the several rewards following:

"For Edward Teach, called Blackbeard, *One Hundred Pounds*; for any other commander of a private ship, *Forty Pounds*; for every master or inferior officer, *fifteen pounds*; and for every private man or common sailor taken on board each sloop or ship, ten pounds.

"Given at the Council Chamber at Williamsburg, the 24th day of November, 1718, in the 5th year of His Majesty's reign. God save the king! SPOTTSWOOD."

(To be Continued.)

#### SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

—The celebrated racing mare Flora Temple died last Friday at the good old age of thirty-three years.

FALL RIVER, REDUCTION OF FARE.—This fine line of steamers between New York and Boston have reduced their fare. The figures are now \$3 from New York to Boston, and to go and return, \$5. See advertisement.

## Natural History.

### ECONOMICAL APPLICATIONS OF REPTILES.

MR. P. L. SIMONS, in a communication to the Society of Arts in London, calls attention to the extent to which reptiles are used in supplying the needs or luxuries of mankind. Beginning with the tortoises, he remarks that the flesh of nearly all the species is eaten, especially in the United States, where the Florida gopher, the land tortoise, the box tortoise and especially the terrapins are highly prized articles of food. To these he might add the employment of the snapping turtle, which, when properly dressed, is equal in flavor and tenderness to any of the species.

The green turtle is used very largely wherever it occurs, and is carried in great numbers from the tropical or semi-tropical seas to other regions, notably to the United States and Great Britain.

Mr. Simons refers to a manufactory at Key West in Florida which puts up 200,000 pounds annually for exportation, and employs ten vessels and sixty men in collecting the turtles, this supply being sent chiefly to England and Cuba.

There are establishments at Jamaica for canning and similar preparations of the turtle, including the fat, calipee and gelatinous portion of the fins. 5,484 pounds of prepared turtle were shipped from Jamaica in 1874. The turtles of the Bay of Honduras are esteemed in England as the best brought to that market. Jamaica is the shipping point, the turtles being brought there from the shores of the Gulf of Mexico, from Trinidad, Vera Cruz, Honduras and the Tortugas.

The eggs of the sea tortoises or turtles are said to be very nutritious. Several thousand persons are engaged in the season in collecting eggs of the Orinoco and Amazon turtles, and manufacturing from them a rich oil.

Another economical product which is derived from turtles is tortoise shell, of which an average of twenty-five tons is annually worked up in Great Britain.

Among the Saurians or lizard family the alligator and crocodile are the most important, the skins of many species being tanned and converted into excellent material for horse trappings, boots, shoes, &c. The flesh and eggs are also eaten in many parts of the world. In Central America the musk is extracted and used in perfumery, and the teeth, as also in North America, are carved into ornamental objects, and the oil is of considerable value in the arts.

The eggs of the iguanas and other large lizards are very highly esteemed as food. Their flesh, too, is very palatable being destitute of that highly musky odor that renders that of the alligator so offensive to some persons.

Serpents are largely used for food, the flesh of the land species, especially, being white, tender and well tasted. The larger snakes, such as the anacondas, furnish an excellent variety of leather, which is used both for shoes, trappings and for covering sword sheaths and instrument cases.

#### THE BLACK OR COW BIRDS.

Mr. Editor—In a recent issue of your paper I observed an article (I think taken from a Pennsylvania paper), in which the writer is at a loss to account for vast numbers of black or cow birds (?) occupying as a roost a certain cemetery and flying from said roost in a given direction every morning.

Your answer that "there is probably winter wheat in the direction of their flight" is more than probable—that there is food in that direction in sufficient quantities, so long as it may last for their requirements, is beyond question. This thing of food fetches to Houston city, Texas (the second city in the State), large numbers of these little fellows, who may be seen at any time hopping nimbly around in the middle of the main thoroughfares and gutters, busily engaged in filling their crops; and be it said to the credit of the little gentry of the "Bayou City," the writer never saw or heard of any one of them molesting the birds in the slightest degree. Often these birds may be seen perched upon the back of the oxen attached to the long cotton trains, and upon the dray-horses—where in perfect contentment they seem to enjoy city life to the full. This was at any rate the case in 1861-'2, and I am confident is yet the case.

With regard to the cemetery part of the business, what better place could be desired for these birds? retired, quiet—the very place of all others where these little rascals can sleep through the long hours of the night, or else, with their heads tucked beneath their wings, reflect at their leisure upon the mortality of all flesh! The question could have been answered, however, as a little negro answered a gentleman's question with regard to a flock of domestic ducks which the gentleman came across in a quiet part of the road, far from any habitation. Gentleman, soliloquizing half aloud: "I wonder whose ducks those are?" Little negro, in the corner of the fence (who was unperceived by the traveler) "De's de own ducks, de is; and de go whar de choose, de do." So with the birds: de's de own birds. BIRD SHOT.

New Teyman's Store, Spotsylvania Co., Va., Nov. 27, 1877.

#### PECULIAR PLUMAGE OF QUAIL.

SCHUYLKILL HAVEN, Pa., Dec. 8, 1877.

EDITOR FOREST AND STREAM:

Sir—While on a gunning trip thirty miles west of Harrisburg, Pa., I came across a flock of birds about fourteen in number, one of which was shot and resembled our quail or partridge in shape of body, but not in color. It was not so brown, more of a drab with shorter and rather thicker legs, and shorter and rather yellowish toes. Each side of head white and extending nearly over the top of head, leaving but a small strip of dove color on top of head. Tips of each wing white (last joint). Plumage very soft. Can you tell me what it was. D. B. PEALE.

[We have to thank Mr. Peale for his letter, but we hardly think the birds he mentions are a new variety. Similar birds were shown us by Mr. John Sutherland this week in New York. The plumage was much lighter, perhaps as much as two shades lighter; but these differences were so slight as

hardly to be worthy of more than a passing notice. A letter already published from Judge Everts, where he describes the migratory quail, will be found to be of interest.]

**THOSE QUAIL NOT ALL GONE TO SEA.**—The following communication contains good news for those who are watching with interest the result of the migratory quail experiment. Let us hope for still further reports of an equally gratifying nature:

SAYANNAH, Ga., Dec. 10, 1877.  
Mr. Editor—Let your friends, Judge Everts, and Mr. Maygood, of Boston, take heart. Their European quail have not all gone to sea. They are here in considerable numbers. I have, on three several occasions, found them during my shooting excursions in this vicinity. The first time I noticed them was about the 15th of November, when I shot one before I observed that it was not a native bird. I recognized it at once as a true "*Coturnix coturnix*," being perfectly familiar with that bird, as I have often shot them in Egypt as well as in the south of France and in Africa. Two or three days later I saw them again, and at such a distance from where I saw them at first as to preclude, in all probability, the idea that it was the same bird. I am well convinced that there are at least three flocks of the birds safe from the perils of the sea.

I congratulate the sportsmen of the country upon the apparently successful introduction of this rare game bird to America, and especially do I congratulate the public spirited and liberal gentlemen who inaugurated and so ably worked out the scheme of their importation. That they will return north with the spring, I have, from my intimate knowledge of their habits, no doubt whatever. So let us have peace. Very truly yours,  
JOHN A. READY.

MANGOKIKE, Richmond County, Va., Dec. 17, 1877.—Having made a special study of the migrations of birds, I have been much interested, both as a sportsman and ornithologist, in the introduction of quail (*Coturnix coturnix*) into America, and recognized at once "Virginia's" description as applying to these birds. Although Mr. Everts is hopeful, Mr. Maygood seems rather despondent in regard to the chances of their birds over being seen again in New England. The occurrence of birds alighting on vessels far at sea is a common one, many land birds flying over the water in migrating, and I should consider the fact of so many quails being seen both at sea and ashore, during migration, encouraging rather than otherwise. In firm belief, I predict their appearance next spring at their breeding places of this year, and hope to see their arrival heralded in F. AND S.

EVERETT SMITH.

**ARE THE PRAIRIE CHICKENS GOING TO CALIFORNIA?**—A very curious fact is brought before us in regard to a movement of the prairie chickens. If it be true, and the authority which calls the circumstances to our notice seems worthy of credence, it illustrates something quite remarkable in the history of our game birds. In California the absence of prairie chickens had been long known. Some years ago efforts were made to introduce them, but apparently without success. Now it seems that of their own accord this bird, the true *Cupidonia cupido*, has made its way into Northeastern California. Starting from the Nebraska plains, the prairie chickens, whether driven by hunters or otherwise, have followed the track of the railroad. We may state that the first reports of the presence of this bird in California was received with doubt, but as their appearance has been noted year after year more to the westward, at present it looks as if a migration were possible. The San Francisco *Chronicle* of last month says that naturalists and hunters announce the existence of the prairie chicken in California, not to be confounded with the sharp-tailed grouse which was already known to live there. The prairie chicken is said to be found to-day in the Shasta Valley, in Battle Mountain and Winnemucca. We await further developments. Still the bird is one so easily recognized that we hardly think a mistake can have been made in regard to it. If the report be then true it shows the possibility of these birds taking up an entirely new habitat. The reason for this change of habitation may be due somewhat to the aggressive warfare waged on them for years. The history of the bird, and of its movements are worthy of thorough study. It is well known that in early times Long Island abounded with the *Cupidonia cupido*. We should be very glad if some of our friends on the Pacific side would send us a specimen for examination.

**JACK-SNIPE IN COLORADO.**—A parallel to the introduction of pinqued grouse into California is found in the migration of jack-snipe into Colorado:

EDITOR FOREST AND STREAM:  
In a recent communication to your columns from Colorado, I noticed the statement of a very successful sportsman that he had never found jack-snipe in the State, and he seemed to doubt their presence. In the last week of September, this year, I was coming in over the Boulder Valley Railroad, when within about thirty miles of Denver we picked up Col. F. F. Griffin, superintendent of the road, who had two dozen jack-snipe in his bag that he had shot that afternoon in two or three stubble fields along the track. During October he made three other visits to the same range, and killed respectively thirty-nine, twenty-eight and nineteen of the same birds. Upon one of these occasions he was accompanied by Col. Potter, master of way on the K. P. road, who also got a good number of birds, though just how many I am unable to say. The jack-snipe has come in since the settlement and cultivation of the country, and may be found in all the agricultural valleys at certain seasons. B.

DENVER, Colorado, Dec. 12, 1877.

## BITE OF THE SKUNK.

EDITOR FOREST AND STREAM:

I see by the last number of F. and S. that the bite of the skunk (*M. M. americana*) is fatal; consequently, I must consider myself a dead man, but yet wandering in spirit upon this earth. Some six or eight years ago, I had some "twich up" snares set in a locality where skunks were very abundant. One morning I found a skunk suspended in one

of them; the noose was slipped quite tightly around him just forward of the hind quarters. A friend with me assured me that the animal could not dispense his essential quality while in that position, and so after a few preliminary experiments we approached him. While stroking him on the side he suddenly turned his head and seized one of my fingers, two of his canine teeth making quite deep wounds, especially as I snatched my hand away quickly. The wound caused me no pain and soon healed. A bite from a wounded gray squirrel which I received only a short time afterwards in the same finger led to much more serious results.

R. T. M.

[We are much obliged to our correspondent for the information, and glad to know that he is yet alive. We must differ from him, however, in his comprehension of the article on skunk bites, for, like him, we do not believe that skunk bites are at all dangerous, and we doubted the authority of Col. Dodge who stated that no man ever lived after having been bitten by a skunk in Dacotah.—Ed.]

## AN ILL TO WHICH SQUIRREL FLESH IS HEIR.

BUFFALO, N. Y., Nov. 26, 1877.

HUNTERS are still much at loggerheads in reference to the often noticed absence of testicles in the black squirrel. Since the pugna-cious red squirrel is often seen chasing its much larger congener from tree to tree, the wild hypothesis has gained firm ground that the testicles of the former are its point of attack. There is no need paid to the analogous cases of jay and crow among the feathered tribe, when pursuing the much larger and powerful hawk or owl; it is sufficient to observe an obvious effect to make a hasty deduction, which lacks the force of accurate and exhaustive observation.

The neighborhood of St. Thomas, Ontario, has been, during the last month, the Mecca of all squirrel hunters from near and afar. Several small parties have succeeded in bagging, in a few days' hunt, as many as 600 larks; and it has been ascertained by special request, that fully one-third of the animals were devoid of testicles, without, however, giving from their appearance any evidence of injuries received externally. In all of the cases there was simply an absence of the organs noticeable, but no wound or ulceration of any kind.

By referring the problem of these cases recently examined, to Prof. Groe, the Director of the Buffalo Society of Natural Sciences, we learn from this accurate and clear-headed observer that, according to fortunate observation on the part of the late Mr. Fitch, of Albany, an insect, not a co-elliptic mammal, is the true cause of this mysterious phenomenon. It appears that Mr. Fitch succeeded in discovering, during his frequent examinations, a white larva of some hemipterous insect, which he placed carefully in a vessel containing loose soil, to facilitate its transformation into the pupa state. This was accomplished in a few days, and shortly after, a then undescribed species of bot-fly, named the *Postus emaculator*, made its fully-developed appearance. The surprise could not be extreme, as the larvae of this family are in the habit of burrowing under the skin of the ox and other ruminants, which are thereby afflicted with the peculiar sores so well known to all herdsmen. It is supposed that the *emaculator*, in harmony with the habits of its congeners, deposits its egg on the testicle of the black squirrel, as the ichneumon does upon the large larva of the Platysamia, and that after the development of the egg into an immature larva the latter manages to generate an *A. dermis*, and to live at the expense of an organ which is not indispensable to the life itself of the squirrel. It seems strange, however, that this deserving observer places much reliance upon the reports of what he considers trustworthy persons, who assured him of having, time and again, positively witnessed actual attacks upon the black squirrel by the red with the view alone of destroying its testicles, as has been, from time to time, noticed among certain breeds of dogs.

The problem calls for communications from all who have accurately observed the habits of these animals, in order to settle this much-discussed and perplexing question.

CHAS. LINDEN.

**BLUE BIRDS.**—NEW HAVEN, Dec. 19.—I saw ten blue birds flying around this morning and chirping as in the spring. Is it not something unusual?  
VERD MONT ABROAD.

[The incident was an unusual one. It is, however, in keeping with the spring weather of the past week. The birds doubtless find plenty of food, for the air is full of insects. Ed.]

**THE NESTING OF THE SNIPE.**—Our friend, Dr. T. M. Brewer, the well-known authority on matters oological, sends us the following note, which will be new to many of our readers. Writing from Boston, Mass., under date of Dec. 3, he says:

"The nesting of the snipe in the southern part of New England and in the Middle States is not so very rare as some suppose. I have in my cabinet an egg taken by Mr. Ashmead in the Delaware marshes, near Philadelphia, and given me by the late Mr. Cassin. I have another taken by Dr. Holden, now in Stockton, Cal., in New York, near the Pennsylvania line. Mr. Betty wrote me several years ago of his breeding near Springfield, Massachusetts, and also near New Haven, Conn. In both cases, early in June, he found the young when only a few days old. In 'Lewis' American Sportsman,' page 184, you will see that in May, 1846, as Mr. Lewis was crossing an estate in Maryland, he started one of these birds from an outfall, and, searching, found its nest, containing four eggs. I might name other cases that have come to my knowledge of a like nature."

## BRANT IN TEXAS.

EDITOR FOREST AND STREAM:

In your issue of Nov. 15 I notice that Mr. Greene Smith desires to ascertain positively if the true brant ever leaves salt water a hundred miles. I have killed what were called brant by all who saw them near Palestine in this State. They were feeding near a small salt pond called the Saline, and some ten miles south of Palestine, not far from Trinity River. They were evidently on their way south, and were tired out, or unfamiliar with the figure of a man, as I approached them near enough to kill some with shot without much cover.

Vast numbers of wild fowl pass over this region during the migratory season, and sometimes seem very much exhausted, frequently settling down at nightfall in the little ponds that are found in the prairies skirting Trinity River in great flocks. There are no large bodies of water at all in this portion of the State.

Mr. Smith should favor your readers with a full description of the brant he wants. If he will do so and will send a copy to J. L. McMeans, Palestine, Texas, I have no doubt but that he can get one, as he owns the saline referred to, which is frequented by wild fowl to a greater extent than any place in that region, if I rightly remember. Of Mr. J. H. Page, Gen. Ticket Agent, I and G. N. R. R. at Palestine (who sustains the reputation he brought with him, at least, for fair dealing), might throw some light on it. Yours,  
P.

Gulckston, Nov. 24, 1877.

**DRUMMING OF RUFFED GROUSE.**—A correspondent, W. E. D., adds his testimony against the hollow log theory:

I fully indorse the opinion of "Awahsoose" and many others that a hollow log is not at all necessary to produce the much disputed sound. I have shot them in various places, while and immediately after drumming, when a hollow log was not to be found. Through FOREST AND STREAM an interest in such matters has been awakened in me, and I have made some observations, although my chances are limited. While duck hunting I was hiding by a large pond watching some ducks, they would raise themselves up in the water to an upright position, and flap their wings with a quick, jerky movement, which produced a sound similar to that made by the grouse, but of course not prolonged. That this sound was not made on a hollow log I am sure, the wings did not even strike on the water. I presume others have noticed this as well as I, who am but a novice in the study of nature.

**HABITS OF THE WHITE FISH.**—The peculiar series of stripes or ridges on the back of the Lake Constance white-fish, noted in the Berlin, Germany, letter of Fred. Mather, F. and S., Dec. 13, have also been noticed in the species of this country, as will be seen from the following note:

UNITED STATES COMMISSION, FISH AND FISHERIES,  
WASHINGTON, D. C., Dec. 13, 1877.

EDITOR FOREST AND STREAM:

The fact, noted by Prof. Peters, and communicated by Mr. Mather, as peculiar to Lake Constance whitefish, is not unknown to the whitefish of the great lakes. In the breeding season—the month of November—many are found with the tuberculated points—rather similar in appearance and substance to those seen on the head of the "horned dace," (*Semotilus corporalis*), also called "common chub," and other species of the cyprinidae. My recollection is that the points were more prominent in large overgrown males than in others.

JAMES W. MILNER.

**QUEER OYSTERS.**—A paragraph, with this caption, is running through the columns of the newspapers. The story runs that the timid, peaceful oyster has taken to bloodthirsty ways. This does not mean that the oyster has become aggressive and flies at people like a tiger, but that when he is cut open or dislodged from his shell he sheds blood. We copy a portion of the article in question: "When the oyster is cut behind the heart or between the gills with a knife, blood spurts forth freely." This is indeed horrible! Imagine an oyster like a piece of rare roast beef! Well, what then? We are sure that, ensanguined as oysters might be, amateurs would still indulge in their art dozen on the shell. Pondering a little over this horrible tale, peculiar to the bivalves in and around Cape Henry, the eastern shore and Pocomoke Sound, and grieved lest some imaginative people should sicken over an oyster, we have arrived to this quite natural conclusion in regard to the mystery. It came on us like an inspiration, for reading the article of the bloody oysters had made us hungry, and forthwith we went into an oyster cellar and ordered some raw. Looking at the man opening the oyster we saw around the shell that peculiar red-looking weed, so well-known, called the coral weed, which grows around the oyster. When you take filaments of this weed and press it with an oyster knife, out comes a reddish fluid, which tinges the shell. Of course it requires some stretch of fancy to convert a rather brick-red water into a crimson fluid; but when in want of a topic, an imaginative reporter might call it "heart's blood." Eat, then, good people, your oysters in peace, and draw no dreadful portents from what is the most natural of things. Benign nature makes no queer oysters, and man's greatest boon remains over the same—bland, placid, and deliciously flavored, whether raw, roasted, stewed or fried.

**ARRIVALS AT THE GARDEN OF THE ZOOLOGICAL SOCIETY FOR WEEK ENDING TUESDAY, DEC. 11, 1877.**—One brown snake (*Storeria occipito maculata*), presented; two alligators (*A. mississippiensis*), presented. For Week Ending Tuesday, Dec. 18.—Two broad-winged buzzards (*Buteo pennsylvanicus*), presented; one common macaque (*A. cynomolgus*), presented; one common marmoset (*Leontideus jacchus*), presented.

ARTHUR B. BROWN, Gen. Snpt.

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

## WHAT THE EARTH-WORM DOES FOR THE FARMER.

WITH the progress of scientific investigation many of the vulgar prejudices of the past are fast dying out. Birds, so long regarded as the enemies of the farmer, because at certain seasons they appropriate a few kernels of grain or half a dozen berries, are now known to be his best friends, on account of their destruction of noxious insects; and the harmless toad, once so hated, is now, for the same reason, everywhere protected. The earth-worm has always been disliked by gardeners, and has been thought injurious to plants if, the general impression being that it gnaws the smaller roots, thus seriously interfering with the growth of the plant. This belief is thoroughly contrived by the observation of M. Hensen, who, after a series of observations extending over a number of years, is led to believe not only that there is no foundation whatever for this statement, but that the work of the earthworm is a positive benefit to the agriculturist in opening a way for young roots into the subsoil, and in hastening the transformation of recent vegetable matter into fertilizing material.

It is well known that the adult worms in damp or wet weather come to the surface of the ground at night, and with the hinder end of their body in the tube or hole, search the

ground immediately around them for leaves, twigs or any vegetable material which they can find. This they draw into their tubes and proceed to devour, the leaf being moistened and made soft, and then gnawed. Interesting facts were developed in the progress of M. Hensen's investigations in reference to the character of the worm-tubes, but we have scarcely space here to detail them. It is enough to say that there was always found a lining to the tubes of humus much richer than the surrounding soil. A portion of this lining is removed each day, and carried to the surface of the ground, where it is deposited, forming the well-known "casts." In about half the tubes not quite newly made M. Hensen found the roots of plants growing at the surface in the most vigorous development, running through the tubes to the end, and at that point giving off finer rootlets, which passed into the walls. It seems thus that the moist earth of the tubes, and the loose, rich and moist earth of the walls is most favorable for the growth downward of plant roots. The earth deposited by the worms, when submitted to microscopic examination, shows a close resemblance to the leaf mold prepared by gardeners for filling flower-pots. The plant cells appear to be for the most part destroyed, and altogether the chemical composition of the worm-earth appears very much like that of very fertile soil.

That this fertilization of the soil takes place much more rapidly than would be supposed, is proved by experiments of M. Hensen. He found in his garden nine open worm tubes to the square foot, and, combining this with other facts, he estimates 133,000 worms to the hectare, each worm depositing one half gramme of secretion in the twenty-four hours. This calculation, although of course good only for the locality where the investigations were carried on, gives an idea of the vast amount of good accomplished through this humble agent.

The author of the interesting and practical paper to which we refer sums up his conclusions as follows: "It is clear that no new manure material can be produced by it (the earth-worm), but it utilizes that which is present in various ways. 1. It tends to effect a regular distribution of the natural manure material of fields, inasmuch as it removes leaves and loose plants from the force of the wind, and fixes them. 2. It accelerates the transformation of this material. 3. It distributes it through the ground. 4. It opens up the under soil for the plant roots. 5. It makes this fertile."

M. Hensen's paper has excited considerable interest wherever it has been read, and there are not wanting writers to confirm, and even add to his conclusions. Two communications in a recent number of *Nature* are so interesting that we shall quote from them at some length. Rev. Henry Cooper Key says: "I thought it was a well-known fact that worms, by means of their 'casts,' effect a complete *renouement* of the soil of meadowland, down to a certain depth, in the course of a few years. But whether well known or not, met with a demonstration of this important fact in 1857. When putting down a considerable extent of iron fencing in the alluvial meadows near my house (consequent upon an exchange of land) I had occasion to cut a ditch two or three feet deep, and when the workmen had finished the ditch—a quarter of a mile long in all—I was astonished to see in one portion, about sixty yards in length, a distinct and very even narrow line of coal ashes, mixed with small coal, in the clean-cut surface of the fine loam of the ditch face, perfectly parallel with the top sward. It immediately occurred to me that this was the work of the earth-worm, and upon inquiry I found that the farmer who had occupied the land for many years remembered having once, and only once, carted out some coal ashes and spread it at this point not many years before. I forget the exact number of years, but believe it was about eighteen. I have a distinct recollection, however, that the depth of the coal ashes below the surface was at least seven inches, and that this seemed to confirm the general belief that the depth to which the earth-worm burrows is about that amount. I may add that the color of the loam above the line of coal ashes was decidedly darker than that below."

Mr. A. Stephen Wilson, in the same number of *Nature*, brings out a new point, and one of no little importance. He says, after speaking of the observations of M. Hensen: "But the operation of the earth-worm has a significance in relation to the vegetable world of even a profounder kind than that of the fertilization of the soil. Some months ago, in searching for young ash plants with three cotyledons, I found that in a great many cases the samara, or seed of the ash, had been drawn into a worm's hole, and had there found moisture and other essential conditions of growth, while the same seeds lying dry upon the surface had not germinated. There can thus be no doubt that many seeds of all kinds are drawn under the surface of the ground or covered by the earth thrown up by worms. They are thus preserved from birds and various enemies, and are placed in the proper position for germination. The dead plant is perpetuated from its fallen panicle by the earth-worm. An ash tree, or a whole forest of ash trees, may have been planted by earthworms."

**PLANTS IN SLEEPING ROOMS.**—So much has been said and written, and to so little purpose, on the injurious effect of plants in sleeping rooms, that we make no excuse in laying before our readers the following letter from Professor Kedzie, of the Michigan Agricultural College, to Governor Holt. He writes as follows:

Not to leave the matter in the condition of mere conjecture, I have gathered and analyzed specimens of air from a room containing a few plants. I gathered it from the college greenhouse where more than 6,000 plants are growing. I gathered the air before sunrise on the mornings of April 16 and 17.

The room had been closed for more than twelve hours, and if the plants exhaled carbonic acid to an injurious extent, the analysis of the air from such a room would certainly disclose this fact. The three specimens of air gathered on the morning of April 16, from different parts of the room, gave 4.11, 4.4 and 4.00 parts of carbonic acid in 10,000 of air, or an average of 4.05 in 1,000. The two specimens of air gathered April 17 gave 3.80 and 3.89 parts of carbonic acid, or an average of 3.84 parts of carbonic acid in 10,000 of air, while the out-door air in the greenhouse gave 4 parts in 10,000. It will thus be seen that the air in the greenhouse was better than "pure country air." This deficiency of carbonic acid was doubtless due to the absorption of carbonic acid, and consequent accumulation of oxygen during daylight, since the windows of the greenhouse were closed day and night on account of the cool weather. To ascertain whether the air of the greenhouse had more carbonic acid by night than by day, I gathered two specimens of air in different parts of the house at two o'clock P. M., April 17. These gave 1.40 and 1.38 parts of carbonic acid in 10,000, or an average of 1.39 parts, showing that the night air contained more carbonic acid than did the air of day. Now, if a room in which were more than 6,000 plants, while containing more carbonic acid by night than by day, contains less carbonic acid than any sleeping room on this continent, we may safely conclude that one or two dozen plants in a room, will not exhale enough carbonic acid by night to injure the sleepers.

**ALL ABOUT RAISING TOBACCO.**—The following very full information in regard to tobacco culture will be of value to many of our Southern readers. A correspondent, "E. L. F.," of Baton Rouge, La., inquires:

1. What does (a good crop) tobacco yield in value to the acre, and how does it compare in value with cotton?  
2. How many hands ought to be used on each acre of tobacco, and how does the labor of raising tobacco successfully compare with that needed for cotton? In our Gulf States but little tobacco is raised. It is not much cultivated South of Tennessee, and for this reason I am anxious to know how it compares with cotton.

3. Are lands suitable for cotton fit for tobacco?  
4. What will it cost me to have made to order in this country (if that is possible) a double-barreled breech-loading hunting rifle, positive action, carrying a spherical ball, 16 shot-gauge, with a slow pitch of rifling, one turn in eight feet, and who can make such a rifle?  
5. Where, and at what price, can I get a work on tobacco culture?

Ans.—1. There is a wide difference in tobacco as to quality and the market it is intended for. North Carolina grows the finest, brightest and lightest—some twenty plants to the pound—and brings the highest price in the markets, with the exception of a single parish in Louisiana, where the famous perique is cultivated. Missouri grows a coarse, heavy, thick, black-stemmed tobacco, some four or five plants to the pound, and is sold at a low price, and, as we believe, is made into pig-tail and negro-head for sailors' chewing in the European markets. Kentucky is rather finer class than the above. Connecticut cultivates tobacco for wrappers for cigars. Virginia grows, and has, up to the present time, cultivated the sweetest, and literally the purest tobacco for chewing and pipe-smoking, and is classed between the North Carolina and other southern tobaccos as to weight—that is to say about eight or nine plants to the pound. Tobacco is very low at present, the best Virginia bringing only 8 cents a pound, and would certainly not be cultivated if there was any other money crop. Its value per acre varies anywhere from \$30 to \$300 per acre, according to land, successful cultivation, curing and handling. It is a much larger crop than cotton. As soon as one crop is out of the ground and in the barns, preparations for another year ought to be begun, so there are always two tobacco crops on hand—one in the fields and the other in the barns, or what is termed "bulked down." 2. One darky per acre can attend to the cultivation. We should think, on the whole, that successful cotton growing would produce a larger pecuniary result, with less labor and risk, than successful tobacco growing. If this is not so, how is it that the planters of the further South, in slavery times, would give large prices for field hands in Virginia, take them South, and in three years would easily pay the price given for them out of the labor. This could never be done in the Middle Southern States. 3. The lands are probably suitable, but we should think the climate is not. 4. The rifle you require would cost from \$100 to \$150, according to workmanship. The Magazine rifle has superseded the double-barrel. The latter you can buy for \$40 or \$50. 5. We can send to you a little work, price 25 cents. A more exhaustive book would cost \$2.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—*Adas.* ABBEY & IMBRIE, 38 Maiden Lane.

—The *New York Times* has the following sensible paragraph, which it would do well for advertisers to read. The *Times* knows what it talks about:

The circulations of all the great newspapers have increased greatly during the last few years, and the advertisements in them reach a larger number of persons and are of more value to the advertisers than all the bills, circulars and "doggers," street-car legends, and colored Indian "sandwiches" that inventive theatrical and commercial people inflict upon the citizens of New York.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### POINTS IN JUDGING DOGS.

We continue our list of points used in judging dogs. For first part see our issue of Dec. 20th.

—In judging the points of the Dachshunds the printer made some slight errors. The points for Dachshunds should be as follows:

|                          |    |                              |    |
|--------------------------|----|------------------------------|----|
| Skull.....               | 10 | Feet.....                    | 7½ |
| Jaw.....                 | 10 | Stern.....                   | 10 |
| Ears, eyes and lips..... | 10 | Coat.....                    | 5  |
| Length of body.....      | 15 | Color.....                   | 5½ |

**WEIGHTS OF DOGS.**—A great many inquiries have been made of us in regard to the weights of dogs. An approximate standard of weights can however only be given. As is well enough known, dog owners do not breed to size or bulk as do cattle fanciers. On the other hand, in fancy dogs the smaller they can be turned out the higher they are prized. While a St. Bernard might be thought a good winner because he was the heaviest brute in the show, his bulk might be produced at the sacrifice of his symmetry. In the true sporting dog a medium size is what is wanted. The same physical advantage which a moderately sized man possesses over a pigmy or a giant is true as to dogs. Of course there are exceptions. All of us have known very big and very little setters and pointers whose performances have been superb. Still the exceptions prove the rule. A black-and-tan terrier may weigh from 7 to 25 pounds, but the best size is about 10 to 12 pounds. Skye terriers may weigh from 10 to 18 pounds; the Dandie Dinmont from 14 to 25 pounds. In fox-terriers the range is quite wide, being from 10 pounds up to 35 pounds. Bull terriers may weigh from 18 to 33 pounds, and some celebrated dogs have turned the scale at 55 pounds. Bull-dogs vary from 15 up to 60 pounds. The old bull dog, as taken from old pictures, must have been a larger dog, weighing as much as 100 pounds. A mastiff ought to weigh always over 100 pounds, say from 120 to 135 pounds. In Newfoundland it is quite desirable that some approximative standard should be given, which would include the large and small breeds; 80 pounds for the smaller breed, and 110 pounds for the larger dogs have been proposed. King Charles, 5 to 10 pounds. Italian greyhounds have been bred down to five pounds, but from 14 to 18 pounds are choice weights.

**THE USE OF THE RUSSIAN BATH AS A CURE FOR HYDROPHOBIA.**—As we have been requested to introduce Professor Buisson's cure for hydrophobia by means of the Russian bath, we publish the account, which is as follows. (This method of cure appeared as early as 1865, and was published by us in 1875). Having contracted the disease from a hydrophobic patient, after the symptoms were fully declared, Dr. Buisson writes:

"In this state, feeling that my course was preservative and not curative, I took a vapor bath, not with the intention of cure, but of suffocating myself. When the bath was at a heat of 53 deg. centigrade (93.55 Fahrenheit) all the symptoms disappeared as if by magic, and since then I have never felt anything more of them. I have attended more than eighty persons bitten by mad animals, and I have not lost a single case. When a person has been bitten by a mad dog he must for several successive days take a vapor bath *à la Russe*, as it is called. This is the preventive remedy. When the disease is declared it only requires one vapor bath, rapidly increased to 37 deg. centigrade, then slowly to 63 deg. The patient must strictly confine himself to his chamber until the cure is complete.

**EIGHT HUNDRED QUAIL, NOT TWO.**—We have to beg Mr. G. S. Fowler's pardon for an error of the types. We recorded the astounding fact that Fan, Rufus and Yankee had been instrumental in the killing of some "two" quail. It ought to have been 800. We suppose the written number, 800, was taken by the type setter for two. Once on a time a man in England wrote to his correspondent in India for "too" monkeys; he meant two, but he did not spell very well and had forgotten to cross his t, so he received 100 monkeys of assorted kinds and sizes.

**JEFF.**—Horace Smith, Esq., kindly sends us the following, as to the pedigree of Jeff, which a correspondent asks for:

"The setter dog Jeff I sold to Capt. R. L. Ogden, of San Francisco, Cal., was by Fritz, an extra fine Gordon setter, now owned by Edward Howe, Esq., president of Princeton Bank, N. J.; and the bitch from which Jeff was bred was Nell, the property of J. Q. A. Packer, Esq., also of Princeton, N. J. Nell was known far and wide as one of the very best in all that section of the country. Jeff and Nell are both dead."

**DETROIT BENCH SHOW.**—A bench show of dogs will be held at Detroit, Jan. 8, 9, 10 and 11, under the superintendence of Chas. Lincoln.

—In our next number we will give the names of the pointers and setters prize winners at the Birmingham dog show.

**BALTIMORE DOG SHOW FOR 1878.**—The Baltimore dog show will be held in April, 1878, commencing on the 23d and continuing 24th, 25th and 26th. It will be held under the auspices of the Baltimore Kennel Club.

**WANTED A DEER HOUND.**—The owner of the two English imported setters, advertised in the *FOREST AND STREAM* of the 6th inst., is willing to exchange one of them for a fine deer hound. Address C. M. DAUPHIN, Dauphin Co., Penn.

—The Montclair Hunt Club had a successful coursing run on Christmas Day, the hares being caught about six miles from the rendezvous.

**CARRIE.**—Jesse Sherwood, (Edina, Mo.) has sold to W. T. Irwin, of Topeka, Kansas, his setter bitch, "Carrie." Carrie was bred by E. F. Stoddard, of Dayton, Ohio, sire, his imported "Mar," (Minx-Plunkett); dam, his imported "Dutchess." She is dam of "Carrie II," winner in the "Hampton Field trials," 1877. Carrie was a prize winner at St. Louis, 1876. She is in whelp to Sherwood Champion, Gordon "Rupert." He won 1st prize at Birmingham, Eng., and also at New York and St. Louis, 1877. Also 1st as best stock dog at St. Louis. Carrie will be a valuable addition to Mr. Irwin's kennel.

**NAME CLAIMED.**—*Newton, Kans.*—I claim the name of Cronin for my bear-eyed, lop-eared, big-nosed, white-and-liver colored pointer pup, by Ned (Dickensheets), out of Fan (Lowe). A. D. KNOWLTON.

—The Meadville Dog, Poultry and Pigeon Pet Stock Association, will hold their first show on the 25th, 26th, 27th, and 29th of Jan., 1878, at Meadville, Pa. Premium lists will be furnished on application to the corresponding secretary, W. A. Logan.

**A RETRIEVING BABY.**—*Editor Forest and Stream and Rod and Gun.*—Last summer I amused myself with breaking a young setter dog, to the great edification of my eldest, a youth of five years, who took a lively interest in my proceedings. Sitting in my room one afternoon, I heard the words I used in training coming from the nursery, and thinking Master Charles was spoiling the dog, stepped to the door to see what he was about. The dog was not there, but as I entered the room the baby, two years old, was retrieving the towel, which she had found in a corner where it had been stowed by Charlie. Eddie, the second boy, was still hunting "dead bird," not having observed the baby "find." I discovered that Charles was in the habit of training the children, and had them under quite good command, having broken them to stand, down charge and retrieve. And now some wicked slanderer asserts that I am so fond of dog-breaking that I even train my children according to ducks. E. S.

**AN OLD DOG'S POINT.**—*Hanover, Pa., Dec. 6.*—The sportsmen here own in many instances excellent dogs, which, although not claiming any imported lineage, would make many of the

champion blue bloods and natives look to their laurels. While upon this subject I cannot resist mentioning a double-nosed setter, owned by Mr. Jacob Trone of this place. Although now about fifteen years old, stiff and deaf as a post, yet his nose appears to be as keen as ever, and he finds and stands birds almost every day for the son of his owner, who is now serving his apprenticeship at the sport of which his father has been so many years an earnest follower. "Tobe" is the fullest double-nosed dog I have ever seen; the nostrils not only standing so far apart that a finger can easily be placed between them, but the two front teeth of his upper jaw are separated, giving him the appearance of having received an injury. Indeed, often have I heard a farmer of the neighborhood, in Pennsylvania Dutch, inquire—"Ei, vass füll de hund?" (What is the matter with your dog?) And it was difficult to convince him that it was natural I could fill columns with incidents in his career, noteworthy and interesting to every hunter. In pursuit of jack snipe, several years since, "Tobe" suddenly came to a stand at the edge of a pond of water, collected in an abandoned stone quarry. Advancing to flush the game, a number of robins rose from in front of the dog. His owner, angered at the supposed want of good judgment of the dog, administered a severe chastisement, and told him to "hie on," but "Tobe" wouldn't "hie" worth a cent. On the contrary, assumed again the rigid position of the well-trained dog at point, and on walking to the opposite side of the pond (fully twenty feet from the dog), two *Wilson's* were flushed and killed. Never since has "Tobe" been whipped for standing, for if robins or anything else flew up before his point there was a certainty of game being there also. BRUSH.

## CLASSIFICATIONS AT BENCH SHOWS.

MANGORIKE, RICHMOND COUNTY, Va., Dec. 15, 1877.

EDITOR *FOREST AND STREAM*:

The ideas of "Y. A. R." in relation to competition between imported and native dogs at bench shows, as expressed in F. and S., of Nov. 23, would probably be the same in regard to competition in the field. Your correspondent, "Y. A. R.," says that "all dogs bred in America and whelped here should compete in native classes." This will soon bring out the fact and dispose of the vexatiously disputed question as to whether the importation of setters is an improvement or the contrary, by bringing the produce of importers into direct competition with the natives; and that, "where classes are formed for imported dogs they should be open only to such animals as are imported." As I understand "Y. A. R.," his suggestion is to drop from the classes of imported dogs the "progeny of the first generation," and he instances the catalogues of the Westminster Kennel Club as being one of the best, but open to the change suggested as an improvement. If I breed imported dogs, will competition between them and their progeny show the relative merits of native and imported dogs? I should say not. But as the ancestors of all our sporting dogs were imported, the nice question comes as to just what degree of relationship marks the line of demarcation, if such there be, between native and the "progeny of imported" dogs.

I have been shooting this season over two dogs that might be classified separately. The sire of one (Guy) was an imported Crystal Palace prize winner, and Guy is the sire of the other (Corla II). Now, Guy might perhaps be classified as "progeny of the first generation," while Corla II should be classified as native. Each possesses the same temperament and disposition, nose, courage, gentleness, coat, color, etc. In fact, mutual qualities for both bench and field, differing only in one being a little more thoroughly broken than the other. One of these dogs competing with the other, either on the bench or in the field, would afford no just comparison of the relative merits of the classes they might respectively represent. It is true that Guy's dam (Corra) is not imported, but is a thoroughbred English setter, as is shown so well by her characteristic head, which answers in every particular to the standard points of the breed. Now, Mr. Editor, I would reverse your remark made in connection with "Y. A. R.'s" letter, and say that, so far at least as my own dogs are concerned, there is no reason why native setters should not compete with those classified as imported. But I would apply this remark solely to bench shows, and not to field trials. I do not think that the best dogs of this country are in any respects inferior to the best of Great Britain, and therefore the best of the world, in desirable field qualities; but I do most emphatically declare that there is a vast difference in the development by training of those qualities as between America and Great Britain. In the latter country, probably, a very large majority of the well-bred sporting dogs are well-broken; but in America a very large majority of the same class of dogs are not well-broken. By the term well-broken I mean something more than standing game and retrieving, and the fact that my statement above is indisputably correct is well known to those sportsmen who may have shot in different sections of both countries. I know that by saying this over my own name I am likely to bring a storm about my ears, especially from many personal friends, owners of fine dogs, and scoffers at what they term my "English ideas." Yet many of them to whom a dog is valued in proportion to the game bagged can only know the difference between a thoroughly broken dog and one that is not by the experience of repeatedly shooting over each, and measuring them by their own standard of "the bag." As a case in point, I would instance a late occurrence in my own experience with a dog, which I daily endeavored to teach in the field. I took the time that a friend thought might be more profitably, and certainly more enjoyably, spent in hurrying on in search of more game. I showed this friend that by spending half the season in assiduous dog-breaking I can count a better bag for the whole season than could be made over half-broken dogs of greater experience. Not intending to write upon dog-breaking at length, I only wish to give me hints as to why I should consider the competition between English and American dogs (imported and native), less favoring one over the other on the bench than in the field. And the difference in the field would not be shown at a public trial for which the dogs have been specially trained, as it would be shown to a sportsman shooting over the respective dogs and killing a variety of game. In conclusion, I would ask why the distinction made in classification between native and imported might have been made a few years ago, but not now? EVERETT SMITH.

[In reply to our correspondent, whose interesting comments we publish above, we beg to state that the suggestion made by us as to the distinction made in classification between "native and imported, which might have been made a few years ago, but not now," refers to their progeny. To-day we are rather given, so we think in bench shows, into making too many classifications, from whence arises confusion. There is enough infusion of the best English blood now in our kennels in 1877, and there will be in 1878, for us to tip directly the progeny of English stock with native; or, as "Y. A. R." has it, "bringing the produce of importers into direct competition with natives. Even eight years ago this would not have been possible, but to-day it certainly is.—Ed.]

## Sea and River Fishing.

### FISH IN SEASON IN DECEMBER.

Black Bass, *Micropterus salmoides*; Yellow Perch, *Perca flavescens*.  
M. nigricans. Sen. Bass, *Sciaenops ocellatus*.  
Pike or Pickerel, *Esox lucius*. White Perch, *Morone americana*.

**FISH IN MARKET.**—Bass, 25 cents a pound; smelts, 15 to 20; bluefish, 15; salmon, 30; mackerel, 25; shad, southern, \$1; green turtle, 18 cents; terraken, \$10 to \$36 a dozen; halibut, 18 cents a pound; haddock, 8; cod, 5 to 6; flanders, 10; lobsters, 10 each; sheep's head, 25; English turbot, \$1 a pound; scollops, \$1 a gallon; soft clams, 60 cents a hundred; white fish, 18 cents a pound. A very fine lot of red snappers from Florida are in the market. Turtle, owing to the pestal season, are scarce.

**SHAD IN THE HUDSON ALL THE YEAR ROUND.**—Mr. A. S. Briggs, of Tarrytown, informs us that two weeks ago he caught two roe-shad, weighing  $3\frac{1}{2}$  and  $4\frac{1}{2}$  pounds. Mr. Briggs says that there is not a month in the year, save August, that he cannot catch shad in the Hudson. In August he has no nets. [This information is quite important, and is worthy of future study. Ed.]

**CODFISHING NEAR NEW YORK.**—Last Sunday the Seth Low made her sixth trip this winter out of New York with a party of fishermen intent on cod. Two facts are evident here: that there is no winter this December, and that cod are in abundance. No end of cod, averaging six pounds, were caught.

**THE HERRING FISHERY.**—A great scarcity of herring is reported on the north coast of Newfoundland, owing to moderate weather and southerly winds. The indications are that the fishery will prove a failure.

**MOVEMENTS OF THE FISHING FLEET.**—The schooner Ada K. Terry arrived on Monday from Grand Menan, with a cargo of frozen herring, being the first receipt for the season, and ahead of the call for baiting purposes. On Tuesday there was another arrival in the same line, the schooner Smuggler, Capt. McLane. These vessels are about a week ahead of the first arrivals last year. The number of Bank arrivals the past week has been small. The Chester R. Lawrence arrived on Friday with about 25,000 pounds halibut. The Edward Grover arrived with 40,000 pounds halibut on Tuesday.

Schooner M. H. Perkins arrived Wednesday, with about 6,000 pounds halibut. The other arrivals for the week have been confined to the Shore and Georges fleets. The boat and dory fishermen have continued to meet with good success, and prices have been a trifle above the average. The number of Georges arrivals has been four, bringing 36,000 pounds codfish.—*Cape Ann Advertiser*, Dec. 21.

**THE MACKEREL FISHERY.**—The Boston Fish Bureau reports the mackerel inspection of that city for the present year at 20,139 pounds, against 36,384 pounds last year.

—Miss Sara J. McBride, so well known to all devotees of angling as a lady skilled in the manufacture of flies, has paid us a visit. Among the many fishing implements at the Centennial in group V, none excited greater attention than Miss McBride's show cases, in which her flies were exhibited. The lady was honored with a Centennial medal. Miss McBride just returned from a visit to England, Ireland and Scotland, where she paid particular attention to the many varieties of flies made abroad. As we may consider Miss McBride as an authority, she assures us that we can much more than hold our own in this country in the delicate art of fly making, for that English flies are generally clumsy as compared with those of our best makers. In Redditch, England, where the best hooks are made, Miss McBride devoted some months personally to the manufacture of hooks to be used in her business. Miss McBride intends establishing an atelier for flies and angling material in New York, and we shall shortly announce her exact place of business. This lady's work is too well known to all fishermen in the country to require any laudatory comments.

**ENGLISH FISH CULTURE.**—The fish-culturists of England are making strenuous efforts to improve declining or nearly ruined fisheries, and render them of value as food producers. The *London Times* in a recent article says: "A large and very healthy consignment of salmon and trout eggs from the Rhine, Lucerne and Geneva have lately been received in London. The salmon eggs were all gathered from Rhine fish, collected and packed under the advice of Herr Hanck, of the famous fish culture establishment at Huningue. The process of packing is described as very simple. The eggs are counted into thousands. They are then carefully inclosed in gauze and lightly packed in some well cleaned soft moss. The boxes are tied up all together in handy parcels and sent off to their destination, great care being taken in transit to prevent the eggs from being shaken. In the present instance the ova arrived in fine condition."

**HOW THE COSSACKS CATCH STURGEON.**—In that most interesting book of travel, "A Ride to Khiva," Capt. Burnaby tells us of the sterlet, a fish caught in the Volga, and considered by the Russian *bon vivants* a great delicacy:

"The bones are of a very glutinous nature and can be masticated, while the taste of a sterlet is something between that of a barbel and a perch, the muddy flavor of the former predominating. However, they are an expensive luxury, as to be in perfection for the table they should be taken out of the water alive and put at once into the cooking pot. In most of the restaurants in the capital the proprietors keep sterlet alive in small ponds. The intending purchaser goes there to select a fish for his dinner, the owner of the restaurant dragging it out of the water with a landing-net for his customer's inspection. 'The Cossacks of the Ural have a singular way of catching sturgeon,' observed my companion, 'and it is a method, I believe, unknown in any other part of Europe. At certain times in the winter the men assemble in large numbers by the side of the river, and, dismounting

from their horses, cut a deep breach across the stream from one of its banks to the other. They then lower their nets into the water and arrange them so as to block up the entire channel, when, getting on their horses, they will ride for seven or eight miles along the banks. They then form a line of horsemen, reaching from shore to shore, and gallop down in the direction of the nets. The fish hearing the clatter of a thousand hoofs, swim away from the sound, and dart like lightning in the opposite direction. Here their course is at once averted, and they become entangled in the trammels. The quantity of sturgeon is at times so large that the sheer weight of the fish is sufficient to force a passage through the nets, a blank day being the result to the fishermen."

—The waters of the South Side Club of Long Island are hereafter to be stocked with fish hatched on the grounds. Hatching-houses have been erected, and fish are being striped and the eggs prepared for artificial hatching.

## Game Bag and Gun.

### GAME NOW IN SEASON.

|  |   |
|--|---|
| Moose, <i>Alces melchis</i> .                        | Pinnated grouse or prairie chicken                  |
| Caribou, <i>Tarandus rangifer</i> .                  | <i>Cupidonia cupido</i> .                           |
| Elk or wapiti, <i>Cervus canadensis</i> .            | Ruffed grouse or pheasant, <i>Bonasa umbellus</i> . |
| Red or Virginia deer, <i>Capreolus virginianus</i> . | Quail or partridge, <i>Ortyx virginianus</i> .      |
| Squirrels, red, black and gray.                      | Woodcock, <i>Philohela Minor</i> .                  |
| Hares, brown and gray.                               |   |
| Wild turkeys, <i>Meleagris gallopavo</i> .           |   |

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets &c., coming under the group *Limacoles*, or Shore Birds.

IN New York State December is a close season for deer. Deer shooting is permitted only during the months of September, October and November. Sale of venison is permitted until January 1st, and not after.

VERMONT—*Ferrisburgh*, Dec. 21.—Grouse are plenty, and on these and the little foxes we have to rely for sport.

VERD MONT.

A SHOOTING CLUB AT BLUE POINT.—Within an easy journey of the metropolis there are few places which offer greater attractions than Blue Point, Long Island. *Imprimis*, there are those famous Blue Point oysters which have no rivals in the bivalve world. Blue Point in summer has good fishing, there being found in the waters bluefish and sheephead; but just now it is a good place for ducks, as a great many varieties, with geese, frequent the locality. In addition to other attractions is the nearness of the location to the city, being within two hours' ride by the Long Island Railroad. Under the management of Mr. Horace Howard, who owns a large extent of valuable property in the vicinity of Blue Point, a select club of gentlemen is now forming for the purpose of shooting there. Among others are—John Avery, Dr. Geo. H. Glenney, John C. Dowling and Chas. McDonald. Gentlemen wishing to join the club should address, for particulars, Mr. H. Howard, Blue Point, Long Island.

PENNSYLVANIA—*Petroleum Centre*, Dec. 20.—Mr. A. G. Lewis, a member of the sportsmen's club of this place, shot last week a white squirrel, weight 23 ozs., length 22½ inches. It was milk-white with black eyes, so it was not an albino. Good bags of ruffed grouse are made daily around here, and I have noticed that by far the greater number are cock birds. The close season for rabbits commenced Dec. 15, but I fear that the boys around here will not pay much attention to it, as we all know that rabbits are at their best in December and January, and they are far too numerous for the farmer's comfort. In deep snows they do considerable damage to young trees; the time for shooting them ought to be extended to January 15. Such is the opinion of our club, and we have over fifty members.

BLUE ROCK.

PHILADELPHIA, Dec. 15.—The continued mild and genial weather has added greatly to the comfort and pleasure of our sportsmen, and many are still "afeld" in quest of game. The bags of quails made in our own State have been remarkably light. Those made in New Jersey and Maryland have rendered a better showing, yet compare very poorly with the yield of the past several seasons. This marked scarcity of birds is properly attributed to the severity of last winter. The largest bag of quails reported for one day is sixty-five to two guns—Messrs. Gwyn and Hudson. Woodcock have been unusually plentiful in Maryland this fall, as the following bags prove: W. Greenwood and C. Lipman, two days, 74 woodcock; E. Griffith, one day, 37 woodcock; C. Alberton, one day, 36 woodcock; J. Todd, three days, 114 woodcock; R. Woods, three days, 90 woodcock. Other bags equally good were reported. Very few ducks have been killed on the Chesapeake waters during the past two weeks—the birds for some unaccountable reason have disappeared, probably migrated further south. It was observed that the flight of canvas-backs and red-heads this year was unexceptionably large. The desertion is therefore more apparent.

D.

TENNESSEE—*Savannah*, Nov. 28.—Quails are more numerous this fall than they have been for several years. Squirrels have made their appearance in large numbers, attracted by the extraordinary quantities of mast. Ducks and geese have not arrived yet, being delayed, I suppose, by the unusual warmth of the season. Turkeys are reported plentiful. There are no snipe to be seen in this vicinity, and only a very few woodcock. I have not seen a single specimen of either this fall.

WILL.

LOUISIANA—*Bayou Teche*, Dec. 1.—Jack snipe are along the marshes back of the Teche. They are shipped by the thousands each week to New Orleans. One steamer, Mary Lewis, took on board several of these birds between St. Martinsville and Franklin. Woodcock have not yet arrived, though it is expected that this cold snap will drive them here. I was told that last year a boy killed 34 woodcock in one afternoon. Deer and bears are on the smaller bayous. Green-wing teal are numerous.

ARROW.

MISSISSIPPI—*Corinth*, Dec. 19.—Weather very cold for this season; no ducks in yet; have bagged a good many quails; several turkeys have been shot by sportsmen from here.

GUYON.

CHRISTMAS TURKEYS, CHRAP!—There is no excuse for the Texan going without a good Christmas dinner. We don't know just how many mouths one of those gobblers could fill, but at the most moderate estimation, even he who does not follow in the footsteps of the abstemious Train, might feel thankfully full on a five cent cut from a twenty-two and a half cent turkey. That's just what they sell for in San Antonio, according to our correspondent, Arrow, who writes under date of Dec. 10:

To-day mine host, Menger, bought a large buck for \$2.25 and a lot of fine deer—four bucks and a doe—for \$8. He also purchased thirty wild turkeys for 22½ cents apiece. The hunter who sold them had two wagon loads of wild turkeys; in all one hundred and eleven. Last week he sold sixty-five of the same kind. These are killed in Freo County, about 70 miles from here. Deer are abundant there.

IOWA—*Mount Pleasant*, Dec. 21.—Our shooting has been poor here on account of the constant wet and muddy weather. Quail plenty, and more chickens than usual.

MONTANA—*Fort Shaw*, Dec. 15.—We have been deprived of much of our customary sport during the past season, on account of the scarcity of our favorites—the grouse families—which have not been nearly so plentiful as usual, although there seemed to be a fair stock in the spring. I think that the late snows we had interfered with their nesting, and either drove the pinnated fellows to the foot hills or destroyed their nests entirely, as they were not to be found on their usual haunts—the grainfields. However, we got partial satisfaction out of geese and mallard duck, which have been fairly plentiful, and I and my hunting "pard" have made several very nice bags, as have also a number of other parties.

CALIFORNIA—*Lake County*.—Lake County is well-known to sportsmen for its abundance of game and fish. In fact, in this particular it stands almost without a rival on the coast. Deer abound in the hills and mountains in all portions of the county, and rabbits and hares are plentiful. Grizzlies are very scarce, but other varieties of bear are quite numerous in certain sections of the county. Canvas-back, mallard, teal, and other ducks are very plentiful on the lake in the fall and winter, and wild geese resort here every season. Quail are abundant, and snipe are often found. Grouse and mountain quail are also found in many parts of the county, especially among the fir-forests of the northern section. Very many kinds of fish may be found in Clear Lake, such as perch, pike, silver-side, blackfish and lake trout, and the streams flowing from the mountains have plenty of brook trout. The fish from Clear Lake run up all the tributary streams in the spring in vast numbers, and during some seasons the immense quantities that may be seen and killed in some of these streams is incredible to those who have never seen them. There are no salmon in Clear Lake, but in the northern part of the county, about the head waters of El River, they are plentiful. The latter perch is only found in the lakes, and only bites during the part of April, and in May and June; but the sport during that period is as fine as fishermen can wish.—*Lake County Bee*.

CANVAS-BACK SPORTING CLUB.—San Francisco has a new sportsmen's club, which has taken unto itself the above name. For its shooting expeditions the club has provided a floating club-house, built upon a scow sixty feet long and thirty feet wide; has fitted it up with sails, and provided a small tug to navigate the bay, river and sloughs when the wind fails. They have fitted it up with sleeping-rooms, a parlor, kitchen and dining-room, and all the convenience of a home afloat. The scow is also equipped with boats, decoys and other apparatus. It is the intention of the club to secure some extensive shooting grounds for their exclusive use. The membership of the club is limited to twenty. Among those already enrolled are Ben Hollanday, Jr., J. B. Wattles, E. F. Hall and Jennings S. Cox, brokers; R. L. Ogden, capitalist; H. K. Moore, lawyer; Virgil Williams, artist; C. H. Maddox, Sidney Smith, A. L. Tubbs, Charles Kneading, Alexander Weed, A. W. Forbes and Chas. Josselyn. Ben. Hollanday has been elected president, and Charles Josselyn secretary of the club.

A FINE SPORTING FARM.—It will be remembered that Mr. E. S. Wannmaker went to Virginia some two months ago to break dogs on game. He has recently returned, and here is the account he renders of himself:

HOBOKEN, N. J., Dec. 15, 1877.

The farm of our friends at Fort Detmold is well calculated for a sporting box, and affords every possible advantage by way of propagating and keeping game till wanted. Two thousand acres may be leased (the shooting privileges) for a bottle or two of whisky; and birds can be found sufficient in numbers at opening of the season (without stocking) to keep busy ten guns for thirty days.

There are plenty of deer and turkey in the mountains, and the climate is perfectly delightful and cool in autumn.

By a little attention paid to sowing coarse strong grass and allowing it to remain uncut, will render cover sufficient to keep the birds in the open entirely; and the wood is so thin that shooting therein is very easy. We made fair bags of quail daily, shot three ruffed grouse in wood near house, and they, the latter, are quite plentiful about one mile from the house.

Ducks were just putting in an appearance when I left.

In parts of three days' shooting we bagged two deer and five turkeys in the Shenandoah mountains.

A party of Englishmen, camped about seven miles from us, twenty in number, with forty dogs, killed twenty-one deer in five days.

We saw about 100 turkeys, but were too late for good shooting, as we had no dogs to run and scatter them.

Our shooting was from blinds along fences bordering buckwheat stubble, and the birds were very wary, having been much shot at.

Very truly yours,

E. S. WANNMAKER.

THE TIGHT SHELL.—Mr. M. Hastings, of St. Louis, has executed an exceedingly clever picture, which he entitles "The Tight Shell." It tells its own story. There fly the ducks; there stands the dog ready to retrieve the birds, and what does the sportsman do? Why he fumbles and bothers, trying to make a cussed shell, whose circumference must be fully that of a quart measure, chamber into an ordinarily sized gun barrel. Under such circumstances a pious sportsman invariably repeats "Now I lay me down to sleep," religious recitations being peculiarly fitting for the occasion. All we can say of the original of the picture is that Mr. Budd's countenance is that of a hero under the most trying of all ordeals. We think we have seen a similar picture, or rather one on the same topic, the property of Mr. Zimmerman, of St. Paul's.

CAPTAIN BOGARDUS.—Captain Bogardus has just completed a week's engagement at the Olympic theatre, which was a most successful debut of this leading shot, there having been a full house in attendance every night. During the week Captain Bogardus shot at 232 glass balls, missing four. The great feat of the double shot was executed, the Captain springing his own traps. Captain Bogardus shoots this week on the east side, and is actively preparing for the great match, which is to take place at Gilmore's Garden on January 4th. After the match, Captain Bogardus will again appear at the Olympic.

SHOOTING CHALLENGES.—Dr. W. F. Carver, whose shooting has excited considerable attention in San Francisco, contemplates an Eastern tour, and has sent us several important challenges, which we shall publish next week. Captain Bogardus has already signified his intention of accepting the challenge in question.

—On Friday last, Mr. Ira A. Paine made a public record before an audience of breaking twenty-three glass balls in forty-seven seconds, the balls being thrown from one hand by Mr. Paine, and shot at with a Colt's army revolver held in the other hand. The balls were thrown at different elevations and velocities, no two balls being thrown alike. Mr. Paine remains at the London this week.

ABE. KLEIMAN'S GUN.—In reply to a correspondent, Dec. 13, we incorrectly stated that Mr. Abe. Kleiman used an Abbey gun. In justice to Messrs. Schöverling & Daly, the well-known gun makers of this city, whose gun Mr. Kleiman shoots, we hasten to correct the error and cheerfully publish the following letter:

MESSRS. SCHÖVERLING & DALY, New York: Over one year ago I gave the F. G. Abbey gun I was shooting to F. P. Taylor, Chicago, for one of your Daly guns. I do not want any better gun. It won fourteen prizes at the Nashville Tournament this fall. Always expect to shoot a Daly gun. Mine is not for sale. Yours truly, ABE. KLEIMAN.

BURSTING OF A SHELL IN PRIMING.—Mr. E. J. Crane, of Kennebunk, Maine, had the fingers of his left hand badly lacerated by the explosion of a loaded shell which he was priming. He had the shell up to his face, levelling the primer preparatory to pressing it home, when it burst on the side opposite his face.

Z. B. C.

HOW TO SHOOT LOONS.—A Minnesota correspondent, Mr. J. N. Sanford, writes us from Elbow Lake, Grant County, and gives the following digest of his experience in shooting loons. He says:

"The loon (great northern diver) seems to some of your correspondents to bear a charmed life. I have hardly ever failed killing them in the water with shot; have killed at least six or eight with a common No. 10-bore shot-gun, and one or two with a Parker (same bore). In the spring and early summer they can be called near enough by imitating their lowest notes. If the imitation is poor they will come, provided the hunter gets behind grass or screen."

SCHUYLER, HARTLEY & GRAHAM.—Accustomed as we should be to catch the salient features of almost all things, and to represent them intelligibly to the popular view, in describing Messrs. Schuyler, Hartley & Graham's exhibition for the holidays, we find much greater difficulties than usual. Can any one fancy an establishment where a government could go to and say, "Furnish me with a hundred thousand or so of rifles, canons, Gatlin guns, and ammunition, with sidearms, uniforms, everything in fact an army would want?" Such demands Messrs. Schuyler, Hartley & Graham could promptly meet. Now, on the other hand, suppose a dainty lady wanted to furnish her drawing-room with the most elegant of bronzes, including clocks, vases, china, Sevres, or Fayence, or majolica, or her boudoir with mirrors, or her toilette table with combs and brushes, the most delicate soaps, the most exquisite perfumery—at Messrs. Schuyler, Hartley & Graham's the most fastidious of her sex could not fail to find all she required. To catalogue simply all one can see at this wonderful establishment in Maiden Lane, would be absolutely bewildering. Almost every thing imaginable in the line of fancy goods is offered for sale. Here are beautiful leather goods, with jewelry of exquisite design, watches of the most celebrated makers, with ivory toilette brushes and combs fit to rival out the tresses of Venus. You go from floor to floor, and are amazed at the multitude of goods and their variety. Do you want a gun from \$5 up to as many hundreds?—here may be found every kind of fowling-piece made by either leading English makers or our native manufacturers. As to rifles, Messrs. Schuyler, Hartley & Graham exhibit on their racks every destructive arm, from the one which made the Russian quail at Plevna to a squirrel rifle. Here are all the paraphernalia used by Masons, Knight Templars and Odd Fellows. As to uniforms, Messrs. S. H. & G. being manufacturers, can furnish a Major General's chapeau or a private's chevrons. When we visited this establishment, it was thronged with ladies making their purchases. Perhaps a similar grand display of goods cannot be found in the world outside of Maiden Lane, New York.

ALL THE CLEVER GUN-MAKERS ARE NOT OF TO-DAY.—AN OLD BREECH-LOADING FOWLING-PIECE.—Some months ago a correspondent informed us of a breech-loader a century old, belonging to those leading gun and rifle manufacturers, Messrs. Williams & Powell, of Liverpool, England. On addressing Messrs. Williams & Powell in regard to this arm, they have sent us an interesting description of the same. Reading this communication, and remembering the many hot

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION AND STUDY OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 27, 1877.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

### A NEW YEAR'S GREETING.

Almost five years old! Why that is both young and old for a newspaper. Young are we then in heart as 1878 comes on us, and old are we only in experience. It is not out of place nor selfish at this moment for us to speak of ourselves, for the success of the FOREST AND STREAM AND ROD AND GUN is due to the hearty support we have received from every part of the country. In thinking then of ourselves, we naturally revert with gratitude to our innumerable friends, and to each and all we wish a Happy New Year. That auxiliary verb "may," we know is rather lavishly employed about this time of the year, "May you be prosperous," "May you be rich," are all phrases of speech much in vogue. Let us add ours: "May our readers in 1878 enjoy good health and be of a contented spirit, and when 1879 comes may all of you be united with us of the FOREST AND STREAM AND ROD AND GUN by the same ties of friendship, respect and good fellowship as now undoubtedly exist."

—Mr. James Brady has been our mailing agent ever since this paper has been in existence. Of course no human being is infallible, but we fancy that Mr. Brady makes fewer mistakes than almost anybody else. As a recompense to the boys in his employ, Mr. Brady presents every one this Christmas with a new suit of clothes.

—We are pleased to acknowledge a present from Mr. Alfred P. Jones, of Homosassa, Florida, of a Christmas box of grape fruit, a large and delicious variety of the citron family, which only needs to be eaten to be appreciated. Mr. Jones' winter guests are enjoying themselves at his quarters.

—THE FOREST AND STREAM AND ROD AND GUN makes an admirable New Year gift for a boy. It is a pleasure which is renewed fifty-two times in the year. We sell a \$60 paper for \$4.

FOREST AND STREAM may be allowed occasionally to indulge in a little self-congratulation on its enterprise and success in certain matters. We aim to publish, not merely a sporting paper in the ordinary acceptance of the term, but rather a journal which, devoted in the main, it is true, to out-door life, shall yet contain a large amount of information on various topics which could not be elsewhere obtained. The great prominence given in these columns to Natural History, Fish Culture and the Garden, and the interest taken in these departments by our readers, show that FOREST AND STREAM occupies in no small degree the position of a public educator. That we strive to fulfill the responsibilities of this office as its importance demands, the rich and varied character of the material to be found in our columns clearly shows. With what measure of success our efforts are crowned others must judge.

We have been led to those reflections by noticing that FOREST AND STREAM was the first publication to print Dr. Marsh's Nashville Address, the first number of which appeared in our columns immediately after its delivery. Of course there was a universal desire among scientific men to see this important paper, and as soon as it could be obtained the London *Nature* followed in our footsteps, and later, in its November number, the *American Journal of Science and Arts* gave the whole address, while we learn now that it is soon to be printed again by another scientific monthly. We merely mention these facts in order that the readers of FOREST AND STREAM may understand how anxiously we strive to bring before them at once whatever new or interesting matter appears in scientific circles or elsewhere.

Of the importance and value of the address to which we refer it is unnecessary to speak at length. We only quote the language of one of our most learned and most highly respected biologists, when we say that no scientific document which has ever appeared in this country contains an equal amount of new and important information. It is not alone because Prof. Marsh's Address is replete with novel facts, is a complete summary of all that has yet been done in this country in vertebrate paleontology, and traces in the most conclusive style the genealogy of many groups of animals that it is of value; the announcement of the various laws which the author has deduced from his studies is of still greater importance, and their establishment marks an epoch in science. The address, as a whole, is a masterpiece, which adds another laurel to the wreath which already encircles the brow of America's ablest paleontologist.

THE BEARS AND THE MEN.—We rather give a preference to the bears in a certain series of rough-and-tumble performances, which have lately taken place in New York, between two bears and Bauer and Regnier, the wrestlers. Now, if the bears had only a fair chance, the wrestlers would certainly get the worst of it, but the poor brutes, with a nose-ring and a rope, have not much fair play shown them. Such sports we deem essentially coarse and degrading, and, smacking as they do of the bear garden, all we have to say is that they pervert good taste and decency.

OUR THANKS.—We thank the clubs in Massachusetts and Michigan for their liberal subscriptions to our paper. In the marriage of the FOREST AND STREAM AND ROD AND GUN, we have not lost a single one of our friends or correspondents. Our contributors have ever remained steadfast. The only trouble is that at times our columns will not contain all the excellent matter furnished us. In a gill measure you can't pour a quart. Still, in due season, all contributed articles see the light. But just now, had we the bulk of the *London Field* a good many capital articles would have to be left over.

THE AMERICAN MUSEUM OF NATURAL HISTORY.—The opening of the new Museum on Manhattan Square, this city, last Saturday, was an event of more than local or transient interest. The opening ceremonies were participated in by Pres. Eliot, of Harvard; Prof. O. C. Marsh, President of the American Association for the Advancement of Science; and the President of the United States. The presence of a large number of gentlemen eminent in learning and science, and representing the important scientific and educational institutions of the country was significant of the national importance of the occasion. The plan of the Museum is national in scope, and if the conception of its projections be perfected, the American Museum in New York will be to America what the British Museum in London is to England. We shall present in a future numbersome details of that portion already completed, and the structure as it will be when completed a generation hence.

SOUTH CAROLINA ORANGES.—We are enjoying a box of large and luscious oranges from the grove of Chas. G. Kendall, Esq., the proprietor of Palmetto Island, near Port Royal, South Carolina. They are exceptionally fine fruit, and superior to most of the oranges set to market from the Florida groves. From repeated annual tests and examination of the Sea Island region, we feel fully assured that orange culture can be made even more profitable there than in Florida, on account of its ready access to several markets. It has direct steam communication constantly with New York, and the voyage being much shorter the fruit can be forwarded in much better condition, and need not be picked so green. Mr. Kendall has selected his seeds and cuttings with great care, so that the quality of his fruit cannot be greatly improved. He invites the attention of orange growers to his groves.

GENTLEMEN'S GOODS, LORD & TAYLOR.—A great many of our friends residing in distant portions of the country, may be in want of what are generally known as gentlemen's furnishing goods. This category is a numerous one, it includes all a man wants either to make himself stylish with or to keep himself warm. It includes a Cardigan jacket to wear under a shooting suit, or a white satin tie, the sportsman would want to be married in. Let then all who require such goods, go in person or write to our friends Messrs. Lord & Taylor, of 901 Broadway and 283 Grand St. If luxuriously inclined, Lord & Taylor have dressing-gowns and smoking-jackets, with railroad rugs, scarfs, pins, fancy ties, stockings, gloves, suspenders, shirts of every kind, make and color. No fuller line of goods is kept anywhere in the country, and all tastes and purses can be exactly suited at Messrs. Lord & Taylor. The house ranks among the first in New York, having been in successful existence for the last thirty years.

### THE COUNTRY.

A weekly journal, devoted to the Kennel, Shooting, Fishing, Fox Hunting, Archery and other outdoor sports. Has also departments treating of Natural History, The Garden and Poultry, Pigeons and Pets. Edited by Wm. M. Tileston, 1st associate editor of FOREST AND STREAM. Subscription price, \$3 per year. Specimen copies free. Address,

"THE COUNTRY PUBLISHING ASS'N,"  
33 Murray street, New York.—[Ado.]

### GAME PROTECTION.

FORM OF TRESPASS NOTICE.—We print this as a very good form of notice to trespassers. It has been sent us by a Virginia friend:

#### NOTICE.

All persons are warned not to hunt, fish, trap or shoot upon the farm known as Conway in the County of Spotsylvania, Virginia. They are also prohibited from making a passway through the plantation with vehicle, horseback or on foot. This notice is for all, irrespective of color, race or previous condition. Those wishing to pass through the farm will do so only by special permission. Gentlemen wishing to hunt, as sportsmen, will have the necessary permission granted by making application at the residence of the undersigned. This notice will be posted at the County Court House and in three other public places, as the law directs, and any and all trespassers will be dealt with to the full extent of the law, upon every occasion, without fear, favor or affection.

June 1st, 1877.

R. M. C.

### NATIONAL ACCLIMATIZATION.

CHICAGO, Illinois.

Mr. Editor—I wish, if you will give me the kind permission, to inquire through your columns of all lovers of nature throughout America, if the time has not arrived for the establishment of acclimatization societies in all our leading centres of wealth and intelligence, from Philadelphia to San Francisco, and from Chicago to New Orleans? I mean societies for the introduction of any useful or ornamental animal from abroad, calculated either to enhance or add to the pleasure and adornment of our country. I for one have been long looking for the coming of the good time, and think we now have the taste, culture and means to make a general start. The most obvious attraction on which to begin would be the singing birds of Western and Northern Europe. How delightful the thought to awaken and re-tune in America the voice of the charming singer, the lark—

or to add to our native singers the mellow-note of the English blackbird, the soft cadence, low, sweet and clear, of the thrush, or the rapid, gushing warble of that flashing beauty of the grove, the chaffinch. Such music saluting our ears would be a thing of "perpetual joy" to all, and awaken in the minds of many of America's noblest adopted sons ecstatic and blessed memories.

Desirable! every lover of nature will admit; but how far is this practicable? It is no doubt practicable. Experiments made at Cincinnati and elsewhere prove this. Then, let us really start our societies for the purpose of encouragement and means, and give the matter a few trials. Success, of course, will vary with localities. How I envy the dwellers on the Pacific in this respect; all the north European birds, including the song-lark, would no doubt flourish there. With us winter is the difficulty. But let me say, to those now looking for birds abroad, that easier success might be had with those from the north of Germany than those from Britain, as some of the desirable kinds in the former countries possess the migratory instincts sufficient to change locality far enough to avoid the too distressing effects of winter. In being transferred here would not this instinct come into use if needed? The main difficulty in the work is, I understand, the cost; but if a good number of societies were instituted they could work in harmony, and this could no doubt be much lessened. Perhaps some of the gentlemen, who have so distinguished themselves in the introduction and propagation of fish, would be glad to give their aid in the congenial work. The success of our societies in America would no doubt lead to the establishment of similar societies in Europe, and, eventually, a system of exchange might be adopted which would much lessen the expense.

Lovers of nature, respond; let us now start the work generally. There can be no doubt of success. The end will be glorious. He who causes a bird to sing or a bee to hum, where such a one never sung or hummed before, adds new voices to nature, and is a co-worker with the Creator in up-building the æsthetic side of the universe. These minstrels will sing requiems over our graves, and, for the added and sweetened melodies, coming generations will call us blessed. To work!

LESLIE.

[Our correspondent's idea is a good one, and deserves the thoughtful consideration of all lovers of nature. The matter is one on which we have often dwelt, and we take this opportunity of urging its importance once again. The efforts hitherto made in this direction have been for the most part individual efforts, and have not been successful. In order that future attempts should be more so, it is essential that importations of foreign species should be made on a large scale, and that the various societies now in existence or about to be organized should work together. Leslie's article contains a number of thoughts which we commend to all interested on the subject of national acclimatization.—En.]

# DEER HUNTING AND BUFFALO SLAUGHTERING IN TEXAS.

NEW ROCHELLE, N. Y., Dec. 14, 1877.

EDITOR FOREST AND STREAM:

I learn through G. H. Ragsdale (one of your contributors), Gainesville, Cook Co., Texas, that five or six hunters from that city have just returned from their usual fall hunt near the place. Owing to heavy rains, they hunted but three days. They killed, of deer alone, forty-one, of which Capt. Rowland, the "Deer Slayer" of the party, killed twenty in two and a half days. This looks as if the deer are not yet quite gone there. I know they used to be very plenty in this region, and I have hitherto, through your columns, pointed out this, "the upper cross timbers," as the very paradise for sportsmen during the fall and winter. These grounds are within three or four days' ride from New York city. Wild geese also by the thousand (and, of course, ducks) were seen on the sand-bars in Red River, and ranging from 100 to 500 yards.

The question is asked me—how are the punts made and used? Will some one, who knows better than I do, please answer through your columns? Let some one give us a full article on punts; thereby we shall all learn. Herein lies the beauty and strong points of your paper—it educates all up to the standard point. But to return.

Speaking of the buffalo, the *Texas New Yorker* for Nov. says, "The buffalo hunters in the camp on the headwaters of the Colorado River have over 20,000 buffalo hides now ready for hauling to the markets in the lower counties." These hunters have been sending off their peltries during all the past year. The wagon trains which go West to supply the frontier posts, are reported as returning loaded with buffalo hides. They pass through Mason, the county seat of Mason county, to the city of San Antonio; and also through Palo-pinto, the county seat of Palo-pinto county, to old Fort Worth, the county seat of Tarrant county (all my old stamping grounds), at which two points they reach the railroads, and where the skins find a ready market. The *Galveston News* estimates the number of buffalo killed within the past year by these Western hunters at 200,000. Only think of the number! It fairly chills the true sportsman's blood to think of this immense slaughter. I say true sportsman, for these are quite all pot hunters. Slaughtering these 200,000 noble animals! And for what? For their hides mostly; to sell them for \$1.25 each for poor shoe leather, and this when the meat of each animal is really worth \$20 to live on. Without pursuing this subject further, which does not fall within the purpose of this hasty letter, I cannot refrain from adding, in view of the happy past, how sad to think that our dear little children, when out on their merry rides with the sleigh, and when pinched with piercing winds and Winter's cold, will soon be able to enjoy the nice, soft warm buffalo robe of our earlier days no more. These robes are worth, at all times—whether in the camp, the house, or the sleigh, or on the land or the sea—about six good Mackinac blankets, as we can all affirm. Let us all arouse, and declare for the robe and the buffalo.

When we shall come to lose this precious boon, the robe—as soon we must unless we cry aloud and spare not—then, indeed, will half the inhabitants of the globe sustain a great and irreparable loss, and one which cannot be remedied. Texas, especially, should be aroused to the importance of this subject. She should at once pass and rigidly enforce laws to protect her now very abundant game. Especially should she protect the buffalo, the most noble and gigantic wild animal of all our possessions.

MAJ. H. W. MERRILL.

## For Forest and Stream and Rod and Gun. AFTER THE NEZ PERCES.

CANTONMENT AT TONGUE RIVER, M. T.,  
Nov. 25, 1877.

JOSEPH and his band, after marching through Idaho and Western Montana, visiting the National Park, and having various conflicts with the military—Regular and Volunteer—came sufficiently near to invite the attention of Gen. Miles at Tongue River, M. T.

Orders were issued. We crossed the Swift Yellowstone on the 18th of September, passed up a ravine, where two of Custer's men were killed by Indians in 1873, over a high plateau which gives commanding views in every direction, cast one long lingering look at the fair farms and waving handkerchiefs on the other side of the river, and our march began.

We soon reached the Valley of Sunday Creek, and passed through a camp of Cheyennes and Sioux, our enemies of last year, but now firm friends. They surrounded last March, and the only secret of their conversion, after fighting them, is summed up in one word, "Justice." Their main camp is near the post. They are treated fairly, have sufficient food, and from time to time small parties, with an escort of soldiers, have been permitted to go out hunting buffalo. In this way they have provided themselves with new skin lodges, and are better off in every respect than before their surrender. This camp has just started out for a hunt, and greet us with hearty "Hows," as we march by them. A ride of seventeen miles through dust, and our first camp was made.

Sunday Creek varies from a roaring torrent after heavy rains, to an insignificant thread of alkali water, which is the usual condition. As progress is made toward the head of the Creek, the water is found in pools, and these at long intervals. Our second day's march is again over a dusty trail, through barren, fantastic, bad lands, alternating with patches of luxuriant grass.

After making camp, several men go out hunting. The pickets report buffalo in sight. Result of the hunt, one black-tailed deer. A few jack rabbits were seen during the day, but there is so much cactus that dogs have no show.

The next morning ushered in a bright, lovely day. I bagged a splendid buck antelope, whose horns would have been a fine trophy, but some teamster, who had no appreciation in his soul, threw them out of a wagon after a few days' march. One young officer, who had never seen a buffalo in his native haunts, killed two, and it would require a Nast to do pictorial justice to the scene. All sportsmen can appreciate the feelings of an ardent hunter as he bags his first specimen. The command had a hard day's march, and camped on a branch of the Big Dry Fork of the Mo. River. Just at dark we heard the war song of thirty Cheyennes and Sioux as they came riding into camp. They are our allies on this occasion.

Each warrior has one or two extra ponies, which are not ridden until in the immediate vicinity of an enemy. The loose ponies trot along in front, nipping the grass now and then. They don't present to the eye any indication of the fire within; but when the time arrives for action, sooner than I can tell it, the warrior strips for fight, catches up his favorite war pony, and, ye gods! what a change comes over rider and horse. The small snaky eyes of the former no longer look sleepy; they are flashing fire, while his pony pricks up his ears, dilates his nostrils, and darts off with the speed of the wind.

Our next day's march is over a rolling, picturesque country. We see recent signs, but no buffalo. Antelope are around us in great numbers. I knocked one over at the first fire; my orderly killed another. A great many were secured, and everybody had antelope for his supper.

We have rain in the night. Our beef cattle herd ran off; but on we march, leaving a cavalry company with the herders to bring up the strays when found.

We see plenty of buffalo, but orders have been issued to prevent firing. The lumbering fellows act as if they had received a copy of the order. They cross our trail, running between the advance guard and the next battalion. To accustom my horse to buffalo, I gave chase to one, and ran by his side for two hundred yards; but we have a long journey before us, and it behooves one to take good care of the beast that is to carry him in a chase after Indians.

If we can't do any shooting, we have the pleasure of seeing the Cheyennes kill a buffalo. Orders have no effect on our red allies. An Indian is as much excited over a buffalo as he is over an enemy.

We passed over a God-forsaken country to-day. For miles there was not enough grass to sustain a donkey. We camp in the Valley of Squaw Creek, and discuss the prospect of finding Joseph. Again, we have rain. As we travel down Squaw Creek we see fresh buffalo trails; some of them are worn two feet deep. The hills bordering the valley are covered with cedar and pine—fine places for black-tail and mountain sheep—but for the present we are intent on other business. A steamer transfers us to the north side of the Mo. River. We learn that Joseph has crossed the Big Muddy two days before us. Ferrying a command over the Mo. River means hard work for the men. It is a tedious job. While this is going on, our camp is in a beautiful cottonwood grove on the left bank of the river.

It is evening. One battalion marches out of the valley, over the hills, the men singing as they go. With the camp fires, the scattered animals, the rumble of the moving train, the crack of the drivers' whips, the occasional scream of the steamer's whistle, and the song of the cavalymen as they march off, the scene is intensely interesting, and it is difficult to realize that we are in the wilderness. Next morning the balance of the command toils up the hills and follows the trail. The Cheyenne Indians wound an antelope and chase it down. We have a windy, disagreeable day. Next day we see plenty of buffalo. We make a noon halt to allow the wagon train to close up. Buffalo come along to the mules and ponies, and quietly feed, looking up occasionally to see what their strange neighbors are doing. We march in the afternoon with the pack train, leaving the wagon train to follow more leisurely.

The Judith Mountains are to the southwest, while the Little Rockies are to the west and in front of us. Buffalo are on either side; one herd ran across the trail just in front of the column. Next day we have clouds and rain. We cross a branch of Milk River; Buffalo are all around us, and occasionally a herd dashes across our trail. In the forenoon we reach a gap in the Little Rockies. A swift-running stream, bordered by willows and filled with beaver dams, tumbles and dashes by, singing as it goes. Not far away there is a large pond upon which countless numbers of ducks plume their feathers, while others circle about in the air at the sight of their intruders. Some are lighting and dashing the spray; others are moving gracefully or taking wing. They need have no fear; we are not hunting ducks to-day. As we travel up the valley of the mountain stream, buffalo look in wonderment and dash across the trail, or leisurely walk over the hills.

The scenery is very picturesque—rolling, grassy slopes, ending in pine-covered hills on either side; pretty green valleys, hemmed in by precipitous, white, lime-stone walls, crowned by mountain pine; amphitheatres, terraces, ravines swift, clear streams, with beautiful little cascades made by the beaver dams;—these greet and charm the eye, and overcome all sense of fatigue.

There is evidently more rainfall here than on the prairie; the luxuriant bright green grass and abundance of water indicate it. The cactus and sage brush, our constant companions on the prairie, disappear. This would be a hunter's paradise. The water is palatable and wholesome; a very important matter. The majority of the water-holes and prairie streams are strongly impregnated with alkali. Besides the buffalo, elk, black-tailed deer, bear and antelope abound.

Next morning we had rain, but march as early as we can see to move, and go to the Bear's Paw Mountains, over a country which is much less interesting than the Little Rockies, although antelope and buffalo are seen. Much of the grass has been closely cropped by the vast numbers of buffalo recently here. As we approach the Bear's Paw there is an improvement. We camp in a valley near a pond filled with ducks. Two great hills tower high above us. It soon begins to rain in the valley, while snow falls in the mountains. Our scouts report the Indian trail not far away,

Sept. 30—Reveille at 2 o'clock A. M. The moon and stars shine in a clear sky, the air is chilly. We march as early as we can see to move. A wolf serenades us at our first halt by the side of a stream. We soon come upon the broad Indian trail. Our Cheyennes and Sioux undergo a sudden transformation; they are painted, stripped for fight, on their favorite chargers, and are a study for an artist. The picture lasts but a moment; they are bounding over the plain on either side of the column, which is now in rapid motion. To be astride of a good horse, on the open prairie, rifle in hand, has an exhilarating effect on the majority of men. To be one of four hundred horsemen, galloping on a hot trail, sends a thrill through the body which is but seldom experienced.

It is not long before the sharp crack of the rifle greets the ear; volley after volley from Springfields are answered by Sharps', Remington's and Winchester's. A Hochkiss Mountain gun, throwing a percussion shell, adds its roar to the general din. The bullets hum all the notes of the gamut, fit music for the dance of death; zip, zip, zip, thud, thud; the dirt is thrown up here and there, while others go singing overhead; riderless horses are galloping over the hills; others are stretched lifeless upon the field; men are being struck on every side, and some so full of life a few moments before have no need of the surgeon's aid. The explosive balls are not all on our side. One officer as he rides down the line is struck by a bullet which explodes, shatters the bone, tears a fearful hole in his arm and carries off a good portion of his ear. Our gallant commander, on a splendid steed, is here, there, everywhere. When the first horse is blown a fresh one is mounted, and off again. Three horses are ridden down during the day; their rider appears never to tire. The Indian herd, 700 head, has been captured, their village surrounded, and we can take our time. In the afternoon a charge is ordered and gallantly made. It develops the fact that more warriors are opposed to us than we supposed. A regular siege follows. At the first attempt to talk with them the reply is, "Come and take our hair." A dreary night succeeds an exciting day.

Oct. 1.—A cheerless morning, with clouds and wind and mist, succeeded by rain and, finally, snow. Early in the day we discovered in our rear two long lines of cavalry marching toward us on either flank. Were these Gen. Sturgis' troops, or the warriors of Sitting Bull? Many anxious moments were spent before we determined that they were buffalo marching in single file, with all the regularity and precision of soldiers.

The Indians were again halted. They come out with a flag of truce, and we see Joseph face to face. He is a man of splendid physique, dignified bearing and handsome features. His usual expression was serious, but occasionally a smile would light up his face, which impressed us very favorably. Several chiefs had been killed the day before, Looking Glass and Joseph's brother among them. Joseph appeared very sad; he was inclined to surrender, but did not have control of the entire camp. Joseph remained with us that night, while St. Jerome, Second Cavalry, remained in the Indian village. One wagon train arrived in the afternoon, bringing a twelve-pounder brass piece, which was of great service to us, as the Indians had been industriously digging rifle pits and holes for protection, which sheltered them from small arms very effectually.

When the firing began that evening there was great anxiety in regard to the fate of St. Jerome; but we learned next morning that the Indians had put him in a safe place, and said no harm should come to him if Joseph was returned safely to them. On the morning of Oct. 2 Joseph was exchanged for St. Jerome, who reports that there are at least 100 warriors in camp, and about 350 people altogether.

Oct. 3.—The camp is moved to a better position. Firing begins with both field piece and small arms. We are in a snow storm.

Oct. 4.—A disagreeable, raw, chilly, cloudy day; firing all day long. Gen. Howard, with two aids and a small escort, arrives in the evening.

Oct. 5 ushers in a beautiful morning. Firing was kept up all last night.

Joseph and several followers visit us again to-day. They are getting very tired of the siege; they don't like the big guns. The runners they had sent to the Assiniboins had been killed. The soldiers fired at them, citizens fired at them, Indians fired at them; they were ready to surrender, and soon afterward gave up their arms.

We begin our return march, Oct. 7, with 405 Nez Percés, from the octogenarian to the pappoose born during the siege. The country is rolling and picturesque, with snow and pine-covered mountains in the background. Sunshine and cloud shadows add to the beauty of the scene. The Indians clad in lively colors and strung out in a long line; the pack train, the pony herd, the mounted troops, the wagons, the wounded on travois, all combine to make an unusual and striking picture. Soon after camping dark clouds roll up, and lightning, thunder, wind and rain threaten to cause a stampede, but the storm soon passes over. Next morning dull clouds and rain, which finally pours down in a torrent, keep us in camp all day. It is interesting to watch the Indian boys at a game of mimic warfare. They take sides, select their ground, and each party mixes up a lot of mud. A piece the size of a marble is moulded and thrust on the point of a stick about three feet long, which is held by the opposite end, and by a sudden jerk the pellet is sent with considerable force and precision. They are experts in selecting cover, making feints, and taking advantage of any false move on the part of their opponents.

They are practicing a game which will train them for the real battles of the years to come.

Oct. 9—A pleasant day. The restriction in regard to firing has been removed, and antelope steaks are again seen at our supper table. Next day we have more buffalo around us; several are killed and the Indians are in great glee. The squaws, who are hideously ugly, are all animation and activity when around a carcass.

Oct. 11—A gala day among the buffalo. The Indians are in raptures over the prospect of replete stomachs.

Oct. 12—A bright, clear morning. We pass over a hill which gives a fine view of the surrounding country. The Little Rockies loom up grandly. They will long remain pictured on my memory as one of the most delightful places that a hunter could visit. One man killed ten antelope, and others were very successful. The next day was chilly, cloudy and windy. Buffalo are in sight, as they have been for many days. A huge fellow attempted to cross our trail. An old squaw, with an emphatic gesture, exclaimed in Chenook jargon, "Seucom muc-a-muc." (Heap meat.) I fired two shots from my rifle, and at the second fire an annoying accident occurred, which never happened to me before, although it does happen occasionally. The head of the shell was torn off by the ejector, leaving the balance in the chamber. I took the orderly's carbine, and at the third shot finished the magnificent monster to, the intense delight of the Indians. All three shots had taken effect. The tongue was handed over to me, while the rest was appropriated by the light-hearted followers of Joseph.

We arrived at the Mo. River in the afternoon, and the slow process of ferrying began. The majority of our wounded were sent down the river by steamer. An elk was killed at the mouth of Squaw Creek, but a short distance from camp.

Oct. 16—We start up Squaw Creek. A fine mountain sheep and three black-tailed deer were bagged during the day.

Oct. 17—A small hunting party go out to-day. I saw two black-tailed deer, and had a hasty shot at one. He came within 80 yards of me, but unfortunately two men were between the noble fellow and myself. As frequently happens, they were unconscious of his near proximity. An instant and he was gone. He was in sight again at 150 yards, but it was a farewell bound, and my shot did not stop him. He was such a splendid specimen that I had not the heart to grieve over his good luck. Seven mountain sheep were seen, and one enthusiastic young officer was determined to secure the head of the grand old ram, whose horns made one complete turn, and half of the next circle. The experienced hunter of the party said they would weigh sixty pounds. A long chase, and they got a good shot, wounding the ram and a doe. The seven were seen to go into a cedar thicket, and only five left it. The blood marks were distinct, but the thicket was full of fallen timber. They could not ride through it. They were so far in rear of the column that they could not trust their horses on the outside of the thicket, while they made a careful search on foot over a three-acre patch. They were liable to meet gentle savages, who had left their pipes of peace at home, and so they reluctantly retraced their steps and left the sheep to the wolves.

We had an illustration of the amount of lead an antelope can sometimes carry. One was struck seven times, twice with explosive bullets, before he stopped running. Two men who went to the right of that trail killed two fine black-tailed deer.

An officer who left us yesterday morning to examine the valley of the Mussel-shell River returned this afternoon. He had a detachment of ten men. They saw plenty of elk, black-tailed deer, antelope and two bears. The Mussel-shell is represented to be a splendid game region. It is the border land between the Sioux and Crows. A party who ventures there must be prepared to fight. Until recently no white man could go five miles up the Valley of the Mussel-shell without the risk of leaving his remains, minus his scalp, for the wolves.

October 18—We reach a branch of the Big Dry Fork of the Mo. River. Fewer buffalo and more antelope are seen on the march. October 19—We still have plenty of antelope about us. I saw a flock of sage hens. October 20—A pleasant morning. I killed a fine doe antelope at long-range. After reaching camp a herd of buffalo pass near, and a few of us gave chase. Two are killed, a fine cow and calf. I wounded one, but failed to bring her down, and after an exciting chase of four miles over a rough country I gave it up, much to the disgust of my orderly, who would have gone until his horse dropped in his tracks. It requires a decided effort to give up a chase which is thrilling to the rider, but death to his horse. It is a great abuse of horse flesh to run buffalo after a forced march of several hundred miles. The animals used for buffalo hunting should be led until the chase begins, and then a dash made, regardless of the ground. Any attempt to favor a horse at the beginning of a run only leads to a long and frequently fruitless effort. It is easy enough to catch the bulls; the cows and calves require good horses and bold riding to overtake them.

We could see two immense herds a mile away as we reluctantly turned our horses' heads toward camp, but the sinking sun warned us to loose no time.

We got into the Bad Lands, and meandered over a very rough, broken country, deep ravines, abrupt hills, fantastic mounds, yawning chasms—a very hell with the fires put out; but finally reached the open country, and were not long in making camp. The next day we made the head of the main branch of Sunday Creek. A great many buffalo and antelope were killed.

After a march of over 500 miles the command arrived at the cantonment on Tuesday, October 23. A lovely day. The scene was interesting and picturesque. The approach to the Post on the north side of the Yellowstone is over a high plateau, from which a road winds down a ravine to the river bank. First came the commanding officer and his staff, accompanied by Joseph and a few of his followers; then the advance guard, followed by Indians in picturesque groups; then the pack train and more troops, the wagon train and flanking columns, the pony herd and rear guard. As the command filed down the ravine, flags were unfurled, the band struck up, "Hail to the Chief," while cannon thundered forth a salute of welcome to the troops who had so successfully ended the campaign against the Nez Percés. REMSEN.

## OUR WASHINGTON LETTER.

CARP FOR SOUTHERN WATERS—A NATIONAL CARP HATCHING ESTABLISHMENT—VIEWS OF PROF. BAIRD, U. S. FISH COMMISSIONER—SALMON AND BROOK TROUT FOR MARYLAND WATERS, ETC., ETC.

[FROM OUR OWN CORRESPONDENT.]

WASHINGTON, D. C., Dec. 22, 1877.

The propagation of carp for the purpose of supplying the streams and ponds of the Southern States with this fish has occupied the attention of Prof. Baird, U. S. Fish Commissioner, for the past year, and the work has been pushed forward to a limited extent at the hatching establishment of the Maryland Fish Commission, in Druid Hill Park, near Baltimore. Arrangements are now being made, however, to prosecute the work with more vigor, and we are soon to have a National Carp Hatching Depot in this city. In the Monument lot, just south of the Executive Mansion, there are two large lakes covering an area of about ten acres, and a third one of the same extent can be made by constructing an embankment across the outer edge of a gully, bordering on the Potomac, which is filled at high tide and bare at low water. Prof. Baird for some years has been impressed as to the importance of the carp as a future element in the food supply of the United States, and I quote his reasons from a recent letter which he addressed to Hon. Henry G. Davis, a member of the Senate Committee on appropriations:

"First, The carp is a fish which has been domesticated for a thousand years in Europe, occupying there and in China the same position among fish that poultry does among birds, being susceptible of cultivation in limited waters and thriving in sluggish and muddy lowland streams, entirely independent of the temperature; indeed, growing more rapidly and faring the better the warmer the water. I am satisfied there is no mill-pond in any part of the Southern States where the carp will not thrive. It grows very rapidly, attaining the weight of two or three pounds in the course of as many years, and is extremely hardy. The flesh is excellent, the better varieties in Germany bringing a quarter of a dollar a pound and ranking among the most esteemed species.

"The second merit or special qualification of the carp consists in its being a vegetable feeder and subsisting readily upon aquatic plants, whether they grow naturally in its vicinity or are planted for the purpose of furnishing its sustenance. In this it differs from the trout, black bass, and other favorite pond fish, which, in order to become of practical value as a food supply, must be fed with meat, involving more or less expense, especially in view of the fact that it takes from five to ten pounds of flesh to make one pound of trout or black bass.

"I do not think it possible to over-estimate the future importance to the United States of this fish; and as you are perhaps aware, I have already imported a supply of breeders for the purpose of distributing their progeny to different parts of the country. These are now kept in the ponds in Druid Hill Park, Baltimore; but the space allotted to them is entirely inadequate for the purpose of their satisfactory propagation and multiplication. In looking around for some more suitable situation, I am advised by Mr. Rudolph Hessel, an experienced cultivator of this fish in Europe, and who is in charge of those in Baltimore, that he has never seen a more favorable place for carp culture than is to be found in the two ponds on the Monument lot in Washington. If these had been constructed especially for the purpose they could not have answered it better, with a little additional labor."

In the Deficiency Appropriation bill which passed Congress last week is a clause appropriating \$5,000 for the purpose of adapting these ponds to the culture of carp, and it is proposed to so grade the bottoms of the ponds that the water can be drawn off from one or the other at will, and the fish secured for distribution. In one of them there is a small island covered with trees, and shallow basins will be excavated upon this island into which the breeding fish can be placed. The opinion is expressed that these ponds with the basins above mentioned for breeders would be quite equal to many first-class establishments for purely breeding purposes in Europe, where so much attention has been paid to this fish. The grading will be commenced at once so that the fish can be transferred at the earliest possible date from Baltimore to Washington, and there will be an extended distribution of young fish in the course of the coming summer.

It will be remembered that Prof. Baird in an interview with your correspondent last summer, spoke of the value of introducing carp into the waters of the United States, and especially those of the Southern States for which it is eminently suited; and though he thought the carp did not promise to be as valuable as the mackerel, shad or salmon, it would be a fish of great commercial importance, for the reason that many can be kept in a small body of water. The meat of the carp is very palatable, free from bones, and as a food fish it stands high. On account of its quick growth and great increase it is regarded as the most valuable of all fish for stocking ponds; besides, it is ornamental, being of a rich golden color.

Two importations of carp were made in 1875, but of an inferior kind. Unfortunately, on account of hot weather and overcrowded tanks, all but twenty-two died on the voyage. Subsequently all died but eight, and from this small number

several thousand were hatched in the ponds at Druid Hill Park. Last year Mr. Rudolph Hessel, a German fish culturist of note, arrived with forty-four from ponds bordering on the Danube, in Hungary. These were fish of a superior quality; and, later, another supply from the same ponds was received, all of which were placed in the hatching establishment at Druid Hill Park, and already many young ones have been distributed in Maryland waters. The ponds in this city to which they will be removed were constructed by Gen. O. E. Babcock when he was Superintendent of Public Buildings and Grounds, merely as ornaments to the public grounds, and they are used every winter for skating purposes; but the breeding of carp in them will not interfere with this amusement in cold weather. Sixty thousand young California salmon have recently been deposited in the headwaters of the Potomac river by Maj. T. B. Ferguson, the energetic Maryland Fish Commissioner. The first lot of 30,000 was placed in the tributaries of the Potomac in the vicinity of Fort Pendleton near Oakland, Garrett County, Maryland, and the second lot, of about the same number, in the Potomac, near Piedmont and Keyser, West Va. They were hatched in the breeding establishment at Druid Hill Park from eggs received from the United States salmon hatching establishment on the McCloud River, California. The work of stocking the Potomac with salmon was first commenced Professor Baird, the United States Fish Commissioner, about four years ago, when thirty-five thousand young fish were placed in the Conecogogue, a small tributary of the Potomac, near Chambersburg, Pa., and later in the same season 35,000 were turned loose in a small branch of the Shenandoah, near Winchester, Va. The young salmon were placed in the extreme headwaters of the river, because there were no black bass there to destroy them; and, secondly, to induce them to ascend the river as high as possible upon their return from the sea in subsequent years, as the salmon, like the shad, return to the streams in which they were bred. Another reason was, the waters of these tributaries are cool and clear, and well adapted to the growth of young fish. By the time they descend the stream on their way to the sea they have attained sufficient size to protect themselves against the ravenous appetites of the black bass. It is anticipated that the salmon first put in the river will soon make their appearance on their return from the sea, and they have by this time attained a weight of ten or fifteen pounds. It is supposed they return in four or five years from the time they were first placed in the stream, though difference in the temperature of the water, currents, etc., may have more or less influence upon their return, and make the period longer or shorter. When they do come, it will be with a rush, and they will, no doubt, be plentiful until the time for their departure for deep water. It is their habit, I believe, to remain in the vicinity of their spawning grounds about three months before again seeking deep water.

The work of stocking the Potomac, as well as other Maryland waters, has been carried on for several years past by the Maryland Fish Commission until several hundred thousand young salmon have been turned loose in the Potomac alone. Last year I think about one hundred and fifty thousand were placed in the tributaries of this river above the point of rocks, and in the course of a few years we may expect magnificent salmon fishing in this locality. Major Ferguson expects shortly to have a supply of several hundred thousand brook trout eggs in process of hatching at Druid Hill Park, which he will distribute to all persons who desire to stock their streams with this most delicious of all fish. Several fine trout streams in the Shenandoah Valley, of Virginia, have been stocked with the speckled beauties within the last few years, and the sport of taking them was enjoyed by quite a number of visitors to that section last summer. Persons interested in having the larger streams of Maryland supplied with fine fish are becoming concerned in reference to the laws of the State for their protection. It has been stated that large numbers of young salmon and other valuable fish have been destroyed by the seine-haulers and "pound net" fishermen during the past summer. In some of the creeks contiguous to the Susquehanna and on the Eastern Shore, which a few years ago afforded great quantities of the smaller varieties of table fish, there are now none whatever. Shad and other larger kinds of fish have suffered to a great degree, many of them being taken when too small for market in the seines, and allowed to perish and rot on the shore. The attention of the Legislature will be called to this subject, and a strong effort will be made by Major Ferguson and others to secure the passage of a law to protect, within proper limits, the valuable productions of Maryland waters.

The Virginia Fish Commissioners are also paying much attention to the propagation of salmon for the purpose of supplying the waters of that State. They have also lately entered into contract with several persons at Trout Royal, on the Shenandoah, to catch 1,000 black bass for the purpose of stocking suitable streams in that State with these game fish. R. F. B.

## The Rifle.

### TEAM SHOOTING.

FOR THE "FOREST AND STREAM AND ROD AND GUN" MEDAL.

Under the following conditions this journal proposes presenting to the best team, members to belong to some regularly organized association, a gold medal:

Shooting to take place January 23, 1878, at Union Hill Schutzen Park.

#### RULES AND REGULATIONS.

Each team to consist of twelve men; ten shots per man. Shooting, off-hand; distance, 200 yards, any rifle; open to all clubs or associations.

No person allowed to compete in a team unless he is an active member of the club for ninety days.

Practice from 10 A. M. to 1 P. M.

Team shooting to commence at 1 P. M. Targets to be drawn for by each captain of each team.

Entrance fee, \$6 for each team.

Ring targets to be used, three-quarter inch rings.

After deducting the expenses for the markers, the balance will be divided to the second and third highest teams.

Shooting to be governed by the Schutzen Bund rules.

All teams can enter for the competition at the FOREST AND STREAM AND ROD AND GUN office, 111 Fulton street, city, on or before January 20, 1878.

Captains of teams entered will constitute the committee.

**SHARPS' AND RIGBY—A CHALLENGE ACCEPTED.**—In the *Volunteer Service Gazette* of Dec. 8th appears a letter from Mr. John Rigby, with the following paragraph: "To bring the matter to an issue; I am ready to arrange a match at 1,000 yards between two men shooting with muzzle-loaders, and two men with American breech-loaders, the latter to clean at their discretion; and the prize to be awarded to the squad making the best score in a given time."

We have authority to state that Mr. John Rigby's offer has been accepted by the Sharps' Rifle Company. To-day's mail will carry a proposition to Mr. Rigby which, as it is pretty liberal in its character, we hope will be accepted. It remains on Mr. Rigby's part of course to agree to the terms. Later we will give publicity to the details, which we for the present retain.

**YORKVILLE RIFLE CLUB.**—The following made an average of inners (3) or more in the third competition for the Y. R. C. champion badge of the Yorkville Rifle Club, held at Washington Park, Dec. 25th. Mr. J. L. Paulding won the badge for the first time.

|                           |                             |    |
|---------------------------|-----------------------------|----|
| J. L. Paulding, Pea Mar.  | 4 4 4 3 5 5 3 4 4 3 5 5 3 5 | 59 |
| A. Smart, Sh. Spor.       | 4 2 4 3 5 4 2 4 4 4 4 4 5   | 58 |
| J. S. Reilly, Winch Spor. | 4 4 3 5 4 4 2 4 3 4 4 4 5   | 56 |
| W. J. Duff, Sh. Spor.     | 4 4 4 3 4 3 4 3 3 3 4 4 5   | 52 |

At 100 yds. reduced Creedmoor target.

**GLEN DRAKE.**—The American Rifle Association opened Glen Drake Range, at Pelhamville, Westchester county on Christmas Day, to the public, with subscription matches and one all-comers' match, each 200 yards. Winners: 1st, Col. John T. Underhill, 19; Maj. G. W. Coburn, 19; John Wilson, 19. Second, Col. Underhill, 20; Major Coburn, 20. Third, Major Coburn, 27.

**MILWAUKEE, Dec. 19.**—Several shots at 900 yard were made when it was hardly possible to see the target. The members were pleased to welcome Mr. John Meunier on the range, who, in a few shots, showed that he could make bulls-eyes as well as ever, notwithstanding the loss of one eye. The scores were as follows—fifteen shots at 800 and thirteen at 900 yards:

|               |     |                           |    |

—We are pleased to announce that through their secretary, F. H. Jacobi, Esq., the Jersey Schutzen Corps will participate in the FOREST AND STREAM AND ROD AND GUN match for a gold medal to be shot for on the 23d January, 1878.

—We acknowledge the receipt of the report issued by Colonel G. W. Wingate, General Inspector of Rifle Practice, and General John B. Woodward, Inspector-General of Rifle Practice by the National Guard of the State of New York. The present crowded condition of our columns prevents our giving an analysis of this interesting report, which we trust will receive ample justice in our next issue.

## RECOIL AND UPSET OF BULLETS.

NEWARK, N. J., Dec. 4, 1877.

In your issue of July 5 we were allowed the honor of presenting to the numerous readers of the FOREST AND STREAM the subject of recoil, wherein we took the grounds that the real recoil in a gun did not take place until after the missile had escaped from it. Our claim was that the expanding column of gas forcing itself on the external air, and not directly the missile, produced the recoil; but it was admitted that the missile was a factor, in as much as the weight and retarding influences of the missile increased the density and consequently the power of the gas to produce recoil when the real object of resistance—external air—is met. We did not claim that the gun was always absolutely motionless while the missile was in transit through the gun, but that the slight pressure backward was to be ascribed to the advancing column of air preceding the missile, which was a sort of prelude recoil produced on the same principle as the final and more powerful recoil caused by the contact of the powder gases from behind the missile with the external air. Our theory was favored by some and opposed by others, both publicly and privately; hence it becomes us to stand in our proper light and show those that take the negative position the errors of their argument.

Two or three opposing notices, robbed of their garbled quotations and reflections, present their points in a comprehensive manner, but to remove their underpinning and let their fabric fall will show the weakness of other like structures. J. F. P. in the FOREST AND STREAM of July 26, 1877, presents the following: "If an individual stand on a skiff on water and push against another vessel of like weight and like size the force will be equalized and both vessels will move from each other exactly the same distance and at the same rate of motion; but if the vessel on which you stand be four times the weight of the one you are pushing you will only move about one-fourth as far as the other." This is a scientific fact showing the influence of one body upon another when separated by expansive force (action and reaction), which was most beautifully and mathematically illustrated by D. D. who very appropriately presents the subject by the introduction of a gun, as follows: "If a gun thirty-two inches long weighing ten pounds discharges a missile weighing one ounce at 1,600 feet in one second, while the missile is passing the gun, the gun will recoil one-fifth of an inch." This, also, would be true providing the gun and missile were separated when the expansive force was applied, but they are not, and neither of these illustrations any more represent the action of a missile in its transit through a gun than would standing on one's head. In order for both bodies to be thus separated by expansive force they must be both subject alike to the same elements of friction. Is the missile, while dragging on the inner walls of the gun, thus subject to the same elements of friction as the gun itself? We will see! We will take J. F. P.'s "Skiff on water" and call it a gun, and lay him on the bottom of it at the stern (hush pin) and call him the missile, a pole or any other agent with which he can apply expansive force we will call the powder. Now, while lying in this position, let him apply to the breech pin (stern) the expansive force (powder) and force himself to the fore (muzzle), and

if he can force the skiff back fairly one fraction of a hair he can lift himself by the waistbands of his pantaloons. For D. D. I would suspend two platforms by a cord at each end of equal weight, so that they would touch on one. I would place a large gun of some light material, say of tin, that would be just equal to D. D.'s weight, twice his length and would admit him in person. The muzzle of this gun I would have placed even with and looking out upon the contiguous platform. Into this gun, down to the breech, we would have D. D. place himself, and by any sort of expansive force applied to the breech he may be pleased to use, he will force himself to the muzzle. During this process he will not move the gun back, but on the force being continued and he being landed on the contiguous platform, the two platforms will be separated just equally. This experiment clears up two points. First, it shows that the philosophy by which bodies are separated by expansive force is not applicable to the transit of a missile through a gun. Second, that even though the missile is half the weight of the gun the gun is not forced back while the missile is in transit. Neither would it if it were possible for the disparity, if the missile weighed a ton and the gun but a pound.

In FOREST AND STREAM of Nov. 29 will be found some excellent remarks by Geo. H. Ferris upon the merits of breech and muzzle-loaders and the upset of bullets. In his reference to my contribution to F. and S., published a few weeks since, as follows: "'Straight-bore' gives the idea that the upsetting of bullets is of recent discovery," is a misconception. It is true that bullets were known to expand in the breech of the gun twenty-five years ago, but did they recognize the fact that bullets also encountered a force in front that mashed them as if pressed between the cushioned jaws of a vise? The force in front was our principal point, since the force behind was well enough understood.

In articles to *Rod and Gun*, and finally to FOREST AND STREAM AND ROD AND GUN, I had represented this force (air pack) which had been responded to and questioned by men of apparent reading and intelligence, which led me to question whether the fact had been previously noted, since I myself had not seen anything printed, or heard anything said upon the subject before being introduced by myself.

When I first introduced this subject of "air pack" I had reached the fact through abstract reasoning upon the forces at play in the firing of a gun; but I was so thoroughly convinced that such a force was present that to convince others I, through a rifle-shooting and a rifle-making friend, had instituted a series of experiments. The first experiments were with lead conoids of 230 grains, solid bee muzzle-loading rifle. The experiments were commenced with small charges of powder which did not mash the missiles, and the powder increased until the upsetting was manifest, when the charge of powder was noted. The powder was increased until the missiles were mashed like putty at the front. The heels of the missiles show but little if any evidence of violence when compared with those that had not been fired. To prove the fact still further, the same experiment was gone through with Creedmoor missiles containing 1-32 tin.

In order to separate the upset in front and the upset at the heel of the missile the inner chamber at the heel had inserted in it a snugly-fitting piece of hard wood. As soon as these missiles began to upset (mash) there was a neck formed in the missile exactly corresponding to the wooden plug effectually separating the two forces, viz: the upsetting force behind, from the powder, and the upsetting force in front from the air pack, or consolidated air in the gun. Mr. Ferris calls this air pack "reaction." I don't object to the term so long as he recognizes the cause—air pack.

A bullet could be upset by a blow from some solid agent with no other resistance than its own inertia, but this is not the case in the gun, but is upset from an accumulated force in front which may be proved by his own experiments. A force that upsets a missile in a pistol barrel will surely upset one in a rifle barrel, but a force that will upset one in a rifle barrel may not upset one in a pistol.

Some fine quick specimens of powder will burn up in a barrel two or three inches long, while other sorts, slow, would require a barrel perhaps two and even three feet long to consume it, and yet, in the proper length of gun, would make good shooting. 100 grains of gunpowder yield about 75.6 cubic inches of gases, and a gun barrel with a greater capacity than that will never discharge the missile with that amount of powder; and where the powder is fine and sudden in its explosion it will expend a large proportion of its force on the walls of the gun, on the missile, and in accumulating resistance by packing the air in front; consequently it is a failure in shooting except in pistols, and as shown by Mr. Ferris it may be made too quick for them even.

There was only a little hair standing up between Mr. Ferris and myself, that was hardly worth splitting, and what I have written has been more in a spirit to call attention and add testimony to the excellence of his paper than otherwise.

STRAIGHT-BORE.

## THE SCHOVERLING & DALY GOLD BADGE.

NEW YORK, Nov., 1877.

EDITOR FOREST AND STREAM:

We feel convinced that the attention of rifle experts, and those who wish to learn how to shoot the rifle, should be called to the benefit to be derived from practice with .22-cal. rifles. Such rifles are made quite as carefully and accurately as any short or long range rifle. At this season, in most sections, out-door shooting cannot be carried on, and the practice necessary to enable the marksman to enter the field in the spring with more skill and precision than when he left it in the fall, can only be had with perfect shooting during the winter with a .22-cal. rifle. There are thousands of young men likely to swell the number of rifle shots, who are deterred by the expense and time attending a long practice necessary to qualify them to enter matches, on account of the high cost target rifles. A few months' practice at reduced targets, with 3 lb. pull rifles, will enable any one who has the possibilities of a good shot in him, to enter at once in the spring into the ranks of the off-hand shots.

Our Ballard Gallery Rifle is a really perfect shooting .22-cal. Mr. J. S. Conlin, who has given more attention to gallery shooting and spent more money to get perfect shooting rifles than almost any other person uses the Ballard gallery rifle, and the good shooting of this rifle is corroborated by hundreds of the best shots.

What we would suggest is that in places where there are no 100-foot galleries, that clubs shall build them and keep them open after-noon and evenings for practice and weekly matches; also, that new clubs be formed who should patronize existing galleries or furnish their own rifles. This communication was suggested by the formation, a few weeks ago, of the New York Rifle Club for off-hand shooting, of which Mr. Chas. E. Blydenburg, the well known rifeman, is the leading spirit. This club, which will no doubt take a front rank among off-hand clubs, has weekly matches of different kinds at Conlin's gallery. The interest in the off-hand shooting, it is true, is increasing very rapidly, and the advantage of such practice is commencing to be better understood.

In order to bring this matter before rifemen, we will offer a gold badge to be shot for with .22-cal. rifles at 200-yard targets, reduced to 100-feet, Creedmoor rules, on a certain evening all over the United States and Canada. As there may be some difficulties in having proper rules for determining scores, we should be glad to have the suggestions of the readers of the FOREST AND STREAM in regard to the match.

SCHOVERLING & DALY,  
84 and 86 Chambers street, New York.

## MUZZLE-LOADERS VERSUS BREECH-LOADERS.

SYRACUSE, N. Y., Dec. 10, 1877.

EDITOR FOREST AND STREAM:

Dear Sir:—In your issue of Nov. 29 I read with much satisfaction an article from the pen of Mr. Geo. H. Ferriss, of Utica, N. Y., on the "Upset of Bullets," wherein he discussed at some length the relative merits of breech and muzzle-loading rifles. To the facts and opinions therein contained I shall not alio except to approve, for the points that he touched upon he touched with a master-hand. I should have been pleased had he gone more into detail and given some of the reasons for the wide-spread and growing popularity of breech-loading guns, as compared with that of muzzle-loaders.

First, they are generally manufactured by large companies, who can afford to keep men lying around rifle ranges to become experts in the use of their guns, and thereby make a reputation for them. Second, they are more convenient, and, having their ammunition already prepared by skillful hands, they are preferred by a class of men who shoot for pastime, and who, being able experts with the pen, like to make a record of their achievements. There is also a class of men who contribute to their popularity in another way, and whose positions are well defined in the following extracts from Col. Peel's report to the N. R. A. of Great Britain, of the international match at Creedmoor. After expressing his belief in the superiority of the breech-loader, he says: "To the gunmakers I would say, Do not stop to discuss the merits of your respective muzzle-loaders, but go with the times, and do not rest satisfied till you have produced a practical breech-loading rifle that will beat all the muzzle-loaders and breech loaders ever yet made." To the council of the N. R. A. I would say, "Whether you wish to encourage team shooting or not, hold out every inducement to the production of the best breech-loading rifles." And, still further: "Above all, set your face against the further use of muzzle-loaders, even if proved to be better for match purposes than our present breech-loaders. The former are relics of a by-gone age, and the chief obstacle to all improvement in a practical direction." This sufficiently shows the bias of the writer, and there are many like him who have a lingering distrust that the muzzle-loader may be the better gun for accurate shooting; but it is old now, and therefore it must be kicked out of the way to make room for their new-born pets.

I freely accord to them the right to advocate the claims of the breech-loader, but in all fairness they should rest them on their actual merits, and not claim for them a superiority of shooting qualities which has not yet been established by any proper test. Many persons who would otherwise prefer the muzzle-loader have been misled by this system of puffing and forcing the claims of the breech-loader, and have adopted it under the mistaken impression that it was best for long-range shooting. I freely admit that the best breech-loading rifles (with the ammunition as prepared for them by the makers) will beat the majority of muzzle-loaders at long-ranges. This is not because they are loaded at the breech, but is entirely due to the length and form of the bullet, and the manner of patching it, provided always, that the twist of the gun is sufficient to handle such projectile properly. The secret of their supposed superiority over the muzzle-loader lies in the fact that they shoot a cylindrical or bolt-shaped bullet of great length, as compared with the conical ones generally used in muzzle-loading guns. These bolts being much heavier than a conical bullet of the same length, and not encountering any more resistance from the atmosphere in their flight through it, it follows that if discharged from the gun at the same velocity, they will retain that velocity longer, or, in other words, have greater force toward the last end of a long flight. Heretofore it has been the common practice with the best muzzle-loading rifles to patch the balls with a round patch of sufficient size to cover the ball from one-quarter to three-eighths of an inch in length, according to size of calibre. This necessitates the use of a comparatively short bullet, because if a long one be used you must increase the length of bearing proportionately, in order to insure steadiness while being discharged from the gun. If the round patch is cut large enough to cover a longer bearing on the bullet, there will be so much cloth that the wrinkles or folds in it cannot be properly adjusted to the grooves in the gun. Hence, a very long bullet cannot (with a round patch) be properly fitted to the gun, and consequently cannot be made to shoot well at any distance. This difficulty is now happily overcome in the Warner muzzle-loading rifle, manufactured by Nichols & Lefever, of Syracuse, N. Y. They have a style of muzzling their guns and cutting the patches, which enables them to fit a bullet perfectly to the gun with any desired length of bearing. This enables them to shoot a ball as long and as cylindrical in form as any breech-loader can shoot. Their bullets are made in two parts and swaged together; the butt end of soft lead to fill the grooves of the gun, and the front end of a compound of lead and antimony, so hard that the action of the powder will not upset it. These bullets, in loading, are forced into the gun with a guide starter, which fits them perfectly to the gun, with the point true to its centre; and as their form is not changed by the force of the powder in being discharged from the gun, they are delivered from it with less friction, greater force and more uniformity than can be attained by any bullet dependent upon the action of the powder to fit it to the gun, as is the case with all breech-loaders. I quite agree with Mr. Ferriss that there has been no satisfactory test in this country as to the relative merits of breech-loading guns, and what we call proper muzzle-loaders. Further, I do not believe that the makers or advocates of breech-loading guns desire to make any such test. If any of them do, and wish to make it in a manner that shall be decisive, they can find an opportunity to do so by addressing

MUZZLE-LOADER.

Care of Windsor House, Syracuse, N. Y.

[We give our correspondent, "Muzzle-Loader," full space to promulgate his views, and it is but fair that we should do so, for it must be remembered that a great many sensible people in England, Ireland and Scotland still believe that muzzle-loading rifles are better than breech-loaders. Our own opinion we have stated innumerable times. Will any of our breech-loading manufacturers take up "Muzzle-Loader's" challenge of battle?—Ed.]

### DANGEROUS VOYAGES.

When one reads of voyages made across the ocean in a cockleshell one must at least give the adventurous mariner credit for pluck and seamanship, though sensible people do not look at such dare-devil exploits in the same light.

Hardships which lead to no permanent good, though they may call into play individual heroism, may be regarded as so much loss of time and energy. Looking over the list of those foolhardy people who have navigated the ocean in small crafts, we may make one notable exception, and that is in regard to the trip made by the Red, White and Blue. This was a life-boat, and an experiment of a crucial character was to be tried. This cylinder raft determined the fact that the system was an excellent one, was adapted to the end intended, and the reproach of foolhardiness cannot be advanced against those who sailed her across the Atlantic.

We now give briefly a short account of these voyages in modern times. Some twenty years ago a Cunard steamer met in mid-ocean a wee boat with two men on board. That the people on board of her wanted no aid was positive; they simply signalled latitude and longitude, and having obtained this the crew in the boat stood on their way. Who they were, where they came from, what they were after never was known. This boat and crew is one of the mysteries of the ocean. In 1850, three Cornish fishermen—and a brave, hardy, but not foolish set of men are they—took a long voyage. These mariners sailed from Penzance to the Cape of Good Hope. One would think that when they had a taste of the seas and winds off the Cape of Good Hope that they would have had enough of it. Not at all. They staid a short time at the Cape, then they trimmed sail and struck out boldly for the Indian Ocean, and hauled up finally all safe and sound at Melbourne.

In 1866 a lugger of twenty tons, hailing from Dublin, cleared for Liverpool and New South Wales, and made the run safely, some sixteen thousand miles, in 160 days. As they could not have sailed in a straight course, the average of speed must have been fully 130 miles a day.

The trip of the Red, White and Blue we have already adverted to. She sailed from Sandy Hook on the 9th of July, 1866. All hands arrived in England safely, save one poor dog, who died of sea-sickness.

It was Alfred Johnson who, in 1876, was idiotic enough to sail from Gloucester in a boat with himself as Captain and crew. About one hundred miles from the coast of Ireland captain and crew were upset in a gale, and his escape was miraculous. After having suffered terribly, Johnson landed at Abercastle, off Pembroke-shire, after being 77 days at the mercy of the waves.

The last lunatic was Thomas Crapo. Now a man has a right to drown himself—perhaps his mother-in-law—but not his wife. We cannot pretend to solve the question how Thomas Crapo induced his wife to sail with him. It might have been for affection sake, or because he wanted ballast or something to argue with. Anyhow, this adventurous couple put out from New Bedford on the 28th of May, and reached Penzance on the 21st of July. So ends the list of hair-brained people. We sincerely trust we may not have to chronicle any more such escapades. There are so many simpler methods of committing suicide that one wonders at this complicated way of courting a miserable death in a small boat.

—Capt. Pugh's steam yacht Passport, 85 tons, from New York for Jacksonville, blew her boiler out on Frying Pan Shoals on the 21st inst., and put into Wilmington for repairs.

HANLON.—Hanlon, the champion oarsman of Canada, has challenged Scharff, of Pittsburg, for a race next June.

HALF A TON OF WILD FOWL.—Mr. E. Clement Smith and Dr. Hanford, of Winnipeg, Manitoba, recently returned to that city from Dakota and Minnesota, three weeks of which time were spent in active hunting. They were successful in winning a wager that the result of their tour would be half a ton of wild fowl alone, whereas considerably over that weight was bagged.

## New Publications.

THE AMOURS OF PHILIPPE; a history of Philippe's love affairs, by Octave Feuillet, translated from the French, complete and unabridged, by Mrs. Mary Neal Sherwood. Published by T. B. Peterson & Brothers, Philadelphia.

It can be said of Octave Feuillet, as of very few contemporary French novelists, that he writes for the world and not simply for Paris. He writes of French life, but of a life which Americans can understand, and not in that ghastly melodrama which is so foreign to all our natural sympathies, but which is brought before us again and again in the work of all the Parisian novelists of the day. This, his latest romance, has just been completed in *Le Revue des Deux Mondes*, in Paris, and charmingly translated for Peterson's American edition, and is as strong and as earnest as any of the stories that have made Octave Feuillet's world-wide fame. It must have a large sale, as the price of it is but Fifty Cents a copy, and it will be found for sale by all book-sellers, and on all Railroad trains, or copies of it will be sent to any one, to any place, post-paid, on remitting Fifty Cents in a letter to the Publishers, T. B. Peterson & Brothers, Philadelphia, Pa.

## Rational Pastimes.

NEW YORK ATHLETIC CLUB.—The first annual winter meeting of this club will be held at Gilmore's Garden, Jan. 4 and 5. There are a large number of entries, and the various contests promise to call out some of our best athletic material.

POLICE ATHLETICS.—The Police Athletic Club has developed a great deal of latent athletic power. The police gymnasium is filled each afternoon with a large number of muscular young fellows, training for the competition games, which are to be held at Gilmore's Garden, Jan. 7th. The sports will consist of walking, running, wrestling, boxing and fencing. A bicycle race for the championship of America is to be the novelty of the evening.

VIRGINIA FOX HUNTING.—Mr. Page McCarty writes to us from Richmond, Dec. 21:

I went out twice during last week or so, and saw some good riding in Hanover and Chesterfield counties. On one day there were forty-four dogs (the Ashland pack, the Hanover and one private one). You would be surprised to hear from gentlemen who have hunted in England, that the hounds and the general style and boldness of the hunting here is much better—only lacking the scarlet coats and stylish make-up.

—A very old but good story has just been rehearsed in the columns of the *Land and Water* by Mr. W. H. Webb. In substance it is as follows: Dr. Fothergill, an English botanist and physician of note in the eighteenth century, successfully treated a ship Captain who arrived at London ill of yellow fever. The doctor would take no money for his services, but requested the captain to bring him two barrels of earth from Borneo. At length the earth was brought, and the doctor, having burned the surface of a piece of ground very thoroughly, sprinkled the Borneo earth upon it. The result was that 100 different sorts of new and curious plants sprang up. These novelties in floriculture, including geraniums, have since been diffused throughout the gardens of England. In these days when the introduction of new plants is so sedulously pursued, it is surprising that the method of Dr. Fothergill has not been more extensively tried, as communication with tropical regions of germ-charged soil is infinitely more frequent now than then.

SNORING METAPHYSICALLY AND PRONETICALLY CONSIDERED.—We print the following from the *Burlington Hawkeye* as a fair example of genuine American humor. Who else would ever have thought of spelling a snore? Phonetics have won.—ED. F. AND S.]

It was in the Cedar Rapids sleeper. Outside it was dark as the inside of an ink bottle. In the sleeping car people slept. Or tried it.

Some of them slept, like Christian men and women, peacefully and sweetly and quietly. Others slept like demons, malignantly, hideously, fiendishly as though it was their mission to keep everybody else awake.

Of these, the man in lower number three was the "boss." When it came to a square snore with variations, you wanted to count "lower three" in, with a full hand and a pocketful of rocks.

We never heard anything snore like him. It was the most systematic snoring that was ever done, even on one of those tournaments of snoring—a sleeping car. He didn't begin as soon as the lamps were turned down and everybody was in bed. Oh, no. There was more cold-blooded diabolism in his system than that. He waited until everybody had had a little taste of sleep, just to see how good and pleasant it was, and then he broke in on their slumbers like a winged, breathing demon, and they never knew what peace was again that night.

He started out with a terrific

"Gn-r-r-r!"

That opened every eye in the car. We all hoped it was an accident, however, and trusted that he wouldn't do it again, we all for-

gave him. Then he blasted our hopes and curdled the sweet serenity of our forgiveness by a long-drawn

"Gw-a-h-h-h-h-h!"

That sounded too much like business to be accidental. Then every head in that sleepless sleeper was held off the pillow for a minute, waiting, in breathless suspense, to hear the worst, and the sleeper in "lower three" went on, in long-drawn, regular cadences that indicated good staying qualities.

"Gwa-a-ah! Gwa-a-ah!" Gahwahwah! Gahwahwah! Gahwah-a-ah!" Evidently it was going to last all night, and the weary heads dropped back on the sleepless pillows, and the swearing began. It rumbled along in low, muttering tones, like the distant echoes of a profane thunderstorm. Pretty soon "lower three" gave us a little variation. He shot off a spiteful

"Gwook!"

Which sounded as though his nose had got angry at him and was going to strike. Then there was a pause, and we began to hope he had either awakened from sleep or strangled to death, nobody cared very particularly which. But he disappointed everybody with a guttural

"Gurooch!"

Then he paused again for breath, and when he had accumulated enough for his purpose he resumed business with a stentorian

"Kowpf!"

He ran through all the ranges of the nasal gamut, he went up and down a very chromatic scale of snores, he ran through intricate and fearful variations until it seemed that his nose must be out of joint in a thousand places. All the night and all night through he told his story.

"Gawoh! gurrah! gu-r-r-r! Kowpf! Gawawwah! ga-yah-hah! gwock! gwarri! gwah-h-h-h-h-h-h-h!"

Just as the other passengers had consulted together how they might slay him, morning dawned, and "lower number three" awoke. Everybody watched the curtain to see what manner of man it was that had made that beautiful sleeping car a pandemonium. Presently the toilet was completed, the curtains parted, and "lower number three" stood revealed.

Great heavens!

It was a fair young girl, with golden hair, and timid, pleading eyes, like a hunted fawn's.

AN EPISTLE FROM THE MAN OF UZ.—A Virginia correspondent, who has been slightly under the weather, sends us the following plaint of his unhappy condition. We are very sorry that he did not apply to us sooner. We know of several very effectual remedies, all of them vouched for by elderly unmarried aunts, which we should be only too happy to suggest did our space allow. We shall, however, publish our correspondent's address in full, with the request that each one of our readers may contribute every remedy known to himself or friends:

"Unfortunately I have not been able to shoulder arms this fall. I had bilious neuralgia in the head in July, then typhoid fever, and that left me with a breech-loading choke-bore concentrated neuralgia in the left hip joint, which prevents me from rising over the flats and far away. Hope soon to be clear of it. If I had tried all the remedies suggested I should have been on the outside of two druggist shops, six lemon trees, and had on my outside a few square miles of plaster, a James River fresher of cold water, a box of wet towels, three horse hair gloves, one electric battery, and now, confound it! I suppose you will, in the interest of your advertisers, be poking prairie or sod oil at me. Say, mister, did yer ever have a misery in your chest? I tried to-day to get up a club of twelve to divide aches and pains with me, but they all said it was more blessed to give than to receive, and they didn't feel like receiving."

[We relent, and withhold the address.—ED.]

—M. O. Husson gives the following test for butter suspected of having been adulterated with fatty matters: A given weight of butter and 10 parts of a mixture of equal measures of ether at 66 deg. C. and of alcohol at 90 deg., are formed into a solution in a water bath raised to a temperature between 35 deg. and 40 deg., and then cooled down to 18 deg. After the solution has been standing for twenty-four hours, pure margarine will be deposited. If the deposit does not exceed 40 per cent. or fall below 35 per cent., the butter is genuine; but if it is larger than the higher percentage, tallow has been used as an adulterant, and if it is smaller than the lower percentage, the presumption is that the natural butter had been sophisticated with lard, goose-grease, or some similar substance.

—Cockroaches, it appears, have become exceedingly numerous in some parts of France. So grievous is the plague of these insects that the people have adopted some singular expedients for relief. Toads have been introduced into not only the gardens, but the dwellings, and ladies are said to have even made pets of toads for the protection they afford. But one of the best results of the

plague is that the people have taken to the rearing of the nightingales as an ally against the cockroaches.

MESSRS. TIFFANY & CO., UNION SQUARE, NEW YORK City, have made extensive preparations for the approaching HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery, and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

## For Sale.

SECOND-HAND—A very fine Tolley breech loader, with two sets of barrels fitted to same stock; one pair 10-bore Damascus and very close shooting, other pair laminated steel and cylinder bore; weight, 9 lbs. and 9 1/2 lbs. This gun was made to order for the owner, and is very superior in every respect. Can be examined at gun store of HENRY C. SQUIRES, 1 Cortlandt street, N. Y. Nov 11

FOR SALE—An entirely new "Express" shot-gun, 12-gauge, made to order by J. D. Donagill, 59 St. James street, London. For details, address P. O. Box 787 Hartford, Conn. Dec 13 11

FOR SALE—One Sharps rifle, Creedmoor pattern, and one Nichols & Lefever sporting rifle; both in fine order and nearly new. Address C. H. FOOTE, Fort Henry, N. Y. Dec 20 11

## Hotels and Resorts for Sportsmen.

FOR SALE—A most desirable farm in Augusta Co., Va., at Fort Defiance, which offers the fullest advantages for hunting. Quail are in large quantities, and deer and turkey are in abundance in the neighborhood. Adjoining the property are some 2,000 acres of land, the lease of which for hunting purposes could be had at very reasonable rates. For a club of gentlemen desirous of organizing a place for hunting purposes, Fort Defiance would offer the best opportunities. There is a comfortable house on the grounds, already furnished. Price reasonable. Address, B. FOREST AND STREAM Office, 111 Fulton St., New York City. Dec 27 11

### HALSEY HOUSE,

ATLANTICVILLE, LONG ISLAND,

is nearer New York City than any house bordering on Shinnecock Bay. Is as near, and has as good shooting grounds, and as experienced attendants (with live geese and other decoys, batteries, etc., always on hand), nearer the station, the largest and the best kept house in the bay. L. I. RR. to Atlanticville Station. Fare, \$2. Stage meets all trains. W. F. HALSEY, Owner and Proprietor. Atlanticville, L. I., Oct. 29, 1877. [Oct 25

## Metropolitan Hotel,

### WASHINGTON, D. C.

## Carrollton Hotel,

### BALTIMORE, Md.

R. B. Coleman & Co., proprietors of these famous hotels, are well known to the old patrons of the ASTOR HOUSE, N. Y., and ST. NICHOLAS, N. Y.

### THE METROPOLITAN

is midway between the Capitol and the White House, and the most convenient location in the city. It has been re-fitted and re-furnished throughout. The cuisine is perfect; the service regular, and charges moderate.

R. B. COLEMAN & CO.

## Wild Fowl Shooting.

SPRINGVILLE HOUSE OR SPORTSMEN'S RETREAT, SHINNECOCK BAY, L. I.

By a practical gunner and an old bayman. Has always on hand the best of boats, batteries, etc., with the largest rig of trained wild-geese decoys on the coast. Special attention given by himself to his guests, and satisfaction guaranteed. Address WM. N. LANE, Good Ground, L. I. Nov 5 11

## UNION SQUARE HOTEL,

UNION SQUARE, Corner 16th Street, New York.

A. J. DAM & SONS, Proprietors.

ington, Cornhill and Brattle streets, Boston, Mass.)  
J519

**THE****New Dittmar Powder.**

THE CHAMPION POWDER OF THE WORLD

For off-hand shooting at short and long ranges.  
Unsurpassed for Cleanliness. Pleasant to shoot on  
account of little recoil and report. Desirable for  
hunting on account of little or no smoke. Un-  
equalled for rapid firing, as it does not foul and heat  
up the barrel as black powder. Great accuracy,  
penetration and good pattern. Safer than black  
powder. Address

CARL DITTMAR, NEPONSET, MASS.

## ORIENTAL POWDER MILLS

MANUFACTURERS OF ALL KINDS OF  
**GUNPOWDER**

Office—13 BROAD STREET, BOSTON.

**BRANDS**—DIAMOND GRAIN.

Agencies in the principal cities in the United States.

## THE HAZARD POWDER CO.,

MANUFACTURERS OF  
**GUNPOWDER,**

**Hazard's "Electric Powder."**

No. 1 (fine) to 6 (coarse). Unsurpassed in point of  
strength and cleanliness. Packed in square canis-  
ters of 1 lb. only.

**Hazard's "American Sporting."**

No. 1 (fine) to 6 (coarse). In 1 lb. canisters and  
6½ lb. kegs. A fine grain, quick and clean, for  
upland prairie shooting. Well adapted to shot-  
guns.

**Hazard's "Duck Shooting."**

No. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters  
and 6½ and 12½ lb. kegs. Burns slowly and very  
clean, shooting remarkably close and with great  
penetration. For field, forest or water shooting, it  
ranks any other brand, and it is equally serviceable  
for muzzle or breech-loaders.

**Hazard's "Kentucky Rifle."**

FFG, FFG, and "Sea Shooting" FG, in kegs 1 25,  
1 12½ and 1 12½ lbs. and cans of 5 lbs. FFG is also  
packed in 1 and 5 lb. canisters. Burns strong and  
moist. The FFG and FFG are favorite brands for  
ordinary sporting, and the "Sea Shooting" FG is  
the standard rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER.  
ALSO, SPECIAL GRADES FOR EXPORT OF  
ANY REQUIRED GRAIN OR PROOF, MANU-  
FACTURED TO ORDER.

The above can be had of dealers, or of the Com-  
pany's Agents in every prominent city, or wholesale  
at our office,

**N.Y. Newspaper Mailing Agency**

With the latest improved Newspaper Folding and  
Mailing Machine, No. 15 Spruce street.  
JAMES BRADY, Manager and Proprietor.

**Sportsmen's Goods.****THE****"Boston Shooting Suit"**

Is manufactured only by

G. W. SIMMONS & SON,

BOSTON.

Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat—have  
the name and manufacturer's address stamped upon  
it, and no suit is genuine without it bears this im-  
print.

The suit can be sent, securely packed, by mail to  
any part of the United States or Canada on re-  
ceipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We  
make but one quality, and that is the very best.  
The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice  
of either cap with havelock, or hat.

The material is of the best quality of duck, water-  
proofed by a patent process. The color is that  
known as "dead grass shade."

The seams and pocket corners are copper riveted  
and nothing is neglected to make the whole suit  
complete in every way.

This is what one of our best sportsmen says of it,  
writing from camp: "Miserable, drenching rain,  
pouring down in a perfect deluge, as if a second  
flood had come upon the earth, two portages to  
cross, and a swamp between them; that was the  
prospect before we reached our camping ground.  
Such a swamp, too; almost impassable, for where  
the ground was firm was an almost impenetrable  
thicket of thorns and what not, that looked as if  
it would tear you to pieces. Well, we got to our camp,  
and I must confess I was agreeably surprised on my  
arrival. Although I had been nearly eight hours  
under incessant rain, laboring and striving along  
under the adverse circumstances above mentioned,  
yet I found myself comparatively dry, and my  
clothes without a tear. For the benefit of our  
brother sportsmen, let me advise one of Messrs.  
Simmons' (of Boston, Mass.) Waterproof Suits.  
Oh! what a relief it was to find one's tobacco was  
dry, and that one could light a pipe; that you could  
laugh at your miserable friend, who stood shivering  
and shaling as if he had the palsy; and then, next  
morning, oh! what fun it was to see him mending  
his clothes, while I had not a tear to complain of.  
Ventilation, also, that great bugbear of waterproof  
suits, is legislated for in the most ingenious manner.  
No sportsman should fail to supply himself with a  
suit which is at once cheap, practical, and will last  
an almost indefinite time."

**Our New Overcoat—The  
"Plevna,"**

Water-proof, Mildew-proof and Moth-proof, is at-  
tracting great attention. It is made and sold only  
at Oakhill, Boston. The price is \$13.

It is a long overcoat made to wear to cover, or  
when diving or walking in stormy weather. It is  
perfectly waterproof, thoroughly ventilated, and  
just the garment that every sporting man should  
have.

**Our Leather Jackets and Vests**

are the great wind protectors. They are made  
from soft, pliable black leather, flannel lined, and  
sell at \$5 and \$7.

**Our Flexible Tan-Colored  
Waterproof Leather Coats  
and Breeches**

are considered the finest things ever made. They  
sell at \$12 and \$15.

An illustrated circular, containing full description  
of each garment, with sample of the material from  
which made, will be sent free on application.

ger attending its use, or any auxiliaries required to operate it. It can be loaded with  
ease and rapidity. It is extremely simple, and has no delicate parts to get out of order or wear  
out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.  
SEND FOR CIRCULAR. H. M. QUACKENBUSH, Patentee and Mfr, Herkimer, N. Y.

## Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

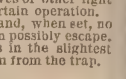

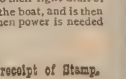

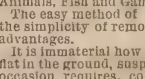

These Shells are easily loaded, and the caps easily extracted from inside.  
Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents  
it from driving through or springing away, thereby causing miss-fires. The Cone is made of metal, and is  
tinned solid in its place. Neither rusts nor corrodes, fast, like movable anvil made from steel. The Nickel  
Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either  
in steel or iron. These Shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses  
throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.  
Messrs. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better  
than any I have ever used. They are stronger and better in every respect, and I shall use them in all my  
shooting hereafter. Yours truly,  
A. H. BOGARDUS.

ESTABLISHED IN 1837.

## Guns, Rifles, Etc.

THE  
CHOKE-BORE  
MATCH.

W. W. GREENER begs to inform his numerous patrons in America that his gun has again come off victorious at the great match of Choke-Bore vs. Cylinder Bore, at the London Gun Club, on May 23, beating seventeen of the best shots in Great Britain who used guns by the best London makers, viz.: Four made by Grant, three by Purdy, three by Doulag, one by Lancaster, Boss and others.

[See London Field, May 26, Editorial Remarks.]  
"Mr. Cholmondeley Pennell, the winner of Mr. Purdy's massive fifty guinea gun, weighing over 51 ozs., for the highest score, shot wonderfully well, killing all his birds at 30 yards with the first barrel. The gun he used was a full choke, by Greener, of Birmingham. The result of the trial served to show the superiority of the choke at the long range. Mr. C. Pennell cutting down his birds in a marvellous way with his heavy Greener."

IRA A. PAINE'S  
CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known Sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

We can give the sportsman of America no better proof of the superiority of these balls than that W. & C. Scott & Sons, after examining every ball in the market, have ordered 2,000 to be sent to England. In no instance where it has been exhibited has it failed to take the place of all others.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

PAINE'S PATENT  
Feather-Filled Glass Balls  
and Huber Traps.

MESSRS. WILLIAMS & POWELL HAVE ORDERED 50,000 OF THE FORMER, AND FORTY OF THE LATTER. THEY WILL BE SHIPPED FOR ENGLAND ON SATURDAY NEXT. THIS, WITH THE LATE ORDER FROM W. & C. SCOTT & SONS, EFFECTUALLY ESTABLISHES THE SUPERIORITY OF THE

PAINE FILLED BALLS  
AND THE HUBER TRAPS.

Dec13 1m

Bogardus' Patent Rough Glass Balls  
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MAX IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8.

W. & C. SCOTT & SONS have ordered 10,000 balls and 24 traps to be sent to England

Sportsman's Gazetteer  
AND  
GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE  
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen: it gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the deer.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 297 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Casador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

## Blackbeard, the Pirate.

(Concluded.)

It was a bright, sunshiny day, this 17th of November, 1718, when, everything being in readiness, the gallant Maynard and his no less gallant crew started on their perilous undertaking. Unfurling their sails and hoisting the king's colors, the two sloops left anchorage at Kecquetin, on the James River, and sailed down toward the bay. Maynard, having learned that Blackbeard was certainly lurking in the vicinity of Okerecoch, and that his crew had been roaming all through the country, engaging in every kind of depredation, directed his course at once to the North Carolina coast. From the same source he was apprised that the pirate, at the outside, could not have more than half his men with him, and in this condition he hoped to surprise the party and kill or capture them before they could make any formidable resistance. With this design the English officer slowly and steadily made his way, obtaining all information of the pirate that the schooners and sloops meeting him could impart, and ordering all vessels going in the direction of his foe to drop in his wake. But notwithstanding all these precautions, Blackbeard had certain tidings of his approach from the secretary of Gov. Eden, who privately conveyed the intelligence Maynard sought to hide. However, instead of profiting by the knowledge, strong in his fancied security, and rash in his self-reliance, the pirate captain made no effort to collect his crew or prepare for the coming combat.

On the evening of the 21st of November, Maynard dropped anchor in Okerecoch Inlet, in sight of the two vessels of his foe. And now Blackbeard beat to quarters and put his vessels in a state of defence. The evening was drawing to a close, the water was shallow where they both lay anchored, and the channel was intricate, so that all thoughts of an encounter till next morning were put aside as impossible. A quiet night came on; the wind sank to a gentle breeze that scarcely rippled the waters; the stars one by one shone out in the calm depth of heaven and were reflected back in the languid, tranquil waves. The sloops swung idly in the current, and no sound of life disturbed the gentle peace that brooded over all.

The night passed slowly by, its moments leaden weighted to Maynard and his crew, who were oppressed with anxious care and forebodings for the morrow. Would another night find them alive? Were these their last hours in this world? Would they never see dear, absent faces again on earth? never hear the home voices they loved? Was this dream of life, with all its hopes, its joys, aye, its sorrows, over forever? Was the mystery of Eternity to be so soon solved to their souls? and to whose soul? Who would be taken and who left? Was there no answer on earth or sky or their own hearts? Nothing but the monotonous dip of the vessel to the incoming tides—nothing but that restless, maddening waiting. Yes, and how many there were indeed whose eyes were forever closed to the sinking of that sun for whose advent they waited! Brave, valiant souls that passed from life to death in all the abnegation of self-sacrifice! May Heaven have made amends for all, we pray!

Maynard and his crew sat on deck all the night and discussed at times in low tones the approaching event. The lieutenant paced the deck in alert watch; but such care was needless if he had but known it. Blackbeard and his men were passing those hours in wild carousal. He had given them as much to drink as they would have, and had then left them to themselves, while he and a trader, an inveterate and hard a drinker as himself, spent the night in a schooner lying near.

Blackbeard felt confident of victory. His long continued successes had induced him to believe his strength invincible. Besides, every detail of Maynard's force had been divulged to him; he knew there were no mounted guns on the attacking side. And though he was aware his own vessels were but half manned, as they lay anchored together in the stream, he never doubted but that his heavy guns would more than counterbalance this weakness.

At last the stars died out; a cool, fresh breeze sprang up; the waves began to glow with a faint hue caught from the coming morn. The glory slowly gathered in the East and

heralded the approach of full orb'd day. And now light streamed athwart the sky, and a pathway of gold lay wide upon the waters. On both sides the men were at their posts. Maynard called his men together and said to them: "My lads, it is no child's play we have undertaken. Instead of surprising Blackbeard, as I had hoped, he has by some unknown means discovered our intentions, and is thoroughly prepared. We will have a square fight, hand to hand; a struggle for life or death, where no quarter will be given or asked. You are all volunteers—picked men, and I have every confidence that you will do your duty. Remember, we must conquer or die." A loud murmur of assent was the reply, and every hand grasped his weapon more tightly, and every face grew sterner with the full import of the hour.

"Is your powder dry, and are your cutlasses well sharpened?" asked the captain.

"Yes!"

"Then, forward! and follow me!"

At the signal the anchors were weighed, and sending a boat ahead to sound the Inlet the sloop slowly advanced. And now while the intrepid officer is going forward to the attack, and the pirate with his desperate crew awaits the onset, I will seize this occasion to say that this is history, and no romance, that I am writing. Cooper and Reid may portray vividly the battles at sea, even as their own imaginations may suggest, and paint them with all the fervent colors that make them living realities. But this is a reality, founded on sober fact. Not only has tradition handed the event down, but old letters, old chronicles, old books all record the same plain unvarnished tale. Any one desirous of testing the assertion may do so by overlooking the old history of Virginia, and especially that quaint and ancient volume of "Johnson's History of Pirates." Though the combat reminds one of Homer's in the Illiad, it is none the less true that it was so daring, and none the less reliable and worthy though its record is not well known or often read.

But to proceed. The channel proved difficult to thread, and at every few rods a sounding had to be made. The advance was therefore necessarily slow. On the pirate's side the preparations were soon completed. The Guernseyman, commanded by Blackbeard, had only about one-sixth of her original crew; and on his own vessel there were but twenty-five men, though to embolden them he gave out that there were forty on board. His guns were loaded, and some of his crew were on deck armed to the teeth. Blackbeard placed one man at the powder magazine with a loaded pistol, sternly ordering him to blow up the vessel should Maynard capture it.

Maynard steadily approached the Pirate's ship, the Queen Annie's Revenge, which was anchored near the shore, his own sloop, the Ranger, leading. As soon as he was within gun shot, Blackbeard opened on him with round shot. The waters all around bubbled and hissed as the solid ball struck them, but fortunately none touched the sloops that kept their onward way. The sun was now rising high in the heavens, gleaming on the King's colors, the Union Jack, that Maynard ordered unfurled. In response the black flag was run up the halyards and flapped ominously on the breeze.

The light wind filled Maynard's sails, and his sloop surged ahead and neared the pirate. Seeing that his foe was trying to board him, Blackbeard cut his cable and endeavored to make a running fight, and sink his enemy with his guns. Maynard instantly divined this manoeuvre, and knew that if it could not be prevented his ship would be knocked to pieces. So he hurried on all sail, and made use of oars to accelerate his speed that he might the sooner close with the outlaw. In a short while he was near enough to use his small arms. But this did him little good, for the pirate's ship at once turned and gave him a broadside that smashed the top of his bow and wounded several men with splinters. It was becoming exceedingly critical with Maynard, when fortunately Blackbeard ran aground. Maynard, still keeping close to the enemy's ship with the intention of boarding, also stuck fast within a pistol-shot of the pirate. In the meantime the other sloop was following up Blackbeard's second vessel, and soon both were out of sight.

Finding himself thus aground, Maynard ordered all his ballast to be thrown overboard, even his water casks, and thus lightened, floated still nearer to his antagonist. Blackbeard stood in the midst of his men with only his face visible, and

such a face!—his beard, tied with red ribbons; his eyes, mad with fury and drink, gleaming like a savage beast's. He hailed Maynard, and, with bitter curses, asked, "Who are you?" Maynard shouted back, "You can see by my colors I am no pirate."

Neither side fired a shot, and, like the Trojan heroes, these rival captains kept up their menacing colloquy.

"Send a boat on board that I may know who you are," said Blackbeard.

Maynard answered, "I cannot spare a boat, but I will come aboard of you with my sloop."

Upon this Blackbeard took a glass of liquor and drank to him in these words, "I swear by my beard I give no quarter, nor will I give nor take any from you."

Maynard's reply came across the water as clear as a bugle, "I expect no quarter from you, nor will I give you any."

Even as he spoke, Blackbeard's ship slewed round and fired a whole broadside right into Maynard. The guns, double-shotted with grape and canister, did terrible execution. Maynard's ship's sides were cut up, and twenty of his men killed or wounded.

The battle seemed now already decided in favor of the pirate. Maynard ordered his men to lie close down, and he himself took the helm. Closer and closer he crept, till only a few yards separated the two vessels. In a low, quick, decided tone, he told his men not to move till he gave the signal. Some crouched on deck and others in the hold, with a pistol in the right hand and cutlass in their left. Thus, trembling from intense excitement, yet with nerves like steel, they waited their leader's command.

The two vessels collided, and Blackbeard made his men hurl into the king's vessel hand grenades, made of case bottles, filled with shot, slugs and scraps of iron, and in the mouth of each a match. Off went these infernal machines, snapping, crashing and roaring amid the noise and yells of the pirate horde. They did some damage, and created some confusion; but their leader's calm voice was heard, and the old salts, thoroughly disciplined, cowered closely in their hiding-places without betrayal of their presence. The explosion was soon over.

Blackbeard, seeing none of the crew visible but Maynard, shouted to his men, "They are all killed; follow me," and sprang on the Ranger's deck, he and his bloodthirsty crew yelling like demons. His appearance was enough to daunt the boldest heart, but he was opposed by a man equally fearless. When the outlaw boarded the ship, with his fourteen demons, Maynard gave his signal, and, like a thunderbolt, his men rose up and fell upon the foe. Swords clashed, pistols cracked, and the keen cutlasses were red with spouting blood. Hand to hand, and face to face, with every bad passion in their nature aroused, these men fought and tore each other like so many ferocious beasts. Now backward, now forward, they surged in their mad struggle. The metallic ring of the pistol, the dull noise of the deadly cut, and the gurgling cry of the dying, the groans of the wounded, the curses and oaths, the sullen splash overboard of the dead, mingled in one mad confusion, and made a scene worthy of "Dante's Inferno."

Maynard met Blackbeard face to face. They fired at the same time. Maynard stood unhurt. The mighty form of the pirate reeled and swayed backward, but only for a moment. The bullet had passed through his side, but struck no vital part. Hurling his pistol at his foe, the wounded man shifted his cutlass, and aimed a savage blow at his opponent, who turned it. Both men were fine swordsmen, and a terrible combat ensued. But Blackbeard's onset was so fierce, and his strength so powerful, that the Englishman could not do more than protect himself. He retreated, now parrying, now eluding—using his whole art in self-defence. The strokes descended like hail. One tremendous blow the Englishman parried, but in so doing his cutlass-blade was snapped off close to the hilt. Dropping the useless weapon, Maynard drew a pistol from his belt—but too late. Blackbeard aimed a stroke of his heavy cutlass at the young man's unguarded head. One of Maynard's men saw the danger in time, and threw up the weapon on a parry. The direction of the blow was changed, but the force with which it was given was so tremendous, that it beat down Maynard's guard and cut entirely off, the fingers of his right hand. Before Blackbeard could repeat the blow, the seaman gave him a bad wound in the neck, and the blood spouted from the cut, crimsoning his

great beard, and rendering his appearance, if possible, more frightful than ever. The wound instead of weakening him, seemed absolutely to increase his ferocity. He fought with the renewed strength of ten men. He cut down two of the crew who advanced to the rescue. But his life-blood was ebbing fast. Only that fierce, indomitable will was bearing him up. Like the gladiator in the Roman arena, his doom was fixed; it was only a question of time now—a few moments more or less.

For a little while the chiefs were separated in the fray. Between them raged the combat. The decks were slippery with blood. They had no breath now to cheer, or even speak. The clink of the steel was the only sound, as eye gleamed and hand, red with gore, essayed to drive home the blade of the knife. No one asked for quarter—not one of the pirates against whom the fight seemed going. For the huge form of their leader was still in the front and, true to his oath, his sword was rising and falling like a threshing blade. Already he had five bullets in his body. He had received twenty wounds from the cutlass; and not till the blood was drained from his veins would he yield. See! he is about to pull the trigger of a freshly drawn pistol!

He falls to the deck, stone dead! When that towering form went down the battle was decided. Eight of the fourteen were already dead, and of the six who were still fighting all were wounded. They begged for the quarter they never vouchsafed to others' prayers, and they received it.

The carnage was dreadful. Of the fifty men of the King's good ship *Ranger*, twenty were killed outright—three, it was said, by Blackbeard's own hand. Every one was more or less wounded, with the solitary exception of the mate, who, during the whole struggle, escaped without a scratch.

The other sloop of Maynard's returned unsuccessful from the chase, the pirate ship having taken advantage of the tortuous channel to withdraw from pursuit.

No event in the annals of American history was ever more daring, desperate and determined than this battle with the pirates in Okerechoch Inlet. Blackbeard was no ordinary foe to encounter. Under different circumstances, with good impulses at work in his heart instead of bad, he had qualities that would have rendered his name famous. As it was, all his great courage, his indomitable will united to genius, his born leadership of men, his fertility of expedients, prepared the way for his violent and bloody death, and he but reaped what he had sown. He died as he had lived, asking no quarter, giving none—shedding blood to the last.

His head was severed from his body and fastened to the prow of Maynard's vessel, when he sailed home in triumph. The sailor placed by Blackbeard to blow up the vessel lost the necessary nerve and was found concealed in the magazine with the cocked pistol in his hand. He only was pardoned by turning king's evidence; the rest being tried and hanged in Jamaica, where they were sent a few weeks after their capture.

An ovation awaited Maynard and his brave crew on their arrival in Virginia with their ghastly trophy. The Governor gave a great ball to celebrate the event, and the handsome Englishman walked the *minuet de la cour* with her ladyship, the Governor's wife.

Here my chronicles have end. Would I could follow the dictates of my fancy, and tell how my dauntless hero won the hand and heart of some beautiful Virginia heiress, and lived ever after in the highest state of mortal happiness. But, writing facts, truth compels me to say that history is silent as to Maynard's future. It is a matter of deep regret that the same so linked in Virginia's traditions with the bravest and most heroic encounter of all her many daring and worthy deeds should have passed away with no record of his future life. Certainly the gratitude of the oppressed and suffering were ever his, to follow him with blessings wherever he went, living or dead.

Blackbeard, it is certainly conceded, hid an immense amount of treasure at different parts along the coast. Some averred the place of concealment was in Hogg's Island, next to Cape Charles; others, that Okerechoch was the locality; and in the olden time not a few of our people believed that a vast amount of the pirate's money was buried at Craney Island in Norfolk Harbor. In this belief many an acre has been turned up with the spade by eager, hopeful seekers of these riches. It is beyond doubt that Blackbeard hid both money and plate. The night before his death he acknowledged the fact to the skipper with whom he was drinking. Being asked if in case of his demise, any of his wives knew where this treasure lay, he replied that no one but himself could find the spot, and his it should be who lived the longer of the two. In no doubt but the distempered fancy of the dreamer have the vast collection of ingots and bars of precious metals, the Dutch guilders and the Spanish doubloons ever been discovered. 'Like Kidd's treasures, they are as myths.

It is no hollow spot; there are no flowers spring in all their heavenly purity; no child's voice lingers on that air. Indeed, I saw it in my dreams—bleak, desolate. No step but his who buried his ill-gotten gains beneath the sod has ever trod its soil. The solitude was unbroken by any sound, save the cry of the sea-fowl as he wheels his flight above the waters, the monotonous beating of the waves upon the shore, and the mournful sighing of the winds, dashing across sea and land, like lost spirits chained to earth. Within its narrow precincts the serpent lifted his crested head and darted his forked tongue; trailing, poisonous vines and dark mosses, entwined in matted rankness, locked in the buried secret; venomous toads and slimy lizards lived and bred in the damp and dark; malarial airs and deadly vapors hung like a thick mantle over the scene and challenged life and interference. And it is said on bleak, wild nights, when the noise of the breakers rises high above the shrieking winds, let loose in tempest; when the stars and moon are blotted out in murky darkness; when the rain dashes madly down, and the lightnings play in lurid darts, a figure steals furtively along the wild. His great beard is tossed rudely by the wind; the hands grasp lantern, spade and mattock. The eyes have a strange, unearthly glitter. The light he carries gives a low, phosphorescent gleam, which casts fantastic shadows, and shines full upon the blood stains on the bands.

Reader, dear reader, should you or I meet alone at such a time upon such a coast this frightful apparition, it would be given to us to know the great Blackbeard had come back to this world of ours to unearth his wondrous treasure.

ALEX. HUNTER.

### AQUATIC PLANTS ONCE MORE.

HAD it not been for the FOREST AND STREAM and the discussion of various subjects in its columns, how many of us would have forever remained ignorant of much that is of inestimable value? Thus, in regard to aquatic plants suitable for fish ponds and the aquaria, how much have we learned. Some may think that this and many other subjects have been exhausted, but as science advances we shall wake up some morning in the future, and after looking over the files of our old papers, come to the sudden conclusion that then we were babes, fed only on milk, not strong enough or knowing enough to grasp all in one age. But to the point. Although I have had many years of experience with aquatic plants, I have waited, wrongfully, perhaps, for others to "speak my piece." Now what I wish to say is this: Of all the aquatic plants which I have been enabled to obtain for more than twenty years past, I have never found any to compare favorably with the water-mullein, family *Myriophyllum*. The plant grows wholly submerged, the flowering stems alone coming to the surface to mature. It is propagated from its branches, which flourish for a season equally well, floating. But to continue its growth the branches must be anchored in the mud or sand.

For the aquaria it is the most beautiful and valuable plant known, and will afford more oxygen for the life of the inhabitants than any other plant growing in our Western waters. This is the plant that abounds in our private and natural fish ponds and trout streams in this part of the country; and where it abounds it is almost impossible to over-stock the waters. In one of these ponds I have seen more than a yard square of this plant cut off close to the ground by the trout. It was shaved down as neat and as even as you could do it with a knife. What the object was I have not yet been fully able to ascertain. Some thought it for the purpose of clearing a place for beds, but I do not believe this, for the only place thus cut was at or very near the foot of the pond, and in deep and still water. My own impression is that the trout found some nourishment in the fat stalks, or they cut away the plant to get at some animalcula that they could not otherwise obtain from the thick matted beds.

There is another idea. These branches when liberated were taken in a mass by the current and lodged at the gateway, making a fine living shelter for the fish, and this, too, at the very place where the fish delighted to congregate. The plant affords such a great amount of oxygen that I have long thought that it might be successfully used in cans for the transportation of fish. For a full and specific description of the *Myriophyllum* we refer the reader to Gray's Botany. In June and July we can furnish any quantity of it, or it can be had of Fred Kaempfer, dealer in aquaria, 127 Clark street, Chicago, and perhaps at other natural history depots.

The *Valisneria* abounds in all our lakes and sloughs, but not in our trout ponds or streams. With me it has proved almost a failure for the aquaria, but as an aerator for lakes and more sluggish streams it may be of great benefit, but certainly for trout ponds and streams it has no value to compare with the *Myriophyllum*. Now let me say that the discussion of this plant question will prove of immense value to us. By it we shall surely learn that there are no waters, however sluggish, that cannot be made a natural and healthy habitat for some kinds of fish; and certainly that all living, running streams can be made the home of the brook trout or some of the salmo family.

Lake City, Minn.

DR. D. C. ESTES.

[Thanks to Dr. Estes for beautiful specimens of this plant.—*Ed.*]

## Natural History.

For Forest and Stream and Rod and Gun.

### THE DEATH OF PONGO.

By FRED. MATHER.

LIVERPOOL, England, Nov. 20, 1877.

A PRIVATE letter from Berlin, dated the 14th inst., announces the death of Pongo, the well-known gorilla of the Berlin Aquarium. His death is a loss to the scientific world, and was quite unexpected. I had an audience with him on the 5th, through the kindness of the Director, Dr. Hermes. Pongo was then slightly ill from a cold, and was in a warm room in bed, but on our entrance he uncovered his head and offered his hand to the Doctor, while turning his large, intelligent eyes upon the stranger.

Upon a request from his friend, which Pongo seemed to accept as an introduction, he gave me his hand, and would that I could utter, as Tennyson sings, "the thoughts that rose," as I took the honest hand of this direct descendant of one of the oldest families! It needed no gaudy armorial crest with rampant lion, nor asthmatic herald with brazen trumpet to proclaim his nobility; his long bony arm and powerful jaw would have been envied by Richard Cœur de Lion, or Regit aid Front du Boef. I read his thoughts beneath his pitying glance, and his great soul was evidently sorry to see that I had so far departed from the original type as to have but little hair upon my face, and none to speak of on my hands; that I had to deprive the living sheep of its wool to take the place of the hair which covered my forefathers, through the effeminate customs of my immediate progenitors in luxuriously clothing them, selves with skins and furs, thereby rendering the hair superfluous, and consequently causing it to fall off. He glanced at my foot (luckily a catskin prevented the mortification of exhibiting to him a foot without a thumb on it capable of holding to a limb while plucking bananas with both hands and the other one); he stuck out his admirable pedal and wiggling its thumb raised his eyebrows as if to say: "Got 'em?" My first impulse was to nod and say, "Oh! yes, I've got 'em, but don't use 'em now," but a look into that honest face, and like Macbeth's "Amen," the words stuck in my throat. Wherefore could I not lie to this simple minded brother? Something in the very confiding manner in which he asked the question banished all thought of prevarication, and demanded that his frankness be met with truthfulness at no matter what cost of personal pride or self-degradation. I despised myself for the thought that for the first moment I entertained of deceiving him in regard to this, and with a cheek burning with humiliation I shook my head and acknowledged that the polished catskin hid a member useless for anything but the simplest locomotion.

He accepted it with a pitying nod, and generously forbore taunting me by any further exhibition of movement in that direction, and at the earliest moment allowed by etiquette showed his good taste by unostentatiously withdrawing a evidence of pollexial superiority beneath his blanket, while could not help fancying him with his juvenile companions in the wilds of Orangumbesi enjoying a sociable game of "thumbs up," and gleefully showing "four of a kind" where "Simon says wig-wag!"

Dr. Hermes is a very accomplished physician and zoologist and did not then consider Pongo's cough and low fever at a dangerous, hence I was surprised to hear of his death so soon, and feel pleased that I secured an Imperial photograph of this, the only relative of that branch whom it has been my good fortune to meet personally.

Pongo, you will remember, was brought from Africa by Dr. Falkenstein, of the German expedition for African exploration, who founded a station at Chincozo, but who was unable for some reason to penetrate to the centre of the Continent. They remained there several years, and when they abandoned the coast of Loango they brought the subject of this obituary to Europe. He was a present, I believe, from some native tribe, who, being able to talk or to jabber something intelligible to themselves, have thereby fallen into the fallacy that they are the superiors of the other mammals of that region; but my prophetic vision beheld ships landing the civilizing Anglo-Saxon, with a very small Bible in his hand and a large Sharps' rifle in his right hand, following up the meccas tracks of Stanley, and opening a new world to commerce. But that does not bear on the gorilla question, except as to his probable capacity of yielding "sport" to the rifleman or profit to the animal trader. Poor Pongo! you was truly a "short life and a merry one;" never was gorilla so fated before. His age I do not know, he had been in Berlin nearly a year and a half, and might on a guess be from ten to ten years old.

His life in Europe was one grand holiday. He held receptions, and, on his recent visit to England, sat at the table amid the nobility; was fond of beer and other good things, and was as good tempered and well behaved a gorilla as one could wish. Never did he have to be confined or to submit to the indignity of a chain; but in his apartment in the Aquarium, with his companion, the Chimpanzee, and the dog, alternately slept and played away life. In England he was respectfully known as Mr. Pongo; a title rather more freely used there than in America, and evidently bestowed from anthropological reasons.

On his return to Berlin his arrival had all the character of the triumphal entry of a distinguished personage, and an enthusiastic reception was accorded him; all the officials at the Aquarium received him in full dress, a grand banquet and serenade was given him, and the Berliners flocked in crowds to see their old favorite.

When we consider the subject, his death is not really so much to be wondered at. My friend Conklin, of the Central Park Menagerie, and others versed in the habits of the quadrumania, all say that they do not live long when removed from their own country. Most monkeys die of consumption or decline of some sort. Ever the hardy Esquimaux, when brought down, cannot stand our climate; neither can the savage from the tropics. Civilized man alone, of all beings on this earth, can endure all climates; reared in the temperate zone he can stand the Arctic winter with the dwellers in Upper Navick, or bear the burning sun on African sands with the woolly-headed and delicately-perfumed Zambesian. And, again, the civilized stomach, through long generations of abuse, has a power of endurance unknown to savages. So the years of drunkenness that the white man can proudly recall, and mark the few months in which the red brother is laid with his toes to the roots of the daisies after worshipping at the shrine of a frontier Bacchus. Perhaps this may have a bearing on the lives of these elder scions of our family now under consideration; not that I would insinuate that Pongo was at all bibulously inclined, or even indulged if so inclined, but there most evidently has been change of food which would sooner or later have seriously affected this primitive fellow-creature had not catarrh anticipated it.

Adieu, Pongo! No cloud-piercing column will challenge the passer-by to pause and read thy many virtues, penned by loving fingers; but thy bones will be mounted for the benefit of the anatomist, and thy skin stuffed to resemble life more or less naturally, and instead of being doomed to "lie in cold obstruction and to rot," like us less favored bipeds, thou wilt still keep good company.

Dr. Hermes has several very excellent casts of Pongo taken in life, which I saw and had therefore an opportunity of comparing with the original; they only wanted coloring to be perfect. Pongo's countenance was that of an old negro with an exaggerated nose that looked as if it might have been literally "put on hot and run all over;" the eye was bright and expressive, and the face generally pleasing—such a face as Uncle Tom might have had, only no nigger ever had such a nose, no matter how well-developed specimens of compressed nasal organs can be shown in "Ole Virginny."

I do not remember that Pongo made any allusion to this feature; perhaps he only regarded it as ornamental, and rather a question of taste than physical superiority; or, in a chivalric spirit, forbore to press comparisons further after his triumph in the exhibition of thumbs, his generosity forbidding him to trample on a fallen foe. Retiring to my hotel and eating a good dinner, I think that I must have fallen asleep over my coffee and cigar, served in my own room, for I distinctly saw the door open and Pongo entered, but how changed; he wore a hat of the "nail-keg" pattern, placed most dissolutely on one side, and his unsteady gait told the shocking fact that he was inebriated; further evidence of this was furnished by his seating himself on the table, and winking at me while twirling all his thumbs, and singing in a husky voice the following refrain, which seemed in some sort familiar:

"My name is J. Pongo, I was born on the Loango,  
To keep me in Hoangbungijiji my father did try;  
But 'twas no use in talking, I slipped down the Grombeelongo  
I was bound to see the Aquarium in Berlin or die."

Noticing by an expression of sorrow on my face that I was not in sympathy with his roystering, he suddenly extended his four hands, and, grasping mine, stammered out: "Good-bye, ole fel; ta-ta; be good to yourself," and straightening his head he departed. It is a great pleasure to know that this scene was not a reality now that he has departed, for I would entertain a profound respect for his memory.

"He has gone to the land of the great Gnoob,  
Where he sits in a tree to watch the moon  
As he sails o'er the flat Gromboollan plain,  
And we never, no never, shall see him again."

[From a recent number of *Nature* we learn the cause of the sad death of Pongo. The post mortem was conducted by

Prof. Vireon and Prof. Hartmann, in the presence of a number of eminent Berlin physicians, and showed that the disease which carried off our friend was acute inflammation of the bowels. The cause of the disease is now no mystery, for there was found in Pongo's stomach the button of a glove, some iron wire and a number of pins.—Ed.]

**NATURAL HISTORY OF THE HOWGATE EXPEDITION.**—Naturalists may await with interest the success or failure of the Howgate Polar Expedition. The interests of natural history and ethnology are to receive full attention, Mr. L. Kumlein, accompanying the party as naturalist. He has been furnished by Professor Spence F. Baird, with the following memorandum:

The region you visit is one of the most interesting in North America and the least explored by the naturalist. It will furnish an ample field for research, especially as you will be on shore the greater part of your absence from the United States. Your great object should be to make collections of everything in the ethnological, animal, vegetable, mineral and fossil departments, so that you can prepare a report on the same, perhaps illustrated, to be published in some suitable paper on your return. In this view you should make copious notes of the habits, association and general condition of everything you meet with.

**Mammals.**—Of mammals, good mountable skins of the polar bear, prepared with alum or saltpetre, will be desirable. A series of reindeer should also be obtained, as well as foxes, hares and other animals. A good series of seals will enable us to solve many questions in regard to their own special home. The walrus, both male and female, should be procured, as many skeletons are procurable, and several skeletons of all mammals, land and water, will be readily marketable. The skins of cetaceans cannot readily be preserved except possibly in salt. Sketches should be made of the outlines and distribution of color of each, and the corresponding skins and skeletons preserved.

**Whales.**—Particular attention should be paid to the narwhal, of which skeletons are in much demand. Should opportunity be allowed you some skulls of the smaller whales should be procured.

**Birds.**—In regard to birds a special memorandum prepared by Dr. Brewer and myself has been furnished. You will, of course, look very carefully for the small insectivora and constrictors, so as to determine the northern distribution of our species. Probably saxicolas will be frequently met with. Of water fowl the rarer geese, the Labrador duck, Sabine's and Ross' gulls and the ivory gull are most desirable. Any petrels or shearwaters will be desirable. Look out for specimens of the black guillemot with a blackish bar partly across the white of the wing.

Reptiles you will probably not find, unless it may be a frog, which, of course, should be secured.

**Fishes.**—The fishes should be looked after very particularly, and especially the different species of trout, salmon and whitefish, which should be secured, if possible, of different ages and in the different seasons to show the variations of the spawning condition. Any large salmon or trout, say over a pound or two, would be better skinned and the skins put in alcohol, although a sketch of the original should be made. Other species of fish should be secured if they present themselves.

**Insects.**—Of course it will be important to obtain a full representation of the insects of the country—butterflies, beetles, etc. Whatever species of invertebrates are procurable should be gathered in—star fishes, shells, crustaceans and the like.

If you succeed in securing a complete series of all the animal life, if possible in several sets, the great object of your mission will have been accomplished. You should endeavor to secure a variety, but a complete collection will be of much interest.

**Mineral Specimens.**—Any choice mineral specimens should be obtained, especially crystallines. Get samples of all the rocks constituting the strata; these should be sketched, and their overlying position indicated and verified by specimens. Look very carefully for rocks containing fossil remains either of plants or of animals.

**Saurians.**—Some very interesting specimens of saurians have been brought from different portions of Arctic America, while the fossil plants are of very great interest. Make a thorough study of the ethnology of the country, securing as many crania of Esquimaux as practicable, and also skeletons if they can be got. Illustrations of the handicraft of the natives in objects of stone, bone, wood, etc., should be carefully gathered, especially any of great antiquity and such as are superseded by modern articles.

It is not improbable that Mr. Kumlein's investigations may decide finally the much mooted question as to the relationship which the Barren Ground Caribou bears to its woodland congener.

**QUAIL WITH ABNORMAL PLUMAGE.**—We beg to acknowledge from Jas. F. Carr, Esq., of Portsmouth, Va., two quails. One was the ordinary quail, and the other a nondescript bird, of whose identity he seems in doubt. Upon examination we are sure that the bird which excited our correspondent's attention was one of the common species of the *O. virginianus*, with a tendency to albinism. Both birds were females. We have noticed, last season and this, quite a number of quails having a plumage of peculiarly light color, tending to white. One of these, presented to us by Horace Fassitt, Esq., of Philadelphia, we have in our cabinet.

## THE LAMPREY.

PHILADELPHIA, Pa., Dec. 15, 1877.

EDITOR FOREST AND STREAM:

When lately looking over a file of your paper, I noticed an article signed "Halcyon" in your edition of April 12, 1877. This writer states that he saw a Lamprey making a dam in a stream of water, and asks to be informed what its object was.

X.  
[The Lamprey (*Petromyzon marinus*) inhabits the sea, but enters fresh water for the purpose of spawning.—Ed.]

Rev. J. C. Wood, in his "Illustrated Natural History," published in London, now describes the habit of the Lamprey, when preparing for spawning: "When the Lamprey deposits its spawn, it is obliged to form a shadow in the bed of the stream, in which it can leave the eggs a reasonable safety, and performs this operation with great speed and no

small skill. It takes advantage of the current to help it in its labors; and, by the mingled force of the stream and its own muscular action, soon contrives to carry away the pebbles that would interfere with the well-being of its future young. The process is simple enough: when the Lamprey has fixed upon a suitable spot by its unfailing instinct, it surveys the locality for a short time, and then sets vigorously to work. Fastening itself to one of the obnoxious pebbles, and disposing of its body so as to gain the strongest hold upon the rushing stream, it 'backs water' with wonderful energy, and fish and stone are soon seen tumbling together down the current. In this way the Lamprey will remove stones of such magnitude that a fish three times its dimensions would appear unable even to stir them. As soon as the stone has been moved a yard or two away, the Lamprey wriggles its way back again, and takes possession of another stone. By a repetition of this process, the hollow is soon made and the industrious fish is able to deposit its eggs therein."

Last summer, while shark fishing on the coast of Nantucket, a shark was hauled aboard, to which was attached a Lamprey, which was sucking blood from the fish, and which did not release its hold until it had been out of the water for some time. J. W.

## ALL ABOUT DEER.

EDITOR FOREST AND STREAM:

I wish you would be so kind as to give space in your valuable journal to the following explanations to "Sycamore":

The reason I say that deer will go off with their tails down when a shot passes close to their heads is from this fact: In the days now passed and gone, when deer were so numerous that I was not very particular whether I killed or not, I used to exercise my skill with the rifle by shooting at their heads, and I would make an occasional miss, and the deer would run off with its tail down, and act as though it was badly wounded; but upon bringing it down with the second shot, I could not find any sign of the first. Now, sir, I consider myself a pretty fair rifle shot, therefore I have reason to believe that my ball passed pretty close to the deer's head. As I think I have given "Sycamore" a sufficient explanation, I will add one for friend Clark, and at the same time beg him to favor the readers of FOREST AND STREAM with his views regarding the horns of the deer, as being an index to their age; he doubtless can throw some light upon the subject, as he has possessed a herd of deer for several years. Friend Clark seems to think that the deer I spoke of as being over a year old, as it had no spots, was a fawn of that year, but it was not. Although he is right about the fawn's not retaining its spots longer than four months, he seems not to be aware of the fact that the fawn shows the blue before its spots are entirely gone. The one I spoke of was perfectly red, no blue hair on him, and he was about as large as two fawns would have been at the time I killed him. I await the next. ANTLER.

[The foregoing communication has been inadvertently pigeon-holed for several weeks. We hope the hiatus will not impair the value of the discussion between the writer and his friends, from whom we hope to hear in due time.—Ed. F. and S.]

## CALIFORNIA MOUNTAIN QUAIL.

LOS ANGELES, Nov. 18, 1877.

EDITOR FOREST AND STREAM:

In the FOREST AND STREAM AND ROD AND GUN OF Nov. 3, I notice a query as to the probability of California quail standing the cold weather of your Eastern winters. I may be mistaken, but my impression is that the experiments of introduction have been made with our valley quail only. The mountain quail is a much harder, as well as in every way, a finer bird; and would, I think, live and do well in the Middle and South-western States. They remain in the snow belt on the San Antonio (Coast Range) Mountain throughout our winter, and although the orange trees are in blossom in the valley, it is cold enough up there, as I have many good reasons to know. I am sorry that I am not ornithologist enough to describe, technically, the two birds, but I am well acquainted, practically, with the habits, range, appearance, etc., of both varieties. If you wish it I will write you what I know. H. M. MITCHELL.

[We should be very glad to hear from our correspondent on just the points which he mentions.—Ed.]

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

## SHEEP RAISING IN NEW MEXICO.

HOME RANCH, CINNAMON P. O.,  
New Mexico, Dec. 4, 1877.

EDITOR FOREST AND STREAM:

"Sheep raising in New Mexico" has been the subject of many a letter to the press, but my opinion of every one I've had the fortune to read is that it has been written by a party who knew only what he had been told of the business, and it may be that my six years' experience as agent for the Burdett Loomis Sheep Co. has taken the romance out of it, and mine may be too practical a letter to be readable.

This country is so very little known, I cannot expect to be understood. If I should give a description of the country, and not write its history, which would be so long and dark, I'd not care to relate it, even if I were capable. The sheep of this country were formerly from Spain, and were without doubt pure Spanish merino, but from the ignorant manner of their breeding in this country they have deteriorated till they do not bear the slightest resemblance to the pure stock, and even breed the most curious monstrosities, such as four or more horns, and they often have a third horn in the centre of the forehead, while the fleece has become so coarse it is often nearly worthless; and the average weight of the unimproved Mexican fleece is not over one and a half pounds per annum. This may seem a dark outlook for improving a flock out of such a stock, but the effort of a cross of any fixed blood on these mongrels is wonderful, and produces a half-breed we need not be ashamed of, and the increased weight of fleece and improved quality makes the improvement a good investment.

Mexican ewes cost an average of about \$2 per head. They are very hardy, good mothers, and their milk is equal to any in the world for sweetness and excellency of flavor, though they are too small for good mutton sheep.

Some of the flock-owners have great numbers. Two or three families claim to have more than 100,000 sheep each, and those probably live at their ease, surrounded with pens, and in a style very much like the old cotton planters before the war. Some of these large flock-owners have caught the

spirit from the white men who are growing improved sheep all around them, and have introduced fine merino and cots-wold rams to their herds, and only the smaller bands soon will be what we call here "natives."

I trust I will be excused if I speak of the flock in my care, which is one of the best improved flocks in the territory, numbering about 10,000 head, and shearing nearly five pounds per head per annum. This flock was started in '72, from the best improved ewes we could buy, and has been bred with care, and a view to mutton and wool qualities, and we cannot realize that it bears any relations to the native breeds by its appearance now. Owing to financial embarrassments of Eastern proprietors the flock has recently been offered for sale, together with the finest ranches in this part of the country, and to cash purchasers will be sold at a great bargain.

Having ground this ax, I will say, the fact that sheep can graze the year around without shelter or any provided food, save the natural grass and the superabundance of free pastures, makes the growing of wool a complete success, and it is no longer an experiment. The grass dries on its roots, and is kept during the winter in the dry climates like concentrated nutrition; and it is wonderful how well the stock keeps its condition through the winter.

The lambing season is latter April and May, and the grass starts enough for good feed for the earliest lambs. July and August furnish the rain for the year, with the exception of now and then a shower before and afterwards, on rare occasions. The climate is wonderfully beautiful, and is especially good for those inclined to pulmonary troubles.

The altitude, being about 6,000 feet above sea level on the plains, gives a rare and pure air, and the climate has a fascination for every one who tries it. Were I to write of its game and people, and the grand scenery, it would take too much of my time, and my "capability" may already be a matter of doubt, so I desist. I am, with respect, very truly yours, H. M. ARMS.

For Forest and Stream and Rod and Gun.

## ORIGIN OF THE VARIOUS CLASSES OF STRAWBERRIES.

THERE is no *Natural Order* of plants with which cultivators of fruits are more generally acquainted than *Rosaceae*, and, perhaps, there is none that is more variable in character, or, in other words, less constant in fixedness of specific distinction. So much is this the case that our systematic botanists are often confused in the determining of species owing to this peculiarity. True, we can commonly trace very distinctly the difference between the several genera, as for instance, *Rosa*, the family of roses; *Rubus*, the Blackberries and Raspberries; *Fragaria*, the Strawberries, etc.; but when we come to examine more in detail and get among the so-called species of the several genera we find a sportiveness of character that oftentimes baffles the stickler for hereditary exactness, and acts as a barrier to whomsoever would endeavor to describe, in words, the minutiae of outward form or organic structure.

The genus *Fragaria*, that is the Strawberry family, is no exception to this rule, and yet, notwithstanding, there are several apparent species found growing in their native habitats which hold their individuality somewhat firmly so long as nothing transpires to interfere therewith, or no other species is located in the same neighborhood, and whereby the pollen of either may fertilize its companion. We have, however, ample evidence that our present subjects are not very particular as to the laws of monogamy, the result being a remarkable increase of varieties from seed.

This being the case, let us consider the source from which, and what has conducted towards the bringing about of the great improvement in size and quality of our strawberries during the last thirty or forty years. At the commencement of this period the only strawberries in cultivation in the United States were but a slight advance from the native species, while at the present time American strawberries are equal to those of any other country, either in size, flavor or texture.

The several species that have given rise to the numerous varieties, both here and in Europe, are *Fragaria virginiana* with its sub-species *lowensis*, *vesca*, *chiloensis*, *grandiflora*, *elatio* and *collina*. These have, as established by botanists, some claim to specific differences, with finely drawn and distinct characteristics, provided we keep out of the never-ending hunt after ever-changing minutiae which some persons are so prone to.

To make this part of our subject plain it may be well to give the most prominent and distinguishing characters of these respective species with a few remarks, incidentally by the way, as we travel along; and, firstly:

**FRAGARIA VIRGINIANA.**—A native of our Atlantic States—Fruit roundish ovoid; achene, or seeds, imbedded in the deeply pitted receptacle, or what we generally call the berry; flavor, sub-acid; texture, soft. These characters are somewhat absolute and direct, and there is no mistaking the organic form. This species is certainly the original parent of what are known as the *Scarlet Class*, including such sorts as Jersey Scarlet, Roseberry Scarlet, Grove End Scarlet, and, possibly the Iowa Seedling, by some considered as a species, viz., *Fragaria lowensis*, and many others. Allow me to remark here that this sub-species, if such it be, is very distinct from *Fragaria virginiana*, and yet it partakes of the latter's general character as to robustness, softness of fruit and sour flavor; but the Iowa is larger and more globular, with the base of the fruit sunk down upon the calyx, and we may venture with certainty to assert that most of our largest varieties of years gone by, such as Ohio Mammoth, McAvoy's Superior, Austin, etc., in fact all the former Western kinds of any note, had their origin from this base, and even those of the present day have been so affiliated in connection with the European kinds, and consequently a portion of the firmness of flesh and sweetness of *Fragaria chiloensis* is established in their quality. Hence we may account for the well known difference between the American sprightly sub-acid flavor compared with the European honeyed sweetness, the latter having a preponderance of the *Chiloensis* with some admixture of the indigenous species, as found there, viz., *F. vesca*, and perhaps a trifle of the native aromatic *F. elatio*. In connection with these conclusions I quote the experience of that reliable authority on these matters, John Dingwall, of Albany, N. Y. He says in a letter to me, "The Austin originated a few miles from me by the Shaker Community and was named after one of them, Jeremiah Austin. It was an accidental seedling of an old variety known as the Iowa, which was identical with it, but being a seedling, perhaps it had a little more vigor and no doubt was better cultivated, but its foliage, its habit, its color, its flavor were out and out Iowa. The Iowa, I believe, is the indigenous strawberry of that State and largely culti-

ated at one time around Cincinnati, and known under the name of the Washington, and first brought into notice this way by Robert Buist, of Philadelphia."

**FRAGARIA VESCA**—Achenia, or seeds, superficial on the conical or hemispherical fruiting receptacle (not sunk in pits). This species has the greatest geographical range of the whole genus, being indigenous to Europe and North America. It is subject to great variation in the different localities where it is found in a wild state, and hence by speculative and theoretical observers has been accepted as good material for displaying and encouraging their species-making propensities. In some examples the fruit is globular; this is generally the case in Europe, while in others it is conical, but invariably the seeds are either raised above or level with the outer surface of the receptacle. Sometimes the flavor has a honeyed sweetness and is always less acid than the *Fragaria virginiana*. This species, in the remotely first instance, has been one of the parents of some of the European sweeter varieties.

**FRAGARIA CHILOENSIS**.—This species is indigenous to the western slope of our continent, from Puget's Sound to California, and, most likely, on to South America, although we have no record of its having been found near the Equator. Torrey describes it as follows: "Flowers, large spreading; leaflets coriaceous, broadly ovate, very obtuse, coarsely serrate, rugose, very silky-villous beneath; peduncles and calyx silky." And Loudon says: "Large oval, thick hairy leaves, and large flowers, the fruit large and very firm." There is no species of strawberry that is so changeable of character in its native habitats as the *Chiloensis*, and hence the many aliases that have been applied to it by the different authors and botanists, but the above descriptions cover the general ground and establish the identity of a very distinct organism. We find these characters more or less prevailing in all the largest and finest varieties in Europe, and those of the same quality in America testify to the same structure, only somewhat in a lesser degree, consequently we may claim with tolerable certainty from this standpoint alone that the *Chiloensis* has entered largely, and originally, into the constitutional organism of the best kinds from a structural consideration; and the history of said sorts, if it could be correctly collected, would, most likely, conform to this conclusion. For instance, the English varieties, Myatt's British Queen, Willmott's Superb and Keen's Imperial Seedling which are known to be nearly pure from *Chiloensis* former stock. Also our once famous Wilson's Albany Seedling, a cross (on the maternal side) of the British Queen fertilized by the Ross' Phoenix, a native variety of the Iowa type. With regard to the history of the Wilson I again quote Mr. Dingwall, above mentioned, who says: "About the year 1845 or 1846 Mr. James Wilson, of this city (Albany), originated this strawberry. I have been acquainted with it from its first appearance in the seed pan till now. It was raised from seed of the well-known English variety the British Queen, impregnated by one known as Ross' Phoenix, a variety raised by a worthy old Scotchman named Duncan Ross, of the city of Hudson, New York State, a good berry but not very productive. I have seen nothing of it for many years. So much for the origin of the Wilson strawberry, although now getting out of date it has had a run exceeding any other variety known to me, and stood on its own merits." Now when we compare the character of Wilson's Seedling with the well-known firmness of flesh of the *Chiloensis*, and, also, the preponderating same quality which exists in the British Queen, as grown in Europe, which is derived from its close relationship with this species, it may be plainly seen where the Wilson's best properties, viz., solidity and free bearing, comes from, and why it has been so good a berry to withstand rough-and-tumble conveyance to market with so little injury. Similar soundness has undoubtedly been acquired from the native Iowa breed. Please to notice that the Wilson's Seedling derives its constitutional vigor from both parents, and the free bearing quality and texture from the maternal side, while the flavor of the fruit is similar to the male.

New Brighton, S. I. WM. CHORLTON.

(To be Continued.)

**HOW TO TREAT WET BOOTS.**—When the boots are taken off them quite full of dry oats. This grain has a great fondness for damp, and will rapidly absorb the last vestige of it from the leather. As it takes up the moisture it swells and fills the boot with a tightly fitting last, keeping its form good and drying the leather without hardening it. In the morning shake out the oats and hang them in a bag near the fire to dry, ready for the next wet night, draw on the boots, and go happy about the day's work.

## SPLIT BAMBOO RODS.

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Sea and River Fishing.

### FISH IN SEASON IN JANUARY.

#### SOUTHERN WATERS.

Pompano *Trachynotus carolinus*. Grouper *Epinephelus nigritus*. Drumm (two species). Family Scia. Trout (black bass), *Centropomus niger*. Striped Bass, or Rockfish, *Roccus lineatus*. Tailorfish, *Pomatomus saltatrix*. Sheepshead, *Archosargus probatocephalus*. Black Bass, *Micropterus salmoides*. Snapper, *Lutjanus caesus*. *M. nigricans*.

**FISH IN MARKET.**—Bass, small, 25 cents a pound; large 20; bluefish, 15; salmon, frozen, 30; mackerel, 25; shad, 15; lobsters, 10 to 12; sheep's head, 25; scallops, per gallon, \$1.50; soft clams, per hundred, 30 to 60; whitefish, 18; pickerel, 18; smelts, 10 to 12. Several shad in good condition have been have been caught on the North River at Hudson.

**MOVEMENTS OF THE FISHING FLEET.**—The number of fishing arrivals reported the past week has been 9, viz.: 3 from the Banks, bringing 30,000 lbs. cod and 36,000 lbs. hal

2 from New Brunswick, with fares of frozen herring; 2 from Georges, one with 30,000 lbs. round cod, and the other with 16,000 lbs. split cod and 5,000 lbs. halibut; and 2 from cod-fishing trips eastward.—*Cape Ann Advertiser*, Dec. 28.

**THE GLOUCESTER FISHING LOSSES OF 1877.**—The year 1876 was a remarkably disastrous one; twenty-seven Gloucester vessels of a value of \$150,000, and 212 seamen were lost. This year has been one of almost unprecedented freedom from loss of life and property. The losses of seven vessels aggregate a value of \$23,936, and the total loss of life has been thirty-nine men.

**CONNECTICUT—Lakeville, Dec. 28.**—A pickerel of two pounds weight was taken here Dec. 22 on a spoon hook from boat.

W. H. W.

**FLORIDA—St. Augustine, Dec. 25.**—Fishing is now good. Sheepheads are biting voraciously at Matanzas. Fishermen at the St. Sebastian bridge report the sport excellent.

**AN ADVENTURE WITH A SALMON.**—My friend, Mr. Robert Mead, having given me permission to fish the Finn River, which he has leased from Mr. Styles, the popular lord of the soil, I started for Killecock Glebe, Stranorla, the residence of my brother-in-law, the Rev. Charles Jones, for a week's salmon fishing. My first day proved successful, having killed two good fish. The next day was a blank, "rain overhead," or some other unaccountable cause preventing the fish from rising. Having decided on making an early start next morning, six o'clock saw me on my way to my favorite pool, which is just above what is known as the "broadcast," and not three hundred yards from the Glebe. Just as I came opposite the pool I saw a fish rise. At this time it was raining, and there was every appearance of heavy rain up the mountains. I got all ready to have a cast over the fish; but, on going to the bank, I found the river running strong between the bank and the rock, from which alone you can fish the pool. However, I was not going to be deterred by wet feet; so over I went. I had not taken many casts before I was in the fish, and it soon became evident that he was a good and game one. Whilst I was playing him I remarked that the water was rising fast, and from time to time I had to move higher and higher on the rock; and, bearing in mind the reports I had heard of this river rising "six feet in ten minutes," knew that, unless I had brought matters to a speedy conclusion with my friend, that I should either have to take up my abode on the rock for twenty-four hours or swim for it, which was no pleasing alternative. So monished, I put on additional strain and gave my friend the entire weight of the rod and not an inch of line. It was wonderful how the casting-line stood the strain; however, I had no time to be particular. My fish should either come or go. The strain at last began to tell and I felt him yield somewhat. Inch by inch I brought him to the top, but only for a moment, when away he went again, and at it we were as fresh as ever. All this time the water was rising fast and furious. Again he yielded, and up his head came, showing some signs of fatigue. To the rock I brought him, and, with gaff in hand, I stooped to give him the coup de grace; but he was too quick for me. Away he went again like a flash of lightning, rushing into the rough water, where he took one heavy tumble, and snap went my cast. For a moment the fish remained on top of the flood as though stupefied, and the next he was gone. If my friend was off and not landed, I had the same story to tell, for I also was off and far from being safe landed. Having now time to consider and realize my position, I found it not at all an enviable one. I was twenty yards from the bank, the river rushing and hissing all round me, and no one near to give me aid should I require it. I decided at once not to remain on the rock to be swept away, but to swim for the bank, and at once. My chief anxiety was how I should get my watch over safe and dry. I took it out of my pocket and placed it in my hat; but, on looking at the torrent, I came to the conclusion that I could not keep my hat on in such water. Having come to this conclusion, I proceeded to undress, rolled my watch in my vest, my vest in my coat, both in my waterproof, and placed all in my fishing bag, which I strapped well round with the belt. I then took down my rod, secured my salmon line to the strap of the bag, and, having paid out sufficient line, I cast the reel to the bank, and thus, as I hoped, had secured a safe way of getting my watch, etc., safe to land. Having shied across my boots, it now behooved me to look out for my own safety. About mid-channel there happened most fortunately to be a large rock. This formed a sort of eddy, or back current. I saw that this was my only chance. If I could get to this rock I was safe. Accordingly I went as far above it as I possibly could, and the next moment I plunged into the river, and was swum like a cork beyond the rock, having failed to catch it in p.-sing. However, two or three strokes brought me into the back water, and then I had no difficulty in reaching the rock. Once on it all danger was over, for I knew I could swim to the bank from it. Having rested for a few moments I went again, and after a short and hard struggle, I found myself within reach of a friendly branch of a tree, and the next moment saw me safely landed. Now came the question how to regain my watch and clothing. To run to my room, put on dry clothes and return, was only the work of a few minutes. This time I had the assistance of my nephew. When I came to pick up the reel and pull over my parcel, you cannot conceive my chagrin and anxiety when I found the line had got foul in the branch of a tree, so that I could not get a pull at the parcel on the rock. Fortunately we had brought another line with us. To this we tied a stone so as to cast it across the bundle the moment it left the rock, which we expected it would do each moment. We were not kept long in suspense, for the water soon rose and carried it off. The moment it moved we had the line across, and proceeded to pull in to the bank with every hope and prospect of success; but the river proved too rapid, and the moment the strain came on the line, snap it went, and off went my bundle, watch, chain and all. For a few moments we kept it in view, but down the river it went like a race-horse, and we could now do nothing but deplore my loss, which I estimate at upwards of £10. I was told by many that I would recover all, and that it could not go far; but any one who saw it rushing down the river would come to a different conclusion. Soon the news of my adventure and loss spread, and, having offered a reward of £5, half the country were on the river banks next day, but until the river fell there was no chance of finding my property. It was at 7:30 A. M. on the 5th inst., that the parcel was swept away, and at 8 o'clock this morning it was found by a man of Sir Samuel Hayes', named Kee, at Drumboe, a distance of five miles from the starting-point. The watch appears nothing the worse for the journey.—*London Field*.

## Game Bag and Gun.

### GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Powl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, snipe, phalaropes, avocets etc., coming under the group *Limicola*, or Shore Birds.

**MASSACHUSETTS—New Bedford, Dec. 28.**—The warm weather kept the game birds in the upland woods, and of course when every tyro, as well as veteran could get a shot at them. As result for the last fortnight birds have been very scarce, but hares and rabbits plenty in this vicinity. A flock of wild geese passed over last week (Dec. 22), denoting warm weather north of us.

CONCHA.

**Salem, Dec. 26.**—Since last accounts there has been little done with the gun. There is a sportsman's club at Lynn, which is quite active. They have glass ball shoots more or less each week at the base ball grounds. Some good shooting is done by Messrs. Loud, Holbrook, Nichols and others. Some rabbits have been shot in Ipswich. A large flock of geese flew in the outer harbor a few weeks ago. Goosanders, old squaws, etc., are reported as quite plenty off the upper end of Plum Island. Gulls numerous. An accident recently occurred in Jamaica Plains worthy of note. A partridge flew into the window of a house, and after flying around lively, evidently bewildered, was finally captured, and went the way of all good partridges. This, in a section tolerably well settled, must be owing to some misunderstanding in the *B. umbella* family.

TRAIL.

**CONNECTICUT—Lakeville, Dec. 28.**—I send you record of one on two rather unusual "takes" for this season of the year: Dec. 21, shot a cow blackbird (*Molothrus peccati*) out of a flock of perhaps a dozen. Dec. 28, Wilson snipe shot near here by C. M. Turner. With regard to ruffed grouse, we close the season with a score of twelve hens out of about 175 birds shot, showing a slight increase in the proportion of hens in the birds killed for the last two or three weeks, and with more birds in our immediate vicinity than at the opening of the season, they having come off from the mountains in sufficient numbers to more than make up the list of "casualties."

W. H. W.

**NEW YORK—Dunkirk, Dec. 29.**—It is worthy of mention that our principal hunter here sums up his fall work as follows: Two hundred partridges, 100 plovers and red squirrels, a large number of rabbits and four red foxes.

E. B.

**PENNSYLVANIA—Pottsville, Dec. 24.**—Within the past three weeks our fields and forests have become well stocked with pheasants, quails, wild turkeys, and rabbits. A deer is now and then brought in town. Our market is stocked with all kinds of game, which commands a ready sale at advanced prices.

DOM PEDRO.

**VIRGINIA—Stafford, Dec. 21.**—Wild turkeys have been numerous that they have been for many years, and large numbers have been killed. In one day fourteen were bagged by Mr. Thomas Bullock, a gentleman living a short distance from Falmouth.

**Page, Dec. 21.**—William Barran, last week, at one shot killed three wild turkey gobblers, each weighing eighteen pounds. They had beards that measured ten inches in length. They were deced within a few feet of the blind where Mr. Barran was hid.

**Lunenburg.**—A correspondent of the Richmond *Whig* writes from Lunenburg: There are more deer in this county than have been here for half a century, and the sentiment of the people is opposed to their being hunted or shot at present. But they never can be exterminated as heretofore if the law is rigidly enforced. Extermination comes by aid of the snow, and as the law lets down on the hunters the 15th of this month, there is rarely snow enough before this time to do damage. I was down in the lower end of the county about ten days ago, east of Flat Rock. The Messrs. Neblett and Major Stokes were out with their splendid pack. The fox was up, and I never heard more splendid running.

**Piedmont, Dec. 20.**—The Virginian records the success of a hunting party, composed of Messrs. Howard Reveley, Thomas C. Reveley, Thomas Winslow, E. W. Williams, and R. C. Grymes, who camped in the wilderness in the lower part of the county, for an old-fashioned hunt. Between Monday and Saturday they had succeeded in bagging fifteen turkeys, supposed to be wild; ten pheasants, and forty-nine rabbits, or old hares, as they are sometimes called. The party report deer as being quite abundant in the wilderness this season.

**SOUTH CAROLINA—Charleston, Dec. 23.**—Several parties spent Christmas in the woods and found sport first rate. Our company bagged two deer, wounded two more, but lost them. A fine fox chase was a feature of the day. Some good bags of birds brought in.

EXNOTS.

**MISSISSIPPI—Corinth, Dec. 26.**—Weather has been too warm to shoot much; have made some small bags of quails. Dr. P. killed two fine gobblers—right and left—one day last week. Squirrels numerous in the bottom. Five or six of our sportsmen are off to-day, for the pine hills, after deer and turkey.

GRYON.

**OHIO—Greenville, Dec. 27.**—Game in this vicinity plenty. Farms posted, but sportsmen have little difficulty in securing permission to shoot. The following bags have been made: Dec. 4 to 6—N. Nelson, 86 quail; Dec. 9 to 12—J. Clave and E. Hawfaugh, 205 quail, 9 pheasants, 9 rabbits; Dec. 14—48 quail and 3 pheasants for two men; Dec. 20 to 25—56 quail for 3 men; Dec. 20—54 quail, 6 rabbits, one red fox, to one man.

NEMO.

**COVIER CLUB.**—We are indebted to Hon. Thomas A. Logan, secretary of the Cuvier Club, of Cincinnati, for an invitation to the Fourth Annual Reception, Jan. 1st. We content ourselves with a hearty New Year's greeting to all the members.

WISCONSIN—Watertown, Dec. 28.—I have it from several of our citizens that Saturday, the 22d, they saw not only robins, but two flocks of wild geese going north, besides a number of ducks. S. S. W.

COLORADO—Denver, Dec. 22.—A band of from four hundred to five hundred elk were, at last accounts, ranging near the head waters of the Troublesome River, some fifteen or twenty miles from the West Sulphur Springs, in Middle Park.

CALIFORNIA.—A correspondent at Yuba City, Sutton Co., says that section affords advantages and opportunities for shooting wild fowl second to none on the globe.

A NOVEL CAPTURE OF BRANT.—“Two years ago old man Cole found two flocks of brant fighting each other on his island—a very muddy place. The fight was so severe that the plucky fellows were completely besmeared with mud, and unable to fly away on the approach of Cole and his two daughters. They caught nearly a hundred, and took off the first joint of the wing. He now has brant by wholesale.” This story came from a responsible person. ARROW.

[And these birds, bespattered with the mud of internecine war, are the same whose notes are heard, high in the stilly air of night, by the poet. What a fall, from the cerulean vault to a duck-coop; from poetry to mud!]

STILL THEY COME.—From every part of the United States and Canada, from North and South America, from the West Indies, come in the answers to our puzzle, more numerous than all the blackbirds that ever flew, or squirrels that scuttled up hickory-nut trees, or woodcock that flittered in the thickets. The worst of it is, that everybody hits it; the answers are all correct. The problem is solved in an infinite variety of ways. Algebra is wrestled with, and fluxions, logarithms, coefficients, multiples, surds, calculi, differentials and aliquot parts, are overhauled, computed, supputed and made subservient to the blackbirds, squirrels and woodcock. If addition, subtraction, multiplication, division, involution, evolution, differentiation or integration ever made anybody happy, we are those persons. The only person who is not serene is the office boy, who groans under the weight of the mail. Never more will we do such a thing, until we hire a Lady Sphinx as part and parcel of our editorial corps, then look out for a difficult problem.

The answers have, however, a real practical use, whether by accident or design, and it is very hard to fool with numbers—the results show true sportsmanlike details. Blackbirds are shot in flocks. So 3 shells to kill 48 blackbirds are not out of the way, you have to take individual pops at the squirrel, and a fair shot ought to kill a squirrel at every fire, unless he falls in the crutch of a tree. But as to the woodcock, ahem! Ten shells for each *Philohela minor* cannot be called very good shooting. Now, as a shell costs on an average 5 cents, next time we buy a woodcock and have to pay 75 cents for him, recollecting that it took ten 5-cent shells to kill him, we shall put down our money without a grumble. Yes, numerous kind friends, the answer is—well, suppose we give it in poetical form:

Eight and forty blackbirds sitting on a hill,  
Bang went three shells, and did all the kill.  
Seven and forty squirrels sporting on a stump,  
Bang went 41 shell, and hit 'em in a lump.  
Then a muf! he went, with an old dink-lock,  
And he wasted fifty shells on five woodcock.

BIRDS FOR TRAP SHOOTING.—In reply to numerous questions as to where birds can be had for trap shooting, we have to say that there is nothing reliable as to the purchase of pigeons for trap shooting in New York. The best that can be done is to apply to the poulterers in Fulton and Washington Markets.

GUN TRIALS.—As we have been asked to give the method employed for testing guns we reproduce that used at the Chicago gun trial in 1874:

All the guns were fired from a frame, the heel-piece of gun set 40 yards from the target board, which was a square surface of pine one inch thick, supported by two upright pieces of pine two by four inches thick, set three feet in the ground and firmly braced. On this target board was clamped a sheet of strong manilla wrapping paper, having described on its exposed surface a circle 30 inches in diameter. In the centre of this circle, and pressed firmly against the target board, was placed the penetration pad, which was composed of 40 thicknesses of heavy brown paper, full sheet 48 by 60 inches, 380 lbs. to the ream, cut and pressed by book-binders' press and the edges of each pad glued firmly together, the size of each pad being 9 by 10½ inches, and each pad weighing 13 ounces and 5 drachms avoirdupois. In ascertaining the result of the firing a 30-inch circle was made. In the middle was a square called the central pad, and the rest of the circle was divided by a perpendicular and horizontal line, each part being called respectively: Central Pad, Right Upper, Right Lower, Left Upper and Left Lower quarters of the circle not covered by the central pad; or C. P., R. U., R. L., L. U. and L. L.; the letters Pen. signify penetration. In determining the penetration the last leaf of paper in the pad broken by a single shot is counted. The shot used was No. 7, 4,954 pellets per lb. avoirdupois, 309 10-16 pellets per oz. actual count. Charge of shot for all guns 1 oz., measured by Dixon dipper, No. 1,106, and struck off. Powder, Dupont's "Eagle Ducking," No. 2, charge 4½ drs. for 10 bore guns, 4 drs. for 12 bore guns, and 3½ drs. for 16 bore guns. In addition to the three rounds fired with graded charge of powder for different bores, one round from each gun was fired with a uniform charge of 4 drs. of powder and 1 oz. of shot measured as above. Eley's blue shells were uniformly used.

—J. C. Grubb & Co., of Market street, are the Philadelphia agents for the Nichols & Leferer breech loading guns.

CAPTAIN A. H. BOGARDUS.

CAPTAIN BOGARDUS.—Capt. Bogardus, who shoots today at Gilmore's Garden, and whose proposed performance of breaking 5,000 glass balls in 500 consecutive minutes, loading his own gun, has never been attempted before, is well known, both in this country and abroad, as a most remarkable shot. In an exceedingly interesting work, written by Capt. Bogardus, entitled "Field, Cover and Trap Shooting," the Captain thus speaks of himself, and how he commenced at fifteen to handle a gun:

"I was then a tall, strong lad, and have since grown into a large, powerful, sinewy, and muscular man. I have always enjoyed fine health, had great strength and endurance, and been capable of much exertion and exposure. When I began to shoot, there was a good deal of game in Albany County, and it chiefly consisted of ruffed grouse and woodcock, which are difficult birds for new beginners. I received no instructions from anybody, but I possessed a quick, true eye, and steady nerve, and had, as I believe, the natural gifts which enable a man to become in time, with proper opportunity, a first-rate field shot. It was a long time after that before I ever shot at a pigeon from a trap, and I confess that I had for many years a strong prejudice against that sort of shooting. There were no quail, snipe, or ducks about Albany County at that time, and it was not until I removed to the West that I became familiar with them and with the pinnated grouse. Seventeen years ago I moved to Illinois, and settled on the Sangamon River, near Petersburg. It was more a broken, swampy country, with much cover, than a prairie land like that to the northwards in the State. Game of all sorts was in vast abundance. There were vast numbers of quail; the pinnated grouse were rather numerous, though nothing like as much so as upon some of the great prairies; ducks and geese came in immense flocks every spring and fall, and deer and turkeys abounded. It was, too, and is to this day, one of the best places for snipe that I know of. It was a paradise for a sportsman; and as for the snipe and quail, there was hardly a man who could kill them except myself. Lots of men used to go out to see me shoot. There was one, a great hunter of deer and turkeys, with whom I became very intimate. At first he laughed at me when he saw me loading with No. 8 shot. 'That wunt kill nothin', stranger,' said he. 'What little I do to at quail I do with No. 1 shot, and for prairie chicken I always use BBs. You can't stop 'em with anything lighter.' But he changed his opinion when he found by experience that I could kill ten to his one, and then it was the old story of the fox and grapes. 'Darn the little creatures, I say!' he exclaimed; 'I got no use for 'em anyhow!' At that time I used to stint myself in quail-shooting time to twenty-five brace a day. When I had got them, I gave over for the day."

Capt. Bogardus became first noted as a pigeon shooter in 1863. In 1860, in a match against time, Capt. Bogardus to kill five hundred pigeons in six hundred and forty-five minutes, he won the match, having an hour and fifty-seven minutes to spare. On the 21st of October, 1869, he accomplished the wonderful feat of killing one hundred birds straight. Capt. Bogardus is the winner of innumerable badges and medals. A feat in the field which one reads of, but which Capt. Bogardus has been known to accomplish, has been to kill a grouse with each barrel as the pack rose, and, slipping in another cartridge, to kill a third bird out of the same pack.

Of late Capt. Bogardus has devoted a great deal of atten-

tion to glass-ball shooting, and has given rules and regulations governing this most pleasant amusement. In the new edition of Capt. Bogardus' book, to be issued shortly, will be found the rules for glass-ball shooting. Capt. Bogardus' style of shooting is quiet and easy, even deliberate. He seems to get his aim intuitively, and to find the exact moment when to discharge his piece. Never flurried nor excited, though his movements are neither mechanical nor automatic, still there is an impassiveness about the Captain which is quite remarkable. Birds or balls rise, a gun is fired, and the bird falls, or the glass ball is broken into fragments. Should the Captain succeed in accomplishing the feat he proposes at Gilmore's Garden, it will become one of the most noted events in the annals of shooting. It will prove three things: Firstly, the endurance of the man; second, his wonderful skill; and, lastly, the perfection of the modern system of arms.

HOW CAPTAIN BOGARDUS LOADS.—In his match against time at Gilmore's Garden, Captain Bogardus will change every fifty shots from his ten to his twelve-bore. In the twelve, 3½ drs. of Dittmar's powder are used; in the ten, 4 drs. The charge of shot is 1½ oz. No. 8 for the ten, and 1½ oz. for the 12. In the field rather more powder would be used.

#### A CHALLENGE TO GLASS-BALL SHOOTERS.

SAN FRANCISCO, Cal., Dec. 12, 1877.

I will wager from \$250 to \$500 that I can beat any man in the world shooting the following eight matches, or any one of them: First, I can break more glass balls thrown from a Bogardus trap, 25 yards rise, than any man in the world; 2d, I can break 1,000 glass balls quicker with a shot-gun than any man living; 3d, I can break more glass balls shooting from a horse's back, the horse to be on a run, 21 yards from the balls, than any man in the world can break, 80 yards, and stand on the ground; 4th, I can break more glass balls with a rifle, the balls to be thrown into the air, than any man in the world can break with a shot-gun and shoot 30 yards, using a Bogardus trap; 5th, I can break 100 glass balls quicker with a Winchester rifle than any man in the world can break them with a shot-gun; 6th, I can break two glass balls thrown in the air at the same time, making a double shot and loading the gun once while the balls are in the air, using a Winchester rifle; 7th, I can make more fancy shots with a rifle than any man in the world; 8th, I will wager \$1,000 that I can kill more buffalo in one run, shooting from a horse's back, than any man in the world, and if buffalo are not to be found, will shoot elk, and go on the prairie at any time.

DR. W. F. CARVER, San Francisco, Cal.

[From what we have heard of Dr. Carver, we are led to suppose that he is a very wonderful shot.—Ed.]

TO CLEAN METAL SHELLS.—It is an awful nuisance to make a shell clean inside, and though simple when you look at it, is much harder to do than you think for. Now there is a handy little tool of which Mr. J. T. Ronan, of 778 Shawmut avenue, Boston, is the maker, which works on shells like a charm. The Ronan shell cleaner can be used as a breach wiper. Why sportsmen should have verdigris now in their old shells we cannot see. In ten minutes fifty shells can be made as good as new by using the Ronan shell cleaner.

Diamond Badge score; English rules, 30 yards rise, 80 yards boundary, 5 ground traps:

\* Killed with second barrel.

**THE BOWERY CAT SHOW.**—The enterprising managers of the American Museum, "the greatest 15 cent show on earth," have added to the attractions of the fat people, "wax figures," "Inquisition horrors, and other objects of curiosity and wonderment, a vast and various assemblage of cats. There are cats with two legs, and cats with six legs; lap-eared cats, and one-eared cats; cats double headed, and cats ring-tailed; black tom cats and albino tabby cats; cats yellow and cats green; big cats and little cats, fat cats and lean cats, and whole families of cats of every degree of beauty and monstrosity.

**WHO OWNS THE TURKEYS?**—Some four years ago Mr. Jacob Pentz presented to the Birding Grove Park Association three wild turkeys. The birds were placed in the association's preserves, but ungraciously and inconveniently vacated the ranch. They have been seen at times in the surrounding country and have just been heard from, some sixty strong, in the mountains fifteen miles from the park, toward Scranton. And through **FOREST AND STREAM** the braves of the tribe wish to say to those gentlemen who claim their drumsticks, that if any member of the association wants his turkey let him come and get it. As for them, "These mountains shall fly from their firm base," etc.

**CALENDARS FOR 1878.**—Lang & Robinson, flour dealers, 2 and 3 South street, New York, have issued beautiful illuminated calendars for the New Year. We have also received an artistic calendar from M. B. Brown, general printer, 201 and 203 William street.

## THE COUNTRY,

A weekly journal, devoted to the Kennel, Shooting, Fishing, Fox Hunting, Archery and other outdoor sports. Has also departments treating of Natural History, The Garden and Poultry, Pigeons and Pets. Edited by Wm. M. Tieston, 1st associate editor of **FOREST AND STREAM**. Subscription price, \$3 per year. Specimen copies free. Address, "THE COUNTRY PUBLISHING ASS'N," 33 Murray street, New York.—[Ado.]

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

**137** A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

**138** By an inadvertence many answers to correspondents were left over last week.

**J. F. S., Philadelphia.**—P. Mullin's address is 97 Fulton st., N. Y.

**H. W. H., Lawville.**—Address G. B. Eaton, Jersey City Heights, N. J.

**O. K., Boston.**—The maker you mention is in good repute and he manufactures an excellent arm.

**E. J. P., Painesville, Ohio.**—Address Mr. S. B. Dodge, 351 Broadway, New York, and at Crystal River, Florida.

**H. W. M., New Rochelle.**—We send to your correspondent the form for organization of such a game protection club as you desire.

**C. H. M., Rockville, Conn.**—Where can I procure Black's patent cartridge vest? Address Schuyler, Hartley & Graham, New York.

**BIRD SHOT.**—What would two pure bred greyhounds, dog and bitch, cost? Ans. The right kind would be worth something like \$100, and hard to get.

**Boston.**—Is there anything I can use besides areca nut for tape worm in dogs? Ans. Kooso and male fern are supposed to be effectual remedies.

**B., Greenville, Pa.**—Where can I procure the skin of an elk? Ans. Address Mr. Baldwin, fur dealer, Third st., near Merchant's Hotel, St. Paul's, Minnesota.

**E. B. G., Elmira.**—1. Where can I procure a harrier pup? 2. Would it be the best kind of a dog for rabbits? Ans. 1. Advertise in F. and S. 2. An excellent dog.

**JACK, Boston.**—Have a nickel collar which makes my white dog's neck dirty; what is the reason? Ans. If it is fully coated with nickel it ought not to tarnish. Cover the metal collar with leather.

**J. G. R., Boonton.**—Where can I procure a few hundred live quail during the next two months? Ans. Very hard to get. Apply to Robbins, Fulton Market, or to Reiche Bros., Chatham St., N. Y.

**Doctor, Yonkers.**—The queer skate-shaped fish referred to some weeks since as having been captured and exhibited in Yonkers at the fish market of William Jones was the *Lopholaimus americanus*.

**LEROY, Cin.**—My setter pup six months old has cough, eyes inflamed, with discharge from them, have given sulphur. Ans. The puppy has distemper. Follow directions in "Sportsman's Gazetteer."

**N. S. M., Rutland.**—Is the doubtful shot on the target we send you on the black or bull's eye? Ans. We decide that the doubtful shot is not on. A shot, to be on, must break the paper, split it, or not count.

**J. H. M., New York.**—What quantity of powder and number of shot will I require to load a breech-loading shot-gun 12 gauge and 7 and 10 pounds weight for snipe, quail, or woodcock. Ans. 3½ drs. powder, 1 to 1½ oz. shot No. 10.

**C. F. S., Brooklyn.**—As far as we know, it is honest, though, at all times, such things have, somehow or other, a taint about them. There are responsible people outside of it, but then, the true inwardness always evades examination.

**A. A. B., Oswego.**—A bet B that in England a premium is paid for killing sparrows, and that the person so killing them can have the premium applied to paying his taxes. Ans. A has lost, there are no such foolish things done in England.

**J. H. W., Fort Wayne.**—Can you give me the pedigree of "Major," who was owned by a Mr. King about ten years ago? Ans. Have made inquiries from leading sportsmen in the State, but they don't know. Address L. H. Smith, Stratford, Canada, who has our book of pedigrees.

**A. O. P., Mt. Pleasant.**—The Tolley Mr. Squires has to sell is a 10 bore 30 inch, Damascus barrels, weight 9½ pounds. Extra barrels 10 bore 30 inch, laminated steel, weighs 9 pounds. Side lever, beautifully engraved, and is of Tolley's best make, and never was imported under \$300.

**C. G. J., Howell.**—1. Do wire cartridges injure the interior of fine guns? 2. Are they made of all sizes, and ought they to be purchased in reference to the size of the bore? Ans. 1. They do not, but should not be used for choke-bore. 2. Of all sizes and make for various bores.

**PEEKSKILL.**—What is the best work published in this country on insects? Is Currier's classification much used? Ans. Send to Estes & Lauriat, Boston, Mass., for the works of A. S. Packard, "Guide to the study of Insects," "American Entomology" and "Relation of Insects to Man."

**B. A. M., Stewartville.**—Would not advise the purchase of the revolver, though they are fairly reliable at the distance you mention; but for general sporting purposes it answers quite well. There are inconveniences, not of power but of mechanism, which render revolving arms (not pistols) objectionable to-day. Magazine loaders have taken their place.

**H. D. P., N. Y.**—1. Where can I get pads? 2. Where can I find table of penetration? Ans. We certainly replied to you some weeks ago. Pads can be had of Messrs. Fowler & Fulton, 300 Broadway, or of Mr. Squires, No. 1 Cortlandt st., N. Y. 2. Mr. Squires, if he has the "Field Gun Trials of 1875," and could spare you a book, you could find the necessary information.

**G. A. E., N. Brookfield.**—Do you think the flesh of the ruffed grouse could be poisoned by eating laurel buds? Was there ever a case of the kind? Ans. In hard winters with heavy snowfalls, when little other food can be obtained, the ruffed grouse feed principally on laurel buds in the swamps where they seek shelter; and persons eating of their flesh at such times are very liable to be made sick.

**GROUSE, Meadville.**—Please prescribe for my puppy four weeks old. Think he has the mange caused by being in a litter of thirteen puppies and the bed not being changed for four weeks. He is broken out on the legs and back and matter crusted on his hide and hair. How shall I diet him? Ans. Keep in a clean, dry bed and rub in a little kerosene where there is any eruption. Feed him boiled oat meal or mush.

**G. N., Fisherville.**—Have a rifle, 40 cal., 50 grs., 30 in. barrel. It shoots admirably at 100 yds., but over that distance the balls will not get on the target. The rifle is highly finished and excellent in every way. Pray inform how I may remedy the trouble. Ans. Perhaps the twist is not sufficient to impart a permanent rotary motion over 100 yards. Suppose you try a shorter ball, or if not shorter ball more powder.

**E. B. G., Montreal.**—How can I remove rust from the outside of a gun barrel? Ans. Lubricate the part well with an animal or fish oil. Let the oil remain for some several days. Then take a fine scratch brush and work carefully. Of course rust can always be removed, but sometimes at the expense of making a blemish on a barrel, but it is always better to use the heroic method and get rid of it, because if left rust eats its way to the metal.

**C. M., Dauphin.**—How can I dry fern leaves so as to preserve their color? Ans. Take dry sand, and place the leaves on the sand, then sift a layer of an inch or so of sand on the leaves—of course arranging the leaves flat and neatly. By doing this carefully, not only leaves but flowers can be preserved. Let the whole remain until the leaves are dry. Of course, keep the sand in a moderately warm room, such as one's living room.

**IRISH SETTER.**—1. Describe the color of a red Irish setter? Are they ever white? 2. Where can I get California quail? Ans. 1. Blood red, a deep chestnut, mahogany color—not golden, nor fawn, but a frank, deep blood-red is the color of a red Irish setter of high breed. Irish judges consider a black tipping of the coat a grave fault in color. Yet Stonehenge says, "There are good Irish setters nearly white, red and white." There were famous Irish setters, white and red, as far back as 1592; still, in our judgment, a red Irish setter ought to be red, and nothing else. 2. Address Reiche Bros., Chatham st., N. Y.

**E. P. H., Stroudsburg.**—Please give description of a full-blooded black and tan setter, and whether they have short hair? Ans. The black of a Gordon should be raven black; the tan, a rich red. There should be no yellow or tawny, nor fawn. The cheeks, lips, throat, feet, back of forelegs to the elbow, front of hind legs to hips, belly, inside of thighs and underside of ears should be red, with a large spot over the eyes. Hair of moderate length, and perhaps, generally not as fine and silky in texture as in high bred English setters. Hair often with a handsome waviness, but not curling.

**R. G. L., Franklin.**—1. Please give me address of a reliable party that is considered a good dog breaker or trainer? 2. One living nearest this place desired. 2. Will choke-bore shoot Kay concentrators and wire cartridges with as good effect as cylinder barrels? 3. Are wire cartridges injurious to choke-bore? Ans. 1. Do not know of any. 2. There would be no necessity for them. Choke-bore are supposed to do away with peculiarities of ammunition. 3. Should think it would be injurious.

**W. H. D., Baltimore.**—What is about the average weight of bluefish caught on the Atlantic coast? What was the weight of the largest blue fish known to have been caught in New York Bay, or off Sandy Hook? Ans. There are several runs of bluefish from the beginning to the end of the season. In May the average weight is seven pounds; in June three pounds; in July a quarter of a pound, growing to half a pound in August. In October they run from twelve to eighteen pounds, the latter weight being the heaviest that we have personal knowledge of.

**E. M., St. Paul.**—1. I have a 16-bore breech-loader; am at present using common straw-colored shells; what should be the proper amount of powder and shot for common bird and quail shooting? The gun is light—total weight of barrel and stock is 17 lbs. 2. Can you recommend

me a good dealer in shells, etc., who has No. 16 shells for sale? Ans. 1. From 2½ to 3 drs. powder and 1 oz. 9 or 10 shot, perhaps for your section of country. 2. Schuyler, Hartley & Graham, or Squires, or Fowler & Fulton, all of New York.

**J. A. W., Richmond.**—Have a fine pointer pupped in May of last year. He is badly off with distemper. No cough, but loss of spirits and appetite. Very poor, thin and timid. Vomits, bowels loose; hair lustreless and skin tightly drawn. Ans. Difficult to properly prescribe without seeing the dog, but two grains of quinine four times a day, tincture of opium five drops three times a day as long as the bowels are loose, good strong broth of meat and a warm, dry bed will, at this stage of the disease, probably pull him through.

**T. O. M., Harrisburg.**—On Dec. 20 my setter dog, apparently in good health, commenced to gag and throw up a silny, striggy matter. Since then he has eaten nothing. His stools are the same color and like what he threw up. He drinks water, but will eat nothing. Has not fallen away any, so far. Gets into dark corners and is very reluctant to come when called. What is the matter, and what shall I do? Ans. Probably has an attack of gastritis. Give only milk and water for a time.

**G. S. W.**—1. What is the price of Greener's book on choke-bore? 2. Is the — breech-loader considered a good gun? 3. Is Hazard's F. G. sea shooting a good powder to use for a B. L. 7? 4. Is a coarser powder better for shooting? Ans. 1. \$3.50. 2. Very fair. 3. None better. 4. The tendency is to use coarser powder. A slower burning powder strains the gun less, gives a diminished recoil, and produces, at less cost, excellent effect. The powder you use has the advantage of a good glaze, which prevents its becoming moistened.

**C. W., Brooklyn.**—1. Does the \$4 for subscription to the F. & S. include postage? 2. How could a slight trembling of the barrels be remedied, and what would it cost? 3. What would be the cost of altering a forward-side lever to back-side lever, i. e., back of the right-hand hammer? Would this prevent the shaking? Ans. 1. Four dollars includes everything. 2. Exceedingly hard to tell, unless we saw the gun. 3. Think the remedy would be found in the change, but could not tell the cost. Would be glad if C. W. showed us the gun in person, in order to advise further.

**PHILADELPHIA.**—1. What game is there in the upper part of West Virginia? 2. What calibre of rifle is most suitable for shooting squirrel, wild turkey, etc., and what make should I get? 3. What kind of dog should I have that has always to keep with the shooter, and whose only duty would be to bring the game that has been killed on land or water, and what would such a dog already trained be worth? Ans. 1. Deer, bear, wild turkey, quail, ruffed grouse, squirrels, otter and mink and fox (see Hallock's "Sportsman's Gazetteer"). 2. 35. 3. A retriever. Would cost from \$25 to \$50.

**J. G. A., Ithaca.**—1. Please inform me if a wad and disc of grease over the powder is better for general hunting and target shooting with a patched ball? 2. What is the highest score (5 and 10 shots) ever made at 200 yds? 3. Is the putting of dozen consecutive shots in a space of ½ in. diameter with a .22 cal. rifle 100 ft., spoken of in your last number authentic? Ans. 1. It would be an advantage, almost a necessity, if you did not wipe out. 2. 24 points in 5 shots, 47 in 10; these are absolute scores, winning matches, and recorded, not—hearsays. 3. We have every reason to believe it was authentic, and wonderful shooting was it.

**C. H. C., New York.**—1. Have an imported setter and wanted to breed from him. Do you know of any one having a good bitch? 2. What is the best work on rearing, etc.? 3. Is there a probability of glass ball practice being established in the city? 4. Have —, Dublin, a good reputation as gunmakers? 5. My dog's hair comes out quite badly and looks rather rough, from his shoulders to his tail. Skin appears all right, no inflammation or eruption. What shall I do for him? Ans. 1. Advise and we are quite certain it could be arranged. 2. Stonehenge, Ithaca, "Sportsman's Gazetteer." 3. There is. We shall announce it shortly. 4. Very good reputation. 5. Give a little sulphur two or three times a week and afterward a dose of castor oil.

**J. M., West Meriden, Conn.**—1. Will you be good enough to inform me where I can purchase the bamboo that fly-rod makers use in making their rods? 2. Can partridge, called pheasant in Pennsylvania, be shot during the first month of the year? 3. Is there any good wild turkey hunting in the neighborhood of Wilkes-Barre, Carbonate, or Pittston? 4. Can they be shot during January without trespassing on the law? 5. Any fishing to be had in the places spoken of above, for bass in January? Ans. 1. Fersherne & Co., Canal St., N. Y., import bamboo and lancewood. 2. The close season for pheasants is from Jan. 1 to Oct. 1. 3. You will find turkeys in that region, although not in the immediate vicinity of the towns named. 4. They cannot. The close season is from Jan. 1 to Oct. 1. 5. You will find speckled trout. The close season for trout is from Aug. 15 to April 1. Black bass fishing permitted until March 1; close season from March 1 to July 1.

**J. O. W., Tounah.**—What is the difference between Remington Creedmoor and Remington Sporting Rifle, No. 1? What is a Creedmoor rifle? Ans. A Creedmoor Remington is a special arm adapted to long range shooting. Our manufacturers, such as Remington and Sharps, both make what they designate as Creedmoor rifles. A Remington sporting rifle, No. 1, could be used for match shooting at short ranges, but would not be useful at the extreme ranges. Creedmoor rifles have delicate sighting apparatus, water levels, verniers, and for the finest and most accurate shooting, must be cleaned after every fire. A Creedmoor rifle is good of course for all distances. With certain precautions in its use, a Creedmoor is to a sporting rifle something like a chronometer to a first-class watch. You could knock about a sporting rifle without injuring it, but not a Creedmoor. The Creedmoor rifle is an arm of absolute precision for all distances.

**B. A. M., Austin, Minn.**—In what States are quail allowed to be trapped? 2. Is there anything to prevent my being a member of a sportsman's club in their regulations, being only 16 yrs. old? 3. Can you give me some information as to taking out powder burns from the inside of my gun, also rust? 4. Is \$25 a reasonable price for a retriever? Ans. 1. Trapping quail is prohibited in nearly all the States at all seasons of the year. Some States, as Illinois and Connecticut, allow trapping on one's own property. 2. We should judge there would be nothing. Its own membership is regulated by the constitution of each club. 3. If powder burns, send to a gunsmith and have it emerald on. For rust use Riggs's Belmontite oil. Also, a thin coating of shellac, dissolved in alcohol, is excellent. Common tallow is very serviceable. Blue ointment is the best preventive, and easily applied by mixing it in sperm oil and passing it through the barrels a few times with a rag. 4. Yes, if the dog is a good one.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting. P. O. Box 1,234.—[Ado.] **ABBY & IMBRIE, 85 Maiden Lane.**

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2332.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 60 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 3, 1878.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,  
Business Manager.S. H. TURRILL, Chicago,  
Western Manager.

**GRAZING RANGE WANTED IN TEXAS.**—A gentleman with \$5,000 to \$10,000 capital wishes to buy a rancho in Colorado or Texas, for the purpose of grazing sheep or cattle. Will buy the whole or join another party. Do our Colorado or Texas friends know of an opportunity? Address the editor of this paper.—[Ado.]

**WHETHER THE FOREST AND STREAM AND ROD AND GUN FETCHES.**—Fetches! It is not an elegant expression, but it means that advertising in this paper fetches business. And why? Because our circulation is constantly increasing, and for the reason that we reach all the sportsmen in the country. An advertiser writes us as follows: "I have been advertising but a short time, but long enough to appreciate the FOREST AND STREAM AND ROD AND GUN as an advertising medium, having received letters from all parts of the country, and even from British Columbia, with any number of letters from officers in the army."

**FLOWERS ALL AROUND, 1877 AND 1878.**—The old year is generally represented as a decrepit fellow—a snow man—all ice-bound and muffled up, while the new year is a gay spring-ald decorated with flowers. This year we think there has been a mistake made about it. When dandelions sprout in December, 1877, we don't see why both the old and the young year should not be garlanded with flowers, and each have a chaplet of its own.

**BLOOMING GROVE PARK RECEPTION AND BALL.**—This much-talked-of affair will take place at the Hoffman House on Tuesday next the 8th instant. It will be a characteristic reunion of sportsmen and their families. Tickets, admitting gentlemen and lady to the reception, ball and supper, can be obtained of Charles Hallock, Esq., office of FOREST AND STREAM, or of any of the other members of the Reception Committee following:

Dudley Field,  
Dr. Geo. H. Glenney,  
Col. Sanders D. Bruce,  
Charles Hallock,  
Joseph Dore,  
E. R. Wilbur,  
O. H. Read,  
P. M. Wilson,  
John Avery.

Dr. E. Bradley,  
Hamilton Busby,  
E. A. Buck,  
A. H. Wellington,  
T. W. B. Hughes,  
Simon Stern,  
M. B. Brown,  
Geo. S. Greene, Jr.,

## THE PHOTOSCOPE.

THERE was a time when the narrator of stories relating to the sports of the field was listened to with a certain amount of attention. "When I was in Bengal"—so would commence the raconteur, "I went up to the country with Colonel Plunger, of her Majesty's Ninety-oneth, and we had a tiger hunt." Here would follow some stirring incidents, and as if to bring authenticity to the recital, the conclusion might have been, "And that skin there, fourteen feet three inches long, from head to tail, you have under your feet, I shot. The biggest brute of the season! In fact, the animal was the terror of Humberwallah." Of course the inspection of a noble skin, with a bullet hole or two in it, settled the matter. Suspicions of a fine hide bought at Gunther's was out of the question. Guileless as we were, it was a pleasure to be imposed upon, when a remarkable yarn, bristling with impossibilities, was supplemented with trophies, photographs and sketches.

But this kind of thing, even with the visible proofs, will no longer be alone of avail in launching a Munchausen. The story of the future must be buttressed with something more than material things.

Next year the man who attempts to indulge in a tough story (outside, of course, of the newspapers) will have to do it something in this way: "It was near the Atlas Mountains, and I was going for lions. Of course I use the plural, though I assure you had I been able to bag one lion I should have been quite contented. It was a quiet moonlight night, and my Arab said to me (here a curious sound is heard in some impossible language), which means, 'Oh, my Lord and Master, here comes the Father of lions; keep your eye skinned!' I got to understand the lingo. I cocked my rifle. When near me, quite near me, I heard (the room here absolutely reverberates with a deep booming) the roar of a lion. Frightened! Of course I was. You see we had tied a kid to a stake, and the poor thing commenced bleating piteously (sounds of ba-a and m-a-a are heard, of the most doleful kind). At last the lion's flank was toward me, and drawing a careful bead, I let him have it (the glasses in the room vibrate with the explosion of a gun). He had it right under the shoulder. That one shot sufficed, for he fell dead in his tracks. My Arab embraced me. That night in the village there was feasting and dancing (a twanging of some string instruments and the monotonous beat of a tambourine sound not unpleasantly). Queer music, is it not? I lost my heart just about that time. Zobaide, the Scheik's daughter—you know. Such a lovely creature! all veiled and bundled up, but eyes that shone like stars! When she lisped out 'Ra-ka-hout, ra-ka-hout'—that's 'Dear Billy' (the fair sound of a woman's voice is heard), it was the sweetest music I ever listened to. Her father, a grim old fellow, all long beard and hollow-eyed, his girdle a perfect armory and arsenal, got wind of it somehow, and said he, ('Gi-touto-atwince-gedi-vil,' is heard). Of course I went. My Arab steed neighed for joy (a loud whinny is heard) and scouring the burning sand—a week afterward I was in Algiers."

Is is the Photoscope, the last electrical invention, which will do this kind of business. The sportsman will carry with him a photoscope, and once catching the sounds, he will be able to preserve them, and grind out the sounds again whenever the occasion presents itself. What delightful anticipations do not the photoscope permit. Our favorite horse has thrown us, and we have a broken leg. Seated in the sick-room, we can forget our pain, as the room rings again with the joyous yelpings of the fox hunt. Pictures alone in the ornithologist's books will no longer suffice. Songs of nightingales we may listen to now, and the deep mysterious booming of the bell bird in tropical forests, just as Whittier has written it,

"A cry as of the pained heart of the wood,  
The long, despairing moan of solitude."

We are to have the harking of the brant in our back parlor, or the gentle peeping of Bob White in the smoking room.

What a revolution that photoscope is destined to play in theatrical business! The manager of the future will want now nothing more than puppets. Mr. Jefferson can be centupled, and may be heard in Bangor or Sacramento on the same nights. Maybe, in time, the photoscope will become so common that actual plays will be considered as things of the past, and only pantomime be the leading business.

Philosophizing, however, somewhat more sagely over the wonderful discovery of the photoscope, an instrument which actually records sounds, and can reproduce them over and over again, one is amazed to think how the possibility of the creation of such an instrument has been, before this, at least, imagined. Just as Swift wrote about the moons of Mars, two centuries almost before their discovery, so has an American story-teller, Mr. Perkins, in a weird tale called the Manufactory, curiously detailed the possibility of just such a machine as is now due to the marvelous inventive talent of Mr. Edison.

Returning, however, once more to where we started from. If the photoscope does nothing else than to repress impossible hunting stories, and if such are no longer to be credited unless supplied with vocal and audible proofs, this new instrument, the photoscope, will have effected a noble purpose.

**THE WOODRUFF SCIENTIFIC EXPEDITION AROUND THE WORLD.**—The purpose of the expedition is to visit points of general and special interest on a carefully considered route

around the globe, to study the arts, ethnology, archaeology, and present condition of the better known countries, and the geography, geology, fauna and flora, as well as the history and character of the people of those less known, and to make collections in various departments of science, paying special attention to the collection of such specimens of natural history as will add materially to the present collections in the National Museum, under the direction of the Smithsonian Institution. An invitation has already been accepted by the director of the Smithsonian Institution, and by the Commissioner of Agriculture to send, free of charge, a representative from their respective departments, for the purpose of making such special collections. It is also intended that those who wish to study navigation and the various collateral branches such as astronomy, meteorology, and the higher mathematics may have a practical opportunity offered by this project; and it is suggested that the studies of manufacturing, mining, and commercial interests attainable throughout the various parts of the world to be visited cannot fail to be of great importance, not only to the student, but consequently to the country at large. The expedition will be absent two years. In order that these promised arrangements should be fully carried out, and the departure be fixed—the date of May, 1878—it is necessary that a substantial vessel should be found, and Congress is to be asked to authorize the Secretary of the Treasury to grant for the purpose of the expedition an American register to a foreign built steamship. This experimental floating college, combining pleasure with solid practical instruction, in fact object teaching on a grand scale, is fully indorsed by such distinguished names as E. P. Whipple, Oliver P. Hubbard, Charles P. Daly, E. J. Nolan, all the Professors of the University of Pennsylvania, Joseph Henry, Secretary Smithsonian Institution; the President of the Cornell University, Professor Gray, of Harvard; the Secretary of State and Governor of Indiana, the President of the University of Michigan, the President of the Rochester University, and all the Professors, with the President, of Yale College. The Secretary of the Woodruff Scientific Expedition is Daniel Macauley, Esq., who may be addressed at the St. Nicholas Hotel, New York, as to the business of the expedition.

**COLUMBIA'S CREW TO GO ABROAD.**—Columbia having failed in her effort to secure a match with Harvard, has, with indomitable pluck, determined to enter the lists with far more formidable rivals, and proposes nothing less than entering the English races for amateur fours, open to the world, at Henly-on-Thames next June. There the New York oarsmen will meet crack crews from Oxford, Cambridge and Dublin, the London Rowing Club, and others. These rivals will demand good work from their foreign competitors, and Columbia's good record in the past justifies the belief that she will acquire herself with honor. Certain it is that the race will be watched with far more interest in America than would be excited by any inter-collegiate matches; and Columbia's crew will carry abroad with them the good wishes not only of her own college but of all who are interested in American rowing.

**MORE ORANGES.**—We are indeed in luck. Santa Claus has not forgotten us this year, that is certain! We have now received a box of splendid oranges from the grove of an old correspondent, George F. Willis, at Bayport, Florida, who has just now fully 50,000 in his packing house. He gives the pleasing intelligence that he was never so busy as at present, from which, and other evidences, we infer that orange culture in Florida is looking up. For ourselves, we believe that it will soon become one of the leading industrial interests of the State.

Mr. Willis adds the following interesting bit of information:

"We had a pleasant call (Dec. 21) from two gentlemen, Mr. Oscar Jasigi and Frederick L'Estrang Hart, who came in with their beautiful yacht, the 'Al Fresco.' They took dinner tea and breakfast, and enjoyed our oranges. We went up the Wekavachia on a hunt and fish with them, and had a jovial time. They sent kind regards, and wished to be remembered to you, and, after selecting a few boxes of our choicest oranges, bade us good bye as they started down the coast in their beautiful craft."

Mr. Jasigi is the Ottoman Consul General at Boston.

**VANITY FAIR.**—Not only we, but all our staff, are indebted to the Messrs. W. S. Kimball & Co. for numerous packages of their Vanity Fair. The office is redolent with the perfume of this fine tobacco. If we are somewhat of an authority in rifle matters, so is Sir Henry Halford, who, like us, is equally learned both in rifles and smoking. Sir Henry says: "Vanity Fair is the best tobacco I ever smoked," and so do we. Sir Henry smoked Vanity Fair in going West. We have used it in going North, South, East and West, and no matter as to latitude or longitude we always found it admirable. There is no use of our puffing Vanity Fair; thousands of smokers do that graceful thing every day.

**THE "KANSAS FARMER."**—This well-known journal, the leading agricultural paper of the West, we always deem among our leading exchanges. Established some fifteen years ago, the Kansas Farmer has, by its enterprise and good judgment, secured a large class of intelligent readers. As a medium of advertisement for seedsmen, live stock breeders, agricultural implement makers, for commission dealers and real estate agents—in fact for all business, we consider this paper as among the best. The American Young Folks is issued by the same publishers, and occupies a prominent position.

# RIFLE PRACTICE OF THE NATIONAL GUARD, 1877.

WE beg to acknowledge the receipt of the report issued by Col. Geo. W. Wingate, general inspector of rifle practice, and Brigadier-General John B. Woodward, inspector general of the State of New York. From this interesting document we make the following abstracts:

**"Rifle Ranges.**—During the past year nine new ranges have been completed, viz.: at Albany, Watertown, Utica, Elmira, Ellipticville, Westfield, Warsaw, Batavia and Lockport. This does not include several ranges established by separate companies. One range, that at Ithaca, has been closed for want of use. The official ranges now used by the National Guard are twenty in number, and are situated at Creedmoor, Albany, Watertown, Mount Vernon (Westchester County), Yonkers, Poughkeepsie, Syracuse, Utica, Oswego, Auburn, Binghamton, Oneonta, Rochester, Elmira, Buffalo, Ellipticville, Westfield, Warsaw, Batavia and Lockport. This is exclusive of several ranges established by various separate companies as to which I have received no report. During the year most of these were personally inspected by me and found to be in good condition. During the past season the range at Creedmoor has been used by over 8,000 troops practicing under orders, and if the addition be made of individual practice, the total number would be 12,000."

Col. Wingate gives the following excellent advice in regard to the construction of ranges:

"Heretofore the tendency in constructing rifle ranges has been to make them too large and too costly. This has been checked as far as possible and always should be. From 500 to 600 yards is the longest distance required for military shooting, and it is to military shooting that a range must look for support. The number who desire to shoot at greater distances is always small, and it is difficult and expensive to procure a range which will accommodate them. Neither is it necessary that a range should be exactly level, as inequalities of the ground may be overcome at a slight expense by the erection of raised firing points. Where a range has cost too much it suffers in the end. Its resources are consumed in keeping down its debt and its operations are constantly crippled. In establishing a range it never should be forgotten that if it is not convenient and easy of access it never will become popular or successful. This is too apt to be overlooked from an erroneous idea of the necessity of having a 1,000-yard range. Neither is it necessary that a range should be purchased or be devoted exclusively to rifle practice. Generally the right to shoot over it upon as many days as are necessary can be secured at a moderate rent. Where the companies of a regiment are detached it is better to have several company ranges, though of the cheapest and most primitive description, than one first-class regimental range. The former plan will result in improving all the companies, while the latter will only help those located near it. As a general thing the saving in the transportation of detached companies will, in a single year, go far toward fitting up separate ranges for them. I think this should be borne in mind in making appropriations for ranges during the next year."

**"Improvement in Marksmanship.**—The great improvement in skill that has been shown in the practice of the troops in the past two years still continues, although the general ignorance in regard to the use of the rifle, which was universal a few years ago, is so rapidly diminishing that the time will soon arrive when the percentages of annual improvement which have hitherto been shown can no longer be attained. This period, however, has not yet been reached. Not only has the number of those qualifying in the lower classes increased during the past year, but the skill displayed by those shooting is of a much higher grade. This is especially shown by the great increase in the number of marksmen. The aggregate number of men of whose practice reports have been received, was 13,343, as against 10,946 in 1876, and 7,670 in 1875. Of these 8,024, or about 68 per cent. qualified in the third class (at 100 and 150 yards), as against 5,341 in 1876 and 2,235 in 1875. Of these 4,330, or about 61 per cent. qualified in the second class (at 300 and 400 yards), as against 2,909 in 1876 and 803 in 1875, a gain of 68 per cent. The total number reported as qualifying as marksmen was 2,126, as against 918 in 1876 and 533 in 1875, being 16 per cent. of those shooting, and a gain of 131 per cent."

In regard to actual practice on the range, Col. Wingate reports:

"In order to make rifle shooting attractive, it is necessary that when men are taken to the range they should be kept shooting. If they spend an entire day, and are allowed to fire only ten shots (as was frequently the case in previous years), they feel as if they had wasted their time. Moreover, the great object to be kept in view is, not the training of a few skilled marksmen, but the instruction of the entire rank and file so as to enable all to have a fair degree of skill with their rifles, and those men who fail to qualify on the first trial are precisely the ones in regard to whose instruction the most attention should be paid. During the practice season volley firing was practiced in the First, Second and several of the other brigades shooting at Creedmoor. The result was beneficial, but the practice was obliged to be discontinued from the injury to the targets and glass caused by the shock of so many bullets and the resulting "splash." This can be obviated by the use of temporary wooden targets placed between the present ones, which might be covered with paper, so that each squad might have a target, which could be removed when its practice is completed, so as to save time in counting the shots."

"Volley firing and also file firing are valuable as giving the men that "fire discipline" upon which so much stress is laid in the German army, and which accustoms them to the conditions of actual warfare. It is, however, a portion of instruction which should not be taken up except by those who have acquired sufficient skill in individual practice as to qualify as first-class shots."

"I think the number of these have now become so great as to make it proper that some practice of this description should hereafter be permitted. A prize for volley or file firing by company teams would be useful, and I hope to see such a match introduced by the National Rifle Association and the other rifle associations of the State."

In revising the Inter-State match, and comparing the scores made with similar matches abroad, the report of the Inspector-General presents the following interesting facts:

If the scores made in this match are compared with those made in a recent contest between the English Volunteers and Regulars, it will be seen that the Volunteers (Queen's Westminster), using the Snider, averaged 33.4 at 200 yards, and 36.80 at 500 yards, total average 74.20; the Regulars (Scotch

Grays), using the Henry-Martini, averaged at both distances 72.10. In the Inter-State match the averages of California were 41.58 at 200 and 41.33 at 500—total, 82.91, and of New York 40 at 200 and 40.58 at 500—total, 80.58. The comparison at 200 yards may not be valuable, as the English shot lying down and at a smaller target, but at the longer distance the conditions were the same.

The inspector pays the following merited complement to the victors:

"The pluck and interest manifested by the California team in coming such a distance to participate in this match, and the skill they have displayed is worthy of the warmest commendation, and no regret should be felt at their success. On the contrary, their victory has done much to increase the public interest in this competition, and to make it a national instead of a local contest."

As to accidents, Colonel Wingate is happy to state that he knows of no serious accident. The changes in the form of the butts introduced last year having prevented the injuries to the markers from the "splash" of the bullets, which formerly were apt to follow from firing on a wrong target, and which threatened to become a serious drawback to the use of iron targets.

The report is very thorough of its kind, and embraces the practice of all the various regiments with percentage of improvement, and many details, from which we find that the Seventy-first Regiment is the first in order of merit, their figure of merit being represented by 85.62. In a future issue we propose entering into further details in regard to this report.

## A CURIOUS RIFLE BALL.

EDITOR FOREST AND STREAM:

MONTREAL, NOV. 27, 1877.

For the past twelve years I have annually hunted the red deer in the same locality—on one of the southern tributaries of the Ottawa River. The "Bush" is about twelve miles in diameter, and is surrounded by settlements, which go far to preclude the chance of deer from other parts wandering into these. I do not exaggerate when I say I am familiar with the makes of all the guns that have been used by others in that district during that period. Last month I shot the largest stag I have ever seen. All hands said it must weigh undressed at least 400 pounds; it had eleven points on one horn and ten on the other. When the skin was removed, I noticed on that portion that covered the neck a lump, the cause of which I at once proceeded to investigate with my knife, when I extricated from a compact mass of gristly matter on the skin, a bullet, the like of which I have never seen before; neither have any of the old settlers in that neighborhood seen an arm discharging such a missile. This bullet I have sent for your inspection by a friend residing in New York, who leaves this city to-day. I refer this matter to your wide experience, that you may express your views as to the arm which discharged the shot. Your conclusions may also tend in some measure to throw further light on the question of the duration of life of the red deer, inasmuch as many years must have elapsed since this strangely formed bullet bored its way through the deer's hide.

Yours truly,

R. H. KILBY.

[We have carefully studied over the bullet sent by our correspondent, of which we give a fac-simile. The diameter of this nondescript ball is 74-100; length, 15-16, and length of bearing in rifling 17-32d of an inch; weight, 1½ oz. The ball has twelve grooves and bands. We think it is a ball belonging to a system of arms in use fully fifty years ago. The bullet was expanded laterally by mechanical force, applied with the ram-rod. This seems quite evident, as the folds of the paper cartridge are indented on the base of the ball. We think the arm which fired this bullet was of French or German make. We should be glad if any of our readers would further enlighten us in regard to this ball.]

## GEN. PORTER ON AMERICAN ARMS.

A public dinner in this city, without a response from Gen. Horace Porter to one or another of the toasts, would undoubtedly leave a fit of indigestion upon the diners. He, quiet and sedate himself, raises such rolls and peals of laughter, so side-splitting efforts in cackling, as to positively endanger the lives of many of his hearers. The "Army and Navy" is the general peg on which Gen. Porter hangs his witticisms, but as he has given up the profession of arms for the more peaceful calling of managing the Pullman Palace Car Company, hence it was necessary to change somewhat the usual toast; but Yankee ingenuity was equal to the task at the dinner of the New England Society, at Delmonico's, on the evening of the 22d, and it was our pleasure to hear another of his sparkling talks in response to the toast:

"Internal improvements—The triumph of American invention, the modern palace runs on wheels. 'When thy car is laden with (dead) heads, good 'Porter' turn the key.'"

Secretary of State, Evarts, speaking of the readiness of the people to sustain their rights by arms, said that "Bayonets are not an institution to be sat upon." Gen. Porter supplemented this by continuing:

"The Secretary of War has told you that bayonets are not an institution to be sat down upon; they are equally bad to be tossed upon. If these things go on, and bayonets are to be encouraged by the secretary to such irregular proceedings, and hold up such terrors to the army, a man won't know where to wear his breast-plate. [Laughter.] A little time ago, when some of us youngsters in the war thought we were doing well enough to shoot people with the single-loading rifle, along comes the inventive Yankee, and then we had Gatling guns and repeaters and magazine guns, and pretty soon we shall have weapons we can load upon Sunday to last us through the week. But not only in the guns, but in the

style of using them as well, we have turned things about! Now, when a man is about to shoot, he flops down on his back, twists himself about a rifle barrel, rests the end of it on his big toe, looks through a complete set of astronomical instruments, and hits every time. [Laughter.] It used to be the man who was shot, but now it is the man who shoots that drops on his back and cocks up his toes. Not content to do our own experimenting in arms, we have inveigled other nations to war by our tempting little pieces. Russia and Turkey got our arms, and went to war to try them, and little Greece got a schooner load, and is itching to take a hand in somewhere to see how they work."

A REPLY TO SIR HENRY HALFORD.—The *Volunteer Service Gazette*, of the 15th of December, publishes an interesting letter of Mr. Geo. S. Schermerhorn, Jr., secretary of the N. R. A., in regard to the practice of the Americans as a team. From Mr. Schermerhorn's letter we take the following extracts, in reply to Sir Henry Halford, who writes:

"The team we had to contend against had been at work as a team since April last, with its staff of coaches and spotters, in whom its men learned to place the utmost reliance, upon the very ranges on which the match was shot. On the other hand, our men were only able to have three days' practice together as a team."

The secretary of the N. R. A. makes the following statement:

"I think Sir Henry is very much in error in this statement, as I shall attempt to show: It was not until June 9, 1877, that the Board of Directors of the National Rifle Association adopted a programme for the selection of the American team of 1877, and appointed therein a series of four competitions of two days each, viz., July 17 and 18, 24 and 25, 31, and August 1, 7 and 8. On the 14th of August the American team was selected in accordance with the terms of this programme."

"The first practice as a team was upon August 21 and 22; the second practice was held August 28 and 29, and on these last two days the range was also occupied by our welcome guests, the British riflemen. On September 1 the British practiced, but the Americans did not; on September 4 and 5 both parties practiced; on September 8 the British again practiced, but the Americans did not. To recapitulate, the Americans practiced as a team only two days before the arrival of the British team and four days afterward—a very different thing you will admit from 'practice as a team from April last.'"

"It is true that Sir Henry Halford, exercising his judgment, practiced nine men even on the very last day for practice; but it is also true that the British riflemen practiced six days upon the range before the week of the match. No one will be likely to claim that during the competitions for places on the American team, when each man was striving to secure for himself, and without the privilege of coach or spotter, one of these coveted places, that this was team practice."

In our issue of December 6 we published similar information in regard to the actual practice of our American riflemen as a team, and are only too glad that the secretary of the N. R. A. substantiates the facts then advanced by us.

MAGAZINE GUNS.—The Secretary of War, it is reported, will invite inventors and manufacturers of magazine guns to submit their models before a board of officers, which is to meet some time early in April; calibre must be .45. We have always affirmed that the magazine gun is the gun of the future.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age.
2. Food and medicine given.
3. Appearance of the eye; of the coat; of the tongue and lips.
4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc.
5. Breathing, the number of respirations per minute, and whether labored or not.
6. Condition of the bowels and secretions of the kidneys, color, etc.
7. Appetite; regular, variable, etc.
8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg.
9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed signs of suffering, etc.

## RABIES CANINA.

920 FOURTEENTH ST., N. W., Washington, D. C.

EDITOR FOREST AND STREAM:

I have just returned from seeing a case of hydrophobia, the history of which may possibly prove of interest to yourself and readers, and I am the more anxious to send you this account, as it shows (at least clearly to me) that the nitrate of silver (lunar caustic) is not the agent we should employ to cauterize wounds made by a rabid dog. In October last, the 20th, I think, a young lad, seventeen years of age, living near Jenalltown, while standing in front of his father's house, saw a sound-dog coming down the road, and as the animal appeared to be astray, and as he wanted a dog for rabbit hunting, he approached it, and finally took it in his arms, intending to carry it to the stable. He patted and fondled it, the dog meeting his advances kindly; but when he playfully pulled its ears it turned and bit him slightly on the left hand near the base of the little finger. Going into the house he recounted the circumstance to his mother, who at once took him to a physician, who, in view of the fact that the animal had evinced no symptoms of madness, did not deem it necessary to cauterize or excise the wound. Two or three days afterward the wound commenced to tingle, burn and throb, and he was again conveyed to a physician, who applied lunar caustic. The wound healed kindly, and nothing more was thought of the matter, but on Dec. 15 he complained of a feeling of soreness in the throat, with a sense of constriction in the precordial region; shortly after he had a slight chill. Upon attempting to drink water he found it impossible, and was nearly suffocated at each attempt. The family physician was at once sent for, and recognized his dangerous malady. He grew rapidly worse, and had paroxysms of partial delirium, with occasional fits of apnoea, during which his breathing would cease for a considerable period. A consultation was called of a number of the most eminent men of the profession, and everything was

tried to alleviate his sufferings, with the exception of Woorara, the South American arrow poison. Finally, caloric hydrate was settled upon as the remedy likely to be of most benefit, and thirty grains of it were given per annuum every hour. This drug certainly cut short the spasms and lessened the sufferings, but at a few minutes of five, this morning, he quietly breathed his last. During his illness the radial pulse oscillated between 130 and 180 beats per minute, his temperature being about 104 deg. Fahrenheit. In the *Medical Record*, of Dec. 15, 1877, will be found a report of a case of hydrophobia by Dr. Warner, and the readers of this article will do well to peruse it, as it is an almost counterpart of the case I have just related. It is particularly noticeable from the fact that many of the symptoms popularly believed to exist in cases of hydrophobia were entirely wanting. There was no violence, no desire to bite, nor were the convulsions very strongly marked. Now, what should have been the proper treatment of this case from the first—that is, the prophylaxis or prevention of the terrible disease from which the poor fellow lost his life? In view of my experience, which has been related in the columns of this journal, I feel warranted in saying that free excision of the wounded parts, if possible, followed by the application of fuming nitric acid, with an after dressing of the fermented poultice, sprinkled with a solution of permanganate of potassa, would have afforded an almost absolute certainty that the septic germs had been destroyed. The nitrate of silver does not go deep enough; it forms a scab, an albuminate of silver, and underneath it the terrible poison is incubating, and shortly is absorbed into the system and spreads like wild-fire, producing, almost inevitably, death. I am forcible in my denunciation of lunar caustic, for this case is, I regret to say, the third in which, within my own knowledge, a misplaced confidence in the remedy has been followed by fatal consequences, and I expect to see more. In my own case, were I bitten by any dog, rather than run a terrible risk I would at once follow the plan of treatment I have suggested, and you will remember, Mr. Editor, how heroically I did this in my own son's case, no fatal results following. If the bite or bites cannot be excised or cauterized at once, do it as soon as possible, even after a week or even longer.

Very truly yours,

H. C. YARROW.

## TWO FOXES IN THE FIELD.

FOX HUNTING IN NORTH CAROLINA.

### FIRST DAY.

I WILL give you an accurate account of a week's fox-hunting in this vicinity, beginning on the Monday, Nov. 12, and terminating Saturday evening, on the 17th.

Just before sunrise, Monday morning, my horn summoned my pack to arise and prepare for sport. It was in fine trim, and vociferously responded to the summons. Mounting Lord Elgin, I dashed at rapid pace for the hunting grounds, some three miles distant. As soon as they were reached Driver gave mouth. All flew to him and seconded his strike, clustering around a stump, smelling closely, then elevating their heads, loudly proclaimed "just so!" But the stump afforded the strongest scent, and the trail could not be carried forward without close nosing. It soon turned into a road, when the track was plain and the direction right. I followed the road more than a mile before the fox left it. A few persimmon trees in an adjoining field invited him from it. After partaking of his favorite fruit, his direction was resumed and continued through woods and old fields until he entered an enclosed piece of cut down pines to rest and luxuriate in the sun. So securely and so soundly did he rest that the pack surrounded him before he suspected their intention. But he was up and equal to the emergency. Squirrel-like, he mounted the logs and limbs, over the heads of the hounds while they were underneath the brushwood, jumping and flying in every direction, and made off at rapid speed before they got fairly out of this entanglement. He made a straight run West for a mile, when he discovered his safety depended upon better strategy, and he began the double, hoping to throw off the pack by abrupt turns. His efforts were unsuccessful, and in nine minutes he caved in and threw up the sponge. I had scarcely rested after returning home before the shrill sound of a small horn announced the coming of some huntsman friend. It must be Broadnax, of Virginia; but, no! the horn is too soft for him. I went to meet the most welcome comer, and noticed at the outer gate, some 500 yards distant, a single rider and six dogs. In a few minutes the rider was before me. He handed me a note from Genl. P. B. Starke, of Virginia, written in a most affectionate strain tendering me six of the best dogs of his pack. I had ten couple already of staunch and reliable qualities, and this addition made my pack capable of an assortment to suit any and every style of hunting. I had scarcely fed and put them in the kennel before a note is handed me by a special comer with the pleasant information of, "I am down—join me in the morning. Say when and where,"

BROADNAX.

I immediately replied, "Certainly—about sunrise—our objective point must be Mrs. Mason's; keep a converging line to Arrington's."

### SECOND DAY.

At a very early hour on Tuesday morning, Nov. 13, I was up and ready for operations. I soon warmed my bread, made a pot of strong hot coffee, with pure fresh cream and butter, and sat down to a breakfast which only huntsmen know how to appreciate. Before the sun was up I blew my horn, mounted Lord Elgin, and in a trice was off as agreed upon. I had not proceeded far in the line decided upon before a courier came to me from Broadnax with the pleasing information that the old red had been seen that morning after day on Goblins Hill, two miles below Gaston. I pressed forward with quickened pace and soon came to the hunting party quietly waiting my arrival. We had scarcely finished salutations when I was consulted whether the old red or a gray should be hunted. "The old red, of course," I replied. All the party except Broadnax had urged a gray, but my choice prevailed, and off we moved in the direction of Goblins Hill. We had scarcely arrived at its base before the fox's trail was struck. In an instant the fox was up and off. The start was fair in every essential. Not a dog was out of place! The fox ran out of a small thicket in full view of the foremost huntsmen, bounding like a ball and clearing a deep ravine just there, without effort. He was too closely pressed to run before the wind, as was his invariable practice, but rushed

right away regardless of wind or tide, earnestly endeavoring to gain distance. After a straight run of a mile he was forced to make a curve and traverse nearly his track. I halted with several others to note his next dog as soon as the sound of the pack indicated this movement. As quick as thought the fox passed us with thirty steps, and close upon him came thundering the whole pack. The woods fairly trembled with the sound. Twenty-six couples of hounds as noisy as forty pianos, make no ordinary music. The same number of clarionets could not produce such silvery music. We marked the leading dogs; Broadnax had three covering the track and clear in advance of the pack. Where is Gen. Starke's Dolly? there she is, but a little to the left of the trio. Where is my Logan? still further to the left, and still further outside of all, is my Rodman, moving like a frightened cur, and with such speed that a mere glimpse is afforded us. After passing us the fox ran down the Roanoke for a mile or more, and curved back, laying his course up that stream. I again halted to note as before the leading dogs. Several had been thrown out and stopped with me, seeming disinclined to take further part in the chase. I had scarcely posted myself before the fox ran right square up to me, in full view of the dogs with me, but soon out again. The pack came dashing on with Gen. Starke's Dolly first in my sight. I had no time to wait the approach of her or the pack, but pressed for the dogs (only three) that had accidentally disturbed the sport. I soon, however, got a large number up, and no time was lost or distance gained by the fox. His course too was not turned. Up the Roanoke he moved with failing pace to Broadnax's plantation at Gaston. Then he turned north and made for an oak forest on the river hills near Dr. Wilkins'. As the dogs came out of the forest I saw Broadnax's Bill Ney and my Comet fully thirty paces ahead, and the pack only the half of its proper size. How is this? What has occurred? It was evident. I left the other huntsmen, dashed back and soon came upon some eighteen of the best runners in the field in close pursuit of a gray. The very first break was taken advantage of. I broke them off and dashed for Goblins Hill, a noted place for observation. On its summit I met the pack after the red, who had adroitly got a good distance ahead, and had matters just as he wished. But my reinforcement soon changed this condition of things, and we were again at his heels. He must have loitered in the same forest in which the pack was divided, for he came out of it not a hundred steps in advance of the pack. He ran right toward the Gaston low grounds, then turned abruptly back on his tracks, ran into a thicket on the outskirts of the low grounds, and out ran a gray fox, both red and grey in full view of the huntsmen at the same time. Unfortunately my dog pursued the gray, and after a spirited race of ten or fifteen minutes caught him. We were now more than a mile from the place where the change of foxes occurred, and knowing the old red would continue to move as long as a note like a horn could be heard, we counseled and determined to rest Wednesday (Nov. 14) and to make an early move on him Thursday morning (Nov. 15). And in my next you shall have the result, though I am now laboring under the effect of the largest freshest ever witnessed in the Roanoke, sweeping away every thing in its violent course, fodder, oats and pumpkins, and submerging my entire crop of corn. This river has manifested a turbulence this fall not heretofore witnessed by me, and now has grown into a bad sea, reaching from hill to hill and covering every foot of land between. But amidst all this destruction I mounted Lord Elgin this morning and hunted its bills with my usual good spirits.

Gaston, N. C., Nov. 26, 1877.

T. G. T.

BIRMINGHAM DOG SHOW.—This leading English dog show was concluded in the week ending December 8, and there were over 1,000 entries. The following gentlemen were the judges:

POINTERS.—Viscount Combermere and Messrs T L Brewer and E Lewis; Bloodhounds, Mastiffs and St Bernards—Mr E Hanbury; Deerhounds and Greyhounds—Mr S Malabey; Otterhounds, Harriers, Beagles, Dachshunds, Dalmatians, and Foreign Non-sporting Dogs—Mr T Fisher; Fox-terriers—Mr W Cropper and the Rev Cecil Legard; Setters—Rev R O'Callaghan and Mr C G Ross; Retrievers—Mr W Lort and Col J J Allison; Spaniels—Mr C B Hodgson, Major H W Villet and the Rev A L Elliot; Newfoundland and Foreign Sporting Dogs—Mr W Lort and Mr M Smith; Sheep Dogs—Mr W Lort; Bulldogs and Bull-terriers—Mr J Taylor and Mr J Percival; Smooth-haired, Black and Tan and Yorkshires Terriers, Pomeranians, Pugs, Maltese, Italian Greyhounds, Blenheim and King Charles Spaniels and Toy Terriers—Mr M Hedley and Mr P Eden; Skye Terriers, Dandies, Bedlington, Wire-haired and Broken-haired Terriers—Mr J Nisbet and Mr G Parker.

We give the prize-winners in pointers and setters:

POINTERS.—(large size)—Dogs (Champion Class)—Prize, Mr R Price's Wagg; H C, Mr J H Whitehouse's Trent. Bitches (large size, Champion Class)—Prize, O H Mason's Lady Isabel. Dogs (large size)—First, Mr T Sturgeon's Burr; second, Mr G Pilkington's Faust; C, M R Price's Eos Gymrwy. Bitches (large size)—First, Mr G T Bartram's Stella; second, Mr G Moore's Maggie; H C, Mr J E Mason's Nina; C, Mr R Price's Mend and Mr J N Clark's Blair. Dogs, small size, Champion Class—Prize, J H Whitehouse's Cedric. Bitches, small size, Champion Class—Prize, Mr J Fletcher's Luna; H C, Mr J H Whitehouse's Lady Pearl. Dogs, small size—First, Mr R P Leach's Ben; second, Mr G T Bartram's Special; C, Mr J Kennedy's Priam. Bitches, small size—First, Mr J H Whitehouse's Reine; second, Mr R Price's Bow Belle; H C, Mr J Jenson's Flora; C, Mr J H Whitehouse's Regent and Mr J Huggins' Juno.

SETTERS.—English.—Dogs, except black and tan, Champion Class—Prize, Mr J Fletcher's Rook. Bitches—Prize, Mr W Van Wart's Belle. Dogs—First, Mr G de L Macdonald's Ranger III, late Dick; second, Mr R L Purcell-Llewellyn's Count Dick; V H C, Mr R L Purcell-Llewellyn's Prince Royal and Mr F Jones' Roll II. Bitches—First, Mr R L Purcell-Llewellyn's Princess; second, Mr R L Purcell-Llewellyn's Novel; V H C, Mr A H Jubb's Kate. Dogs, black and tan, Champion Class—Prize, Mr W Coath's Lang. Bitches—Prize, Mr E L Parson's Floss. Dogs, black and tan—First, Mr J Richardson's Duke; second, Capt F W Bashin's Monarch; V H C, Mr O H Mason's Ronald and Mr H Maplebeck's Blossom; C, Mr T W Webber's Scamp II. Bitches—First, Mr W M Eglington's Nell; second, Mr T A Negus's Sherry; V H C, Mr R Cathcart's Rapid. Dogs and Bitches, Irish, Champion Class—Prize, Mr T M Hilliard's Palmerston. Dogs, Irish—First, Mr G de L Macdonald's Rover; second, Mr J Kennedy's Dick; H C, Mr F W Faris' Rover and Mr J Fletcher's Grouse. Bitches—First, Mr J H O'Brien's Kate; second, Mr J S Skidmore's Poll.

The show of the kennel club was to take place immediately afterward, at the Alexandra Palace. Nearly 1,200 dogs had been entered, including representatives from the best kennels in England.

ST. LOUIS BENCH SHOW.—The interest in this show is still at fever heat, and all the officers are doing their best to make the event a leading one in Western canine annals. Many special prizes are coming in—in fact already their aggregate value surpasses \$2,000. About next week we trust to be able

to give the fullest details. Special rates have been obtained on all the railroads coming into St. Louis. A change, we are informed, has been made in the \$100 kennel prize by the substitution of the words *or bred*; now it reads dogs "owned or bred." The medals for sportsmen's goods are quite costly and represent, as announced, every dollar of their actual value. As there are no entry fees for sportsmen's goods, to win these prizes would, of course, be an important object. Miss McKellops has presented one of her best pictures, worth, at the lowest, \$150. Some of the judges have been already appointed, among them we may mention Col. Skinner and Dr. R. Young. The association have engaged the rink for the whole of January and February, so as to have the place perfectly under their control long before the bench show commences. Want of space prevents our giving the classifications in this number. We trust to find a place for it in our next.

DETROIT BENCH SHOW.—It will be seen from the following that the proposed show has been postponed:

DETROIT, Dec. 30, 1877.

Editor Forest and Stream and Rod and Gun:

DEAR SIR.—Owing to the committee not being able to engage a satisfactory place to hold the bench show, it is postponed for the present, much to the regret of many owners of dogs. Yours truly,

CHARLES LINCOLN.

MASSACHUSETTS KENNEL CLUB.—Boston, Dec. 31.—*Editor Forest and Stream*.—The Massachusetts Kennel Club, at their last meeting, decided to give their initiatory bench show in the early spring, probably during March. HUTB.

Commenting on the Alexandra Palace Bench Show, the *Live Stock Journal* has the following remarks:

"Turning now to the show we have to review, to commence with, the honest open judging—the public can see it; the press, catalogue in hand, can look on; the press is not even deterred from talking to a judge. The dogs, too, are led around a large open ring, where every flaw or fault in head, or limb, or loin, may be spotted at a glance. The judges, as a rule, are better chosen than at Birmingham. The dogs, too, may be led round by the owners, or their servants, and this is a great advantage. How, for example, can a setter show head or stern if he is dragged and bullied into the ring by a man that makes him tremble? The time the dogs are confined at this great show is but four days, and they are brought in on the morning of the show, thus reducing the actual time of their incarceration to a minimum.

Future associations having bench shows in view, would do well to think about all such matters. In the centre of every bench show room, there should be made some kind of an inclosure, where the dogs can be moved when being judged. Hauling a dog down stairs and up stairs to be judged does not improve him.

DOG AND POULTRY SHOW AT PITTSBURGH.—The Western Pennsylvania Poultry Society will hold its sixth annual exhibition at the City Hall Pittsburgh, commencing on January 17th, and concluding on the 25th. Address E. Gregg, President, or C. B. Elben, Secretary. The show is open to dogs, under the rules of the Kennel Club, and it is believed that a fine show of dogs and poultry will be on exhibition.

MEADVILLE PA. ASSOCIATION.—The Meadville Dog, Poultry, Pigeon, and Pet Stock Association, will hold their first show on the 25th, 26th, 27th and 29th Jan., 1878, at Meadville, Pa. Premium lists will be furnished on application to the corresponding secretary. The following are the officers: President, A. McLaren; Vice-President, Dr. S. A. Gawer; Corresponding Secretary, W. A. Logan; Recording Secretary, Wm. Craston; Treasurer, J. Worst; Executive Committee, J. W. Babcock, Edgar Hindekoper, Geo. M. Orris, O. H. Blystone, Chas. Colt, M. Minium, and C. McLean.

MASSACHUSETTS KENNEL CLUB.—This association, which undoubtedly will occupy a leading position in canine matters in New England, held its first meeting on Dec. 5, 1877, when the following gentlemen were elected: W. H. Cowing, president; J. Fottler, Jr., first vice-president; E. L. Dorr, second vice-president; T. T. Sawyer, Jr., treasurer; E. J. Forster, secretary, who also constitute ex-officio the executive committee. The charter (under the General Law of Massachusetts) was obtained from the Secretary of State, Dec. 13, 1877.

The object of the club is stated in the constitution, namely, "To encourage interest in dogs, promote improvement in their breeding and management by means of exhibitions, the distribution of awards, the gathering and disseminating of reliable and practical information relating thereto; or by such other means as the club may vote."

The association is composed so far of gentlemen of Boston. In addition to the officers already mentioned, the following gentlemen are members of the Massachusetts Kennel Club: Dr. J. Nelson Board, Dr. F. B. Greenough, Mr. Lee J. Colley, Samuel W. Rodman, Frank L. Barnes, James R. Curtis, Samuel Hammond, W. P. Fay, Luther Adams, Edward P. Brown, Edward E. Hardy, and Charles E. Fuller, all of whom are of Boston. The membership is limited to twenty-five.

RABIES CANINA.—We would direct particular attention to a communication addressed to us by Dr. H. C. Yarrow, U. S. A. Dr. Yarrow's advice in regard to the method of treatment in hydrophobia comes quite opportunely as an adjunct to Sir Thomas Watson's admirable paper on hydrophobia and rabies, published in the *Nineteenth Century*. We propose in the next issue of the *FOREST AND STREAM* and *ROD AND GUN* to give a careful abstract of Sir Thomas Watson's excellent article. We have implicit faith in Dr. Yarrow's medical judgment, and believe that by his method of treatment for hydrophobia lives can be saved.

## Yachting and Boating.

THE ROWING SEASON OF 1878.—The rowing season opens with a series of challenges to championship match, which, with others likely to succeed them, will make the year 1878 memorable in aquatic annals. Courtney having accepted the challenge of Trickett, the Australian oarsman, will meet that formidable rival on American waters in a match for the championship. In the meanwhile a number of contests will in all probability come off, the result of which may materially affect this world-championship match. Boyd and Higgins meet shortly on the Tyne for their third and final contest for the English championship. The winner proposes to meet Trickett for the world's championship, and should he come out the better man, it would provide a new opponent for our American sculler. We agree with the *Herald* that this match should come off on American waters instead of the Englishman going to Australia, expending time and money in the long journey there. Then there are other complications on this side of the Atlantic. Courtney pulled as an amateur at the Centennial, and consequently did not then meet Hanlon, of Toronto, who won the American professional championship. A match between these two should be rowed before the match with Trickett, or, in case he is defeated, by Boyd or Higgins as the case may be. Then there are to be meetings of Hanlon with Scharrf and Morris, and the result of these must, of course, be calculated as affecting the final match. Of one thing at least may we be confident: the man who proves himself the best oarsman will have a hard-won victory, and will richly deserve all the honors attaching to that distinction.

COURTNEY CHALLENGES AMERICA.—Courtney has sent out a challenge to any oarsman in the United States or Canada for any amount of money and the championship of America, the race to be rowed prior to the Trickett match in July next.

COURTNEY AND TRICKETT.—These two oarsmen are likely to row together. Courtney has accepted the latter's challenge to row a three-mile race, straightaway, for \$1,000 a side, £250 forfeit, on any neutral water in the United States, and has named Oswego Lake for the meeting.

COLUMBIA IN ENGLAND.—Columbia's crew now proposes a European tour. They go first to England to engage in the Henly races on the Thames, and from there to Paris. The six men from whom the final four are to be chosen are Messrs. Goodwin, Boyd, Sage, Colgate, Timponson, and Ridabock. Captain Goodwin and Mr. Timponson, it will be remembered, have a record running back to the University race of 1874. Messrs. Boyd and Sage were in the '75 crew; and the others have pulled in the past season. The crew have been very successful in this last summer, beating picked fours of the Atlanta and Argonauta clubs. From England the crew go to Paris to participate in the Exposition races.

—Hon. Oscar Jasigi, the Ottoman Consul General at Boston, was reported off the Wekawacha River, west coast of Florida, Gulf of Mexico, on Dec. 21st, in his beautiful yacht "Al Fresco." He is on a pleasure tour, and is accompanied by Mr. Fred L'Estrang Hart.

BOAT FOR FLORIDA WATERS.—We intended to inform our correspondent M., in a recent issue by a foot-note to his letter in our Yachting column, that Dr. Kenworthy ("Al Fresco") has more than once taken great pains to give the specifications and working plans of a boat which long experience has taught him is the best adapted for use in Florida waters. An article which enters into the subject in detail will be found in a former issue.

ST. LOUIS, Dec. 27, 1877.

EDITOR FOREST AND STREAM:

I am deeply interested in the articles on boat building by "Nauticus," and have been able to follow him easily with but one exception—that is: how does he obtain the water-lines in the half-breadth plan? (See diagram on page 256, issue Nov. 1st.) He says, "Mark on each cross-timber the points where the water-lines cross them." How does he get the proper distances at which to mark these points? An early answer will oblige.

W. B. S.

## Rational Pastimes.

NEW YORK ATHLETIC CLUB.—The athletic tournament which is to be held under the auspices of this club at Gilmore's Garden tomorrow evening and Friday evening, comprises sixteen contests, for each of which the list of entries is remarkably full. The programme for each evening has been so arranged as to afford a varied and attractive entertainment. There are in all one hundred and eighty-two entries, representing all the prominent athletic clubs of the vicinity. The numbers of contestants in each match are: Half mile run, 15; one mile run, 13; seventy-five yards hurdle, 4; sparring, light weight, 5; middle weight, 5; heavy weight, 5; fencing, 5; seventy-five yards, special, 4; one mile walk, special, 5; one lap hurdle, 11; seventy-five yards, handicap, 38; amateur tug of war, 5 teams of 10 men; professional tug of war, 4 teams of 5 men; four hundred yards, handicap 21; mile walk for those who have never beaten 8:30, 27; two-mile walk, handicap, 16.

POLICE ATHLETIC TOURNAMENT AT GILMORE'S.—The programme of the coming Policemen's Athletic Meeting at Gilmore's has already been referred to by us as unusually large and attractive. The prizes of the various contests are to be competed for by a number of keen contestants. Of course, some fine display of muscle may be expected; for what is a policeman if not athletic, and when one goes to witness the best physical development of men who are, from their calling, supposed to be unusually muscular, he is warranted in expecting some extraordinary feats. We are tempted just here to urge that the tournament be attended by all the vast multitude of gentlemen who earn their subsistence by the sweat of their brow, it is true, but still in a vocation not always recognized as legitimate by society and which frequently brings them into personal intercourse with the police. We are confident that it would be of fascinating interest for them to witness the displays of running, wrestling, boxing and other accomplishments. But then we refrain from our proposed suggestions, for these gentry never read *FOREST AND STREAM*. We, however, trust that there may be a full attendance of all lovers of genuine athletic sport next Monday evening.

QUEEN'S COUNTY HUNT.—There was a special meet of the Hunt at Garden City New Years Day. The ground was hard and frosty and properly there should have been no hunt, but twenty ladies and gentlemen were on hand with poor Reynard, who had been brought in a bag on the train with the hunters. There was a long drag chase before the fox was turned out. When those in charge of the drag had reached East Meadow Brook, and the field had become pretty well thinned out, Reynard was set free in a field where he lay down and sullenly waited for the hounds to come up. The chase was ingloriously terminated when the leading huntsman came up to where the men in charge were warding off the hounds, and despatched the cowering creature by knocking him on the head.

## New Publications.

LOVE AND DUTY. By Mrs. Hubback. Philadelphia: T. B. Peterson & Bros. Price \$1.

This is the twelfth volume of the "Dollar Series." Love and Duty are interwoven through the pages in a natural and effective style keeping up the interest of the reader to the end.

THE AMERICAN CRICKETER.—This little paper is devoted to the game of cricket and the interests of cricket players. It is filled with a variety of matter, and appears each month. In the cricket season it becomes a weekly.

HOW THE ANACONDA EVADES THE LAW.—Probably few passengers on one of the Jersey City ferry boats the other day were aware that that quiet man had an anaconda in his carpet-bag. But that's exactly what was there. The great Aquarium constrictor refuses to eat any food which she has not killed herself. But Mr. Bergh decrees that she shall not be fed on live animals. So when the time comes for her meal her keeper puts her in his bag, takes her over to Jersey, gives her a square meal of live rabbits and doves, and brings her back to her Aquarium case.

THE GELADA.—Several living specimens of this extremely rare Abyssinian monkey, first described by Dr. Ruppell in 1835, have quite recently reached this country for the first time, and are being exhibited at the Alexandra Park. The exact affinities of the species have never been fully determined, different biologists placing it, some with the Macaques, others with the baboons. It is peculiar in that the male is covered with very lengthy hair, like that of the waderoo, whilst the female is a much more ordinary looking

monkey. In the male also there is a bare spot, in shape like an inverted T, upon the breast, which is of a bright pink color, becoming red and expanded into an inverted heart-shaped patch upon excitement. The tail is long and like that of a lion, having a bushy tuft at the extremity. The color is a sooty, dark-gray brown, verging upon black; the hands and feet are black; the nails are powerful and long. The size of the male is about that of a chimpanzee four years old; the eyes are close together and the snout prolonged. The living animal has a habit of evertng the whole upper lip when irritated, and thus exposing its formidable array of teeth.—*Nature*.

A FAITHFUL DOG'S REWARD.—The Jefferson (Mo.) *Tribune* says: "A gentleman who lives in Vernon county tells a remarkable story of the sagacity of a dog which accompanied him on his travels. While in the Short Creek timber, on his way to Joplin, the dog jumped and caught the horse by the bridle rein. Mr. Ewing drove the animal off, but it persisted in catching the horse by the reins, until the gentleman concluded it must be mad. Under the impulse of the moment he pulled his revolver and shot the animal, which then ran back along the road over which he had come. In a few minutes Mr. Ewing missed his overcoat, which had been tied to the saddle. He turned back to find it, and after riding about a mile, not only found his coat, but his faithful dog, which was lying on the garment dead."

AN ORIGINAL SUICIDER.—The suicidal mania assumes strange forms. Here is one of the latest methods:

In Placerville last Sunday a young German named Charley Roth committed a dreadful suicide. Procuring a giant powder cartridge and two feet of fuse, he retired to his sleeping apartment. In a minute or two a loud and sharp explosion was distinctly heard several blocks away, and when people from the street hurried into the room they found him lying on the pallet entirely headless, an immense cavern hollowed out of the upper part of his chest, and his teeth and fragments of his skull scattered in every direction. From the middle of the neck upward all was blown to atoms, not a vestige of his head or face remaining. The presumption is that he lay down upon his pallet, took the end of his cartridge into his mouth, connected the fuse with the cap, lit it, and deliberately awaited the explosion.—*Nevada Territorial Enterprise*.

—It has recently been discovered in France that wine may be injured through the glass of the bottles in which it is contained being too alkaline. According to analyses given by the *Revue Industrielle*, glass for wine bottles should yield per 100 parts: silex, 58.4; potash or soda, 11.7; lime, 18.6; clay and oxide of iron, 11; other ingredients, 0.8. Glass in bad bottles has been found to contain: silex, 52.4; potash or soda, 4.4; lime, 32.1; clay and iron, 11.1. The wine suffers principally from excess of lime. Thus, in glass composed of silex, 45; soda, 15; lime, 30; and clay, 15; for example, the wine became thick, and lost its aroma. The best bottle glass contains from 18 to 20 parts of lime, and 59 to 60 silex; the worst, 50 to 52 silex, and 25 to 30 lime.

AN ANECDOTE OF DANIEL WEBSTER.—Webster was out one day on the marshes near Marshfield, busily shooting birds. It was a hot afternoon in August. The farmers were getting in their salt hay on the marshes.

He came, in the course of his rambles, to the Green Harbor River, which he wished to cross. He beckoned to one of the men on the opposite bank to take him over in his boat, which lay moored in sight. The man at once left his work, came over, and paddled Mr. Webster across the stream. He declined the payment offered him, but lingered a moment with Yankee curiosity to question the stranger. He surmised who Mr. Webster was, and with some hesitation remarked:

"This is Mr. Webster, I believe."  
"That is my name," replied the sportsman.  
"Well, now," said the farmer, "I am told that you can make from three to five dollars a day pleadin' cases up in Boston."  
Mr. Webster replied that he was sometimes so fortunate as to receive that amount for his services.  
"Well, now," replied the rustic, "it seems to me, I declare, if I could get as much in the city pleadin' law cases, I would not be a-wadin' over these marshes in hot weather shootin' little birds!"

THE S. F. P. C. A.—Since the 1st of January, 1877, the Society for the Prevention of Cruelty to Animals has prosecuted 525 cases of cruelty in New York and Brooklyn. Of these, 487 resulted in the conviction and punishment of the offenders. Special agents, or street patrol, turned out of harness 1,961 horses that were lame and sick. The agents humanely destroyed 1,202 horses, and 400 small animals.

—How to make a catfish—Leave her alone in a room with an aquarium.

MESSRS. TIFFANY & CO., UNION SQUARE, NEW YORK City, have made extensive preparations for the approaching HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair. Make only the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Yet. Coat, \$35.00. For full Suit, \$14.00. I also make the Sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

## THE HAZARD POWDER CO., MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed to point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

Nos. 1 (fine) to 6 (coarse). In kegs of 25, 50, and 6½ lbs. and cans of 5 lbs. and 1½ lbs. Also in 1 and 2 lb. canisters. Burns strong and clean. The KFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FFG is the standard rifle powder of the country.

## Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office,

JAMES BRADY, Manager and Proprietor.

## Sportsmen's Goods.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

W. SIMMONS &amp; SON,

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest, and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

## OUR PATENT DECOYS

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen: geese, \$3 each; yellow leg, \$4.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; golden plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.50 per dozen. We are now making standing geese for field shooting.

## THE HUNTER'S TENT

is made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

In the judges' report at Philadelphia they were commended for excellence in every part. Very novel and practicable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quickly folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

SIR:—I have just returned from a "three-weeks" camping expedition in the Adirondacks, and have had the three tents bought of you put to the severest tests of exposure both as to wind and storm, and I do most unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.

2d. They are perfectly waterproof.

3d. They are a good height, and all the room is available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both endorse what I say about your tent. With kind regards, yours truly, F. B. SAVAGE.

## Tan-Colored Leather Pliable Waterproof Suits.

Shooting Coats; Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches, \$15; Jackets, \$18; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of skin. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and after drying was happily surprised to find it had not stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with flannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

For every kind of sportsmen's goods address

G. W. SIMMONS & SON,  
Oak Hall, Boston, Mass.

## F. R. S.

## F. BOOSS &amp; BROTHER.

Scroll Saw

**Excelsior**  
LATEST IMPROVEMENT.  
Double Treadle, including one dozen saws, thirty inimitable Free Sawing Patterns and prepared Wood, to the value of \$4. A new device for tightening Saw, Power Drilling attachment, Wrench, Oil Cup and Screw Driver. Speed, 600 strokes per minute. Saws, 12-inch thick. Price, complete, cash and delivered on board cars or at Express office \$10.  
Saw only, without attachments, \$5.

Pony Planer

**BUFFALO PONY PLANER.**  
NEARLY ONE THOUSAND IN USE.  
Buffalo Pony Planer. Will earn its self and pay expense of running in 3 days. Price from \$50 and upwards, cash.  
LIGHT MACHINES FOR PONY OR HORSE POWER.  
The great users of these machines is unprecedented, and it may be confidently affirmed that no article has ever more clearly proved its superiority for the quantity and quality of its work than this. It is made in several sizes, and can be fitted to those above mentioned.

Buffalo Excelsior Pony Planer and Mather.

Patented March 30, 1875.

Best of its kind in use.

Price, complete, \$25.

Also Planing Machine

Knives, which are recommended as superior and extra in quality.

Small Steam Engines

**SMALL STEAM ENGINES.**  
With Copper Boiler, to drive light Lathes, Scroll Saws, etc. Are all sizes from 2-8 up to a horse power; either plain castings, partly finished, or complete, ready for use.  
The "Scientific American" of June 29, 1875, says of the above, in an extended Editorial, introducing our manufactures to the public: "It can turn wingers, churns, washing machines, ice cream freezers, run eddies mills, pump water through a house, accurate foot lathes, run knitting or sewing machines, turn a grindstone or emery wheel, vent fluting or hand thrashing machine cutters, meat or feed choppers, or sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a blacksmith's forge, or compress air or work an air pump on a small scale in a laboratory. These are a few only of the purposes to which it can be applied."  
Also Engines and Boilers capable of propelling the boats have keel, stem, 25 to 18 inches. The boats have keel, stem, with rudder and tiller, row locks and oars; Those wishing a pleasure boat will find

ling boats from 25 to 35 feet long, 4-12 to 5-2 feet beam, with draft of water

and rudder post of oak, pine planking, copper fastened throughout, fitted

skins all around the boat, lockers and coal bunkers, and have two coats of paint.

these the safest and fastest, as they can be made to attain a speed of from 6 to

26 miles per hour.

The boats are adapted to

great variety of uses,

such as Excursion,

Shooting, Fishing or

Pic-Nic Parties, for

travellers, voyagers,

boatmen and tourists,

and especially owing

to their light draft of

water for exploring expeditions and surveying parties. The Engine and Boiler can be easily detached from the boat, and is then

for running light machinery.

Price of 20 foot boat complete,

\$125.00

Price of Engine and Boiler, without boat, including driving pulley,

\$75.00

SEND FOR CIRCULAR.

H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.

## Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside.

Head solid and much thicker than any Shell now made, giving a solid seat, for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rust nor corrosion fast, like movable anvil made from steel or iron. Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2½ to 3½ inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.

MESSES. GEORGE B. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.

Yours truly,

A. H. BOGARDUS.

## A VICTORIOUS INVENTION The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation. It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape.

It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

## PRICE LIST.

No. 1—For fishing and all kinds of small game and animals, sent by mail, 50 cents.  
No. 2—For catching Mink, Muskrats, Rabbits, large Game, Fish, etc., 75 cents.  
No. 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, etc. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight, 10 to 15 lbs., \$10.  
All goods sent, charges paid, to any address on receipt of price. Address

Stent & Co., Mfr's. Agents,  
132 Nassau St.,  
NEW YORK.

**SHONINGER ORGANS.**

**PRONOUNCED UNANIMOUSLY AS THE**  
**Best Instruments.**  
Their comparative excellence is recognized by the  
Judges in their Report, from which the following  
is an extract:  
"The B. SHONINGER ORGAN CO.'S exhibit  
as the best in the world. In rendering them  
possible to a large class of purchasers, having a com-  
bination of Reeds and Bells, producing novel and  
pleasing effects, containing many desirable im-  
provements, will stand in dry or damp climate, less  
liable to get out of order, all the boards being made  
three-ply, put together so it is impossible for them  
to either shrink, swell or split." THE ONLY  
ORGANS AWARDED THIS RANK.  
This Medal and Award was granted after the most  
severe competition of the best makers, before one of  
the most competent juries ever assembled.  
New styles and prices just issued, which are in ac-  
cordance with our rule, the BEST ORGANS for  
the least money.  
We are prepared to appoint a few new Agents.

## W. W. Greener's CHOKE-BORE GUNS,

Tried on Game in America.

Supplied by H. C. Squires, 1 Cortlandt St. NEW YORK.

## See the Following Testimonials

SIR—A pleasure for me to inf. you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in lowering pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performances of this gun. The 28-inch 10-gauge barrels, charged with 4 1/2 drachms of powder and 1 1/2 oz. No. 6 English chilled shot, give patterns ranging from 285 to 330 pellets in 30-inch circle at 40 yards. The same charge of powder and 1 1/2 oz. No. 4 American shot gives 160 to 175 pattern, with penetration which kills ducks at 50 to 75 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 28-gauge 28-inch modified choke-bore barrels, with 3 1/2 drachms of powder and 1 1/2 oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally and ruffed grouse, woodcock and quail, these birds being killed, with few exceptions, at from 15 to 25 yards.

COL. JOHN BOWNE.

DEAR SIR—The guns arrived all right. We think these last guns you have sent us will place the Greener guns ahead of any other in this country, as guns of other makers don't compare in shooting qualities with them. We unhesitatingly recommend the Greener as far superior to any gun of foreign or domestic manufacture that we have seen. We say this after seeing and using guns of all the most celebrated makers. CARLISLE, JONES & CO. SELMA, Ala.

The Greener gun presented by Mr. Squires for the best pointer and awarded to me, is a close, clean, and a hitter, killing its game at very long distances. It is the second Greener that I have owned and they cannot be beaten. A win with them at the trap or in the field. S. B. DILLEY. LAKE CITY, Minn.

SIR—I have a pair of W. W. Greener's breech-loaders (bought of H. C. Squires, of New York), modified choke-bore. I have had an opportunity to test these weapons on birds heavily feathered, and where great penetration was essential to success. I have repeatedly made long shots, always killing the game clean. At a target both guns made a very even distribution of the shot, with extreme penetration.

SIR—The Greener breech-loader I purchased of you is very fine indeed, and gives great satisfaction. WARREN, Pa. ROBERT DENNISTON.

W. W. GREENER, St. Mary's Works, Birmingham England.

## Fishing Tackle.

## H. L. LEONARD,

Manufacturer of every variety of

FINE RODS for SALMON, BASS and TROUT FISHING.

## Split Bamboo Rods a Specialty

Every Rod bearing my name is six strands from butt to extreme tip, and mounted with my "patent waterproof ferrule," and warranted against imperfections in material and workmanship.

Any style of finish, hexagonal or round, as may be desired. Rods of Greenheart, Ash, or Lancewood, MADE TO ORDER.

I was awarded a MEDAL and DIPLOMA at the Centennial for my Split Bamboo Rods.

MANUFACTORY, BANGOR, MAINE.

A variety of my rods may be found at

No. 19 BEAVER ST., New York City (Up Stairs).

## Three-Barrelled Breech-Loading Guns, TWO SHOT AND ONE RIFLE.

A new feature in the Sporting Line. Forms a light and compact gun from eight to ten pounds giving to sportsmen the very thing so often wanted in all kinds of shooting.

PRICES—Three barrel, \$75 to \$250. Double barrel shot guns. Damascus barrel, \$50 to \$200. Twist barrel, \$35.

SEND FOR NEW CIRCULAR.

W. H. BAKER &amp; CO., Syracuse, New York.

## IRA A. PAINE'S CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

They will eventually be the Standard Ball. Out of One Million already sold, not one complaint. No Fancy Price, but a fair profit. Every ball is warranted to give satisfaction. The number of orders from all parts of the country speak volumes.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

## PAINE'S PATENT Feather-Filled Glass Balls and Huber Traps.

MESSRS. WILLIAMS & POWELL HAVE ORDERED 30,000 OF THE FORMER, AND FORTY OF THE LATTER. THEY WILL BE SHIPPED FOR ENGLAND ON SATURDAY NEXT. THIS, WITH THE LATE ORDER FROM W. & C. SCOTT & SONS, EFFECTUALLY ESTABLISHES THE SUPERIORITY OF THE

## PAINE FILLED BALLS AND THE HUBER TRAPS.

Dec 13 1m

## Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

DEAR ROYED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$5.

W. & C. SCOTT & SONS have ordered 10,000 balls and 24 traps to be sent to England.

## AND

## GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM;" AUTHOR OF THE "FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen: It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America. It designates the proper places for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 27 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for best judgment fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

## WILD PIGEONS (*Ectopistes Migratorius*).

THE Autumn sky is fleck'd with gold,  
As slow the western sun declines,  
The floating clouds' ensanguin'd fold  
With a resplendent glory shines;  
And as the glimmering shadows creep  
Across the fading landscape's breast  
And o'er the purpling mountain's sweep,  
The drowsy breezes sink to rest.

The roc-buck to his thicket goes,  
Where dense the wood its covert throws  
The red stag that had paused to drink  
Beside the rivulet's plashy brink  
Exhausted flings his dappled side  
Along the cool, transparent tide—  
'Tis there the pigeons seek the wood  
To roost, a blue-wing'd, muttering brood.

Deep in Wisconsin wilderness,  
In forests dim of Michigan,  
The bending boughs their bosoms press,  
The air their clanging pinions press,  
So vast their numbers, hunters say  
They sweep the bough and break the spray,  
And oft their startled millions rise  
With roar, like thunder of the skies.

Years since, in wild woods of the East,  
They gathered to the harvest feast;  
They swarm'd by river and by shore,  
In vast flocks flew the pastures o'er;  
They swept, innumerable, the plain,  
Gleaning the corn-field and the grain—  
Then, winging to some wood their flight,  
Settled in roosting-place for night.

When emigration, toward the West,  
In restless emulation press'd,  
And ax and plow, and farmer's toll,  
Open'd the furrows of the soil;  
And myriad acres of the wheat  
Yellow'd in Summer's sultry heat;  
And bearded rye and golden corn  
Shook their bright tresses to the morn—  
Then, to these sumptuous pastures new  
These wing'd, devouring robbers flew.

When June, with rose-red cheeks aglow,  
Broadcast, wild strawberries clothed srow;  
When August, on the sun-bright hills,  
With nectar the ripe blueberry fills;  
O'er all the heated pasture pours  
The blackberry in honied stores;  
And ripens on the swinging vine  
The grapes, like amethysts that shine—  
Then to this rich, luxurious fare,  
So prodigal, the flocks repair,  
Rejoicing in the festival  
That bounteous Nature yields to all.

ISAAC McLELLAN.

For Forest and Stream and Rod and Gun.

## Voyaging on the Upper Missouri.

By ERNEST INGENSOLL.

THE sources of great rivers are invested with a certain romantic interest. The mind follows a mighty flood to its small beginnings as naturally as it asks the causes of strange phenomena or studies the birth of a great man to find some sign of his future eminence. If the springs of the Nile have been sought with unwearied patience and reckless outlay of treasure until they have become almost as fabulous as the alluring fountains of *elixir vita*, because the whole race was curious to solve the riddle of the sacred river's origin, the writer need not beg pardon of the reader in proposing to take him to the very ultimate head of a river twice the length of the Nile—our own Missouri.

The Missouri rises in the Rocky Mountains not far west of the National Park, where the Main Range divides Montana from Idaho. This water-shed is prolific of rivers, three branches of the Missouri, the Yellowstone, two confluent of the Snake (which forms the Columbia), and the Green River (that finally becomes the Rio Colorado), taking their rise within a few leagues of each other.

High on the northwestern slope of these mountains, in longitude 112° and latitude 44½° approximately, the meltings of the snowbanks trickle into a little marshy basin. This overflowing, a slender rivulet finds its way down through

devious and rock-obstructed channels, tumbling and foaming as is the custom of snow-fed torrents, until it gets away from the spruce forests and winds out northward among the foothills, from whose color it receives its name—Red Rock Creek. Then is added to it Horse Plain, Grasshopper, Rattlesnake, Beaver, Black Tail and some other creeks, outlets for mountain snows, which together form a river called by Lewis and Clarke, more than seventy years ago, Jefferson River, in honor of the President of the United States. A hundred miles farther on this is joined by the Madison and the Gallatin, the christening is repeated and the united streams become the "Missouri," which name in turn is exchanged for "Mississippi," just above St. Louis. But the stream I have traced is the real Father of Waters, and there is little reason why it should not be known as the Missouri, or else Mississippi, from the Red Rock mountains to the Gulf of Mexico. That makes a river to be proud of—a river navigable by large steamboats for 4,000 miles, and draining 1,250,000 square miles of territory.

Leaving out of the question the expedition sent northward by Cortez and his successors, which never wandered so far, the earliest exploration of the West was guided by this water-course, and more than a century ago white men, notably Le Sieur de la Verendrye, in 1743-4, had penetrated to its headwaters, although, perhaps, without recognizing the true geography. The trappers of the fur companies scattered more and more widely through the gorges, and their stories fired the zeal of Lewis and Clarke, who reached the Forks of the Missouri in 1804, and passing through the valleys southeast of it, gave names to the streams and mountains, names which, unfortunately, have largely been replaced by more modern but less worthy ones. Yet it was not before the discovery of gold mines in 1862 brought eager crowds to Montana that anything in detail came to be known about the sources of the Missouri, nor until Dr. F. V. Hayden went there in 1871 was the region begun to be surveyed. Even now few persons will undertake to guide a party through this wilderness of mountains, and with the exception of two skirting stage routes there are no roads; while travel continues to be dangerous on account of prowling bands of Indians.

The scenery along the parent streams is striking and beautiful. Noble mountains are piled to the sky; distant gray plains stretch into blue indistinctness; pleasant valleys open here and there embowered in foliage through which you catch the sparkle of icy brooks. The Rocky Mountains at this point are broken into a vast irregular group of granite peaks, snowy atop, and lower down bristling with sharp pinnacles and studded with mighty crags or detached masses of basalt and caps of purple porphyry that stand beetling above the spruces and firs, or crop out of a grassy slope as an Indian's sinewy shoulder protrudes from his blanket. The stratified conglomerates, marls and sandstones have weathered into quaint architectural forms, and add picturesque to the scene. Tumbling and leaping in rash haste, the young rivers rushing to their rendezvous, meet with many an adventure: here plunge headlong down the ledges, there quietly meander through a valley spread widely between banks that bear blooming gardens, anon gathering their forces to run the gauntlet of some canyon between brown walls hundreds of feet high, whose strata, heated to pliancy, the hand of geologic force has some time gripped so tightly that it has distorted and crumpled them as I might crush this sheet of paper in my fist. Such is the history of the Jefferson, which, eluding the tremendous cliffs that stand in its way at Beaverhead, gradually widens and pursues an even way through extensive valleys of fertile, red-dish soil, bounded by pine-clothed foothills sweeping up on either hand in fine contrast to the gentle curve of the broad, drab meadow.

The Three Forks is the point of junction of the Jefferson, Madison and Gallatin, and is 250 miles from the sources of the first-mentioned. The Madison drains the geyser basin of Yellowstone Park, flowing almost directly northward through magnificent mountains and attractive valleys. Between it and the Gallatin, the smallest and easternmost of the three, is only a range of hills, at the end of which the trio come together with much swirling of stranger currents and eddying of newly mingled waters, each losing its identity, and all flowing hence to the Missouri.

I was there last August, and although the summits of the mountains hemming in the valley were streaked with snow—a picture of winter—at their base summer reigned. The courses

of the streams, with their many cut-offs and sloughs, are marked by graceful lines of cottonwood and black alder, by islands clothed with verdure, and by jungles of sweetly fragrant wild currant, as they pass through the wide park. The soft carpet of olive-brown bunch-grass, the sheen of the waters seen between the groves, with the shadowy forms of the silvery-rimmed mountains in the distance, made in the twilight a rarely enchanting landscape.

A town has been elaborately laid out there with the high hopes that animate all Western settlements, but thus far a flouring mill, some stores, a race-course and a few inhabitants comprise all there is of Gallatin City. The place is annually the scene of exciting races upon "Cayuse" ponies, when ranchmen from the Gallatin and Madison valleys—both of which are filled with marvelously productive farms—meet miners from the surrounding mountains to stake gold dust against flour and bacon on their favorite nags.

Here my personal experience of the river ends, to be resumed at Fort Benton, 250 miles below. Nevertheless, as I followed its general course much of the way to Helena, and caught sight of it often between Helena and Fort Benton, I might be able to give a sufficiently accurate description of its troubled passage for this distance. But fortunately there is at hand the excellent account of Mr. Thos. P. Roberts, who, in 1872, made a boat journey for the survey of the river course from the Forks to Fort Benton. To his entertaining narrative I am therefore indebted.

At first the river is 500 feet wide and a fathom deep, the banks varying from rocky hills to open grassy knolls. Then a picturesque canyon of reddish rock is wriggled through, and beyond that for fifty miles its waters are worried by boulders, islands and rapids, here elbow'd out of their straight track by the pushing of hills, and there lured from it by the breadth of prairies where herds of splendid cattle come down to drink. After this the river gathers itself into a narrow channel to glide with the stillness of profound depth through the canyons of the Belt Mountains, separating central Montana from the buffalo plains. On the sides of some of these canyons rounded rocks of great size are piled, tier on tier above each other, like cannon balls, to a height of five or six hundred feet; in others the frowning cliffs are solid, rough-hewn granite, with deep black clefts here and there, and occasional jutting ledges where great yellow pines get foothold and cast pointed shadows across the narrow gorge. The last of these canyons is the most remarkable of all on the Missouri.

"Not until we were within the portal," say the surveyors, "and the sunlight was shut out from behind us, did we fully realize how closely the river is here locked within the embrace of the mountains. For two miles ahead a wonderful vista now began to open out, and still there was visible no outlet to the turreted and pinnacled walls which penned us in. Higher the walls grew, and darker and more sombre became the shadows, while a solemn stillness seemed not only to pervade the air, but the water, which, fortunately for our observations, flowed sluggishly along. \* \* \* \* High up on either hand were colossal statues, carved by the master, Time, in the niches of this gigantic winding hall, five miles long. The walls rose majestically six hundred, eight hundred and one thousand feet high, and in places appeared to rest against the white clouds above, which completed the arch over our heads. The sides afforded no foothold for man or beast, except occasionally, up through lateral fissures, in whose dark recesses lay tumbled in rare confusion huge broken pillars and angular rocks, jammed, and forming natural bridges from chasm to chasm."

"Down the river, midway in the canyon, at the principal turn to the left, the wall actually hung over the river, so that a plummet-line six hundred feet long dropped from the brow, would have struck our boat as we passed beneath it. Pine trees fringed the summit, and struggled for an existence in some of the crevices, some of their tops pointing downward, and many were broken off where the superincumbent growth was too weighty for the slight hold of their roots.

"We longed for the pencil of a Bierstadt or a Moran. Such grotesque forms, such heights, such depths, such lights and shades as here presented themselves, were far beyond the power of pen to illustrate. Words may exaggerate points, but no descriptive language can do justice to this scene. During our speculations the boat drifted around and around as it slowly floated past the 'Black Crook Dens' skirting the deep

river, which nowhere through the canyon is more than three hundred feet wide. Although not a breath of wind was stirring, we all noticed sudden changes in the temperature as from time to time we passed through strata of air, now warm and now twenty degrees cooler, which atmospheric phenomenon we could not account for. A slight rustling from the top of the cliff on our left suddenly attracted attention, some small stones beginning to drop and splash in the water near us, presaging perhaps grave disaster that might entomb us under the mountain's huge weight; but presently the practiced eye of Mr. Scott, 'the third mate,' an experienced miner, mountaineer and surveyor, detected the cause of our alarm. It was a mountain sheep, or 'big-horn,' looking down from the dizzy height, and stamping his feet with no puny rage and evident dissatisfaction at the strange creatures far below him."

This is the "Gate of the Mountains" of Lewis and Clarke; and Mr. Roberts thought it more effectually gratified the lover of what is grand in nature than even the frightful gorge of the Yellowstone, where is much that is soft and pretty to distract the eye from the raging flood three thousand feet below, while the imposing desolation of the Missouri's canyon is unrelieved.

As one travels between Bozeman and Helena, or glances eastward from the streets of the capital, his eye overlooks all of this canyon region and then marks the course of the river, but can never catch a glimpse of its buried waters. It is a landscape of broad beauty, with the mighty landmark of the Bear's Tooth as central figure. The foreground slopes gently downward in miles of yellow undulations, with here and there a bare reddish knoll and scattered lines of green willows, where brooks meander, watering verdant patches of grain. On the further side the plain swells upward into gray hills, and behind them tower terraces and bluffs of larger build and darker hue, standing out in front of the real mountains carved in firmest outlines of ultra-marine, with few details of shape or marks of light and shadow, crowned, far beyond, by the coruscant gleam of snowy crests flashing like curved falchions against the sombre background of the sky. Could any one weary of such a picture?

Thus between black and red walls fiercely, and lazily through sunny meadows, rippling over sand-bars and plunging down rapids, intercepted by many a charming island, making the acquaintance of scores of noble trees, drank of by elk and deer and mountain sheep, its shallows full of beavers and otters, its pools the home of trout and whitefish, its banks haunted by strong-winged wild fowl, and nourishing rich tracts of cultivable land along its branches, the noble stream rushes onward to cast itself over the Great Falls. After a long placid sleep between banks of rich prairie, where sunlight enters, the river arouses itself, and, springing forward, drops twenty-six feet vertically. Then the water pitches down a long series of cascades and pours over a curving ledge, fifty feet high, in one unbroken sheet, with vast uproar and banners of smoky, rainbow-lit spray. Extricating itself from the turmoil of this leap, the river, churned and lashed into continuous foam, rolls swiftly down between abrupt and crowding banks, and with the whole tremendous power of its pent-up current, precipitates itself down the rough steps of a broken precipice, at one place ninety feet in height. The final descent is a sublime spectacle, and the noise is like that of Niagara; but neither the gorge below, filled with the waste and waste of waters, nor any of the accessory scenery approaches in that just commingling of grandeur and beauty, the superb landscape where Niagara's fitful flood, verdant as liquid malachite, spins in its whirlpool and swings majestically down its canyon into the bosom of Ontario.

The country about these falls is one great dry, rolling plain, covered with bunch grass, which pastures millions of buffaloes and antelopes. The river cuts its way deeper and deeper into this plain, descending 350 feet in half a dozen miles, leaving abrupt cliffs of reddish jurassic rock and bluish clay, through which deeply cut ravines open down to the water. These cliffs show boulders, protuberances and detached fragments, often wrought by the chisels of water and air into grotesque similitudes of artificial objects. The soil is fertile, but the severity and length of the winter make success in agriculture always uncertain. The climate is that of Quebec.

(To be Continued.)

For Forest and Stream and Rod and Gun.

#### AMONG THE PACIFIC ISLES.

OUR good ship, bound from Boston to the Sandwich Islands, passed through the Straits of Lemaire, and one fine morning in February (midsummer in the southern hemisphere) arrived off Cape Horn. Few old navigators get such a fair view of this storm-breeding promontory as we had that day. The weather was comfortably warm, the air clear, and a gentle, four-knot breeze blowing from the north-east. All sail was set to main top-gallant studding sail, and all hands, including some forty passengers, were on deck. As we gazed on the famous and dreaded rock two miles distant, it was hard to realize that many vessels had buffeted the tremendous seas for fifty and sixty days in the vain endeavor to round the Horn.

But three days after we had a fair sample of the treacherous weather of this much vexed region, where the gales and the billows of two grand oceans seem perpetually contending for the mastery. The morning and afternoon had been moderate. The long table in the cabin had been set for supper; the sky-lights and companion-way were open; the steward was just about ringing the bell, when suddenly, as if a lion had sprung from ambush, a tremendous wave broke on our quarter, flooded the deck, and poured down the sky-lights and companion-way. Such a wreck and ruin! Such a mixture of applause and children, of women and tea (externally applied), salt water, salt beef, wet men, fragile dishes and hard tack, butter and boots, I never have beheld! To all this rumpus below add the fierce shouts of the officers on deck, the frantic efforts of the whole crew, steward and cook included, to shorten sail, the shrill scream of the wind and the loud flapping of the canvas and you will have some idea of the dire confusion which took the place of our quiet tea. In less than half an hour we were under bare poles with a piece of tarpaulin about a yard square triced up in the mizzen rigging. There was no swell. The wind blew a hurricane from the north-west, smothering down the sea, which was perfectly white to leeward and for a mile or so to windward. There

the sky and ocean seemed to be cut in two. Beyond that line the sky and water were of a dense blue black, indistinguishable one from the other. This region of murky gloom advanced rapidly toward us. All at once the captain exclaimed with a tone of horror: "Look! It is a water-spout, close aboard! We are lost!" And there it was, straight ahead, roaring like Niagara, and coming like a race-horse, bearing with it that black pall as clearly cut as a curtain. The panic which ensued I have never seen equaled either on the battlefield or when bumping on a coral reef off the dangerous coast of Lower California. The captain lost his wits; the crew, some of them, actually fell down on their knees and prayed. Women fainted, children shrieked in ignorant sympathy, and strong men turned pale. But before the prayer could be finished—before the lady who had fainted at the top of the companion-way had slipped to the bottom, the danger was over. I happened to be standing by the man at the wheel when the alarm was raised, and partly through ignorance and partly from panic imitation of him, merely stared at the roaring, raging, seething monster. In an instant, the twisting column had driven past our stern, apparently not twenty feet from it, and before we had recovered ourselves appeared long, black, serpent-like, reaching to the clouds, miles to leeward and ahead of us, off our port bow.

"If our sparker boom had touched it, there wouldn't have been a piece of this ship left as big as a chip," said the man at the wheel. We two had the best view of the spout, and both were sure that it was not complete at the time it passed our stern. Though the column of water was much higher than our masts it did not then join a similar nucleus from above. It was probably in the last stages of formation.

Since this providential escape I have never been at a loss to account for vessels "missing," as they are classified by the insurance companies. Off Cape Hatteras I have seen scores of waterspouts at once on the edge of the gulf stream. Imagine a vessel running into one of these in the night—what would there be left to tell the story?

Off Cape Horn we caught a few albatross with a hook and line. Next time I go I shall take a stout rod and reel, and try what sport these huge birds will give to the scientific angler. After putting the customary collar and message on them we let them loose. As we ran into the trade winds and warmer latitudes of the Pacific, dolphins began to appear. The ordinary tackle of the sailor—line hooks and white rag—was all we had, but the sport afforded great fun to the voyagers weary of the sea. I should think that with a good bass rig the dolphins might give as much sport as the bluefish. I was not much impressed with the iridescent colors of the exploding dolphin. The ordinary soup is far more beautiful in its death agony.

One day it fell calm and I had my first view of the shark. The mate called my attention to two fins some distance astern, and soon all the passengers were on deck to witness the capture of these monsters. By throwing overboard a few fragments of bait, three were soon enticed under the stern. The mate tried first with the harpoon, and succeeded in cutting the smallest one in two. The other two immediately retreated with him to unknown depths, whether to nurse or to eat him I cannot say. At any rate, they soon reappeared without him. The large shark-hook and chain, baited with pork, was then let down over the stern. To see the leisurly, glutinous, self-confident manner with which the rascal turned over and swallowed the mass would nerve a saint's arm with hatred. The mate lanced and killed him in the water, being rather particular about his decks. It was announced that we should have some shark for supper, and the officers and old sea-goers among the passengers occupied most of the afternoon in praising to the ladies the flesh of the shark, and relating many instances of money, jewels, and other valuables found inside these voracious fishes.

When we gathered at the supper table there was quite a buzz of pent-up excitement among the ladies and young people. The boiled shark was duly served, when, "Oh! my!" exclaimed a lovely girl of eighteen, and picked out a Spanish quarter from her piece of shark. The coin was passed around and inspected, and many a conjecture made as to where the shark got it. As the combined imaginations wove a romantic tale of a shipwrecked Spanish galleon, freighted with booty, beauty and booty, the old sea-goers exchanged furtive smiles. Meanwhile, every morsel of that boiled shark was chewed fine and carefully swallowed by eager treasure-seekers. Not long after I overheard the mate saying to old Captain B., the oracle of the cabin: "Waal, if that wain't with a quarter, I want ter know." If the reader has never eaten boiled fresh shark, I will tell him how it tastes. Suspiciously like boiled salt cod, long soaked.

It was some months after this that on a fine autumn morning, King Kamehameha's royal yacht, a fast and commodious Boston built schooner, slowly floated out from the harbor of Honolulu. We were a party of a dozen ladies and gentlemen, who had chartered the yacht from her august and dusky owner for a trip to Hawaii and the famous volcano of Kilauca. The crew were natives, but the captain was a full blooded Yankee. The view of the island of Oahu from seaward is lovely, especially to those who have made a long voyage around Cape Horn from the states. The town nestles on the shore at the northern end of a long, flat plain. In the back ground the eye may trace the road leading up the beautiful Nuuanu Valley, past villas and cottages toward the almost unknown and uninhabited regions in the centre and eastern parts of the island. To the right of the Nuuanu Valley rises the cone of an extinct volcano whose oval, grass grown crater has given it the name of the "Punch Bowl." At the extremity of the plain a bold, high cape projects into the sea, fringed at its base with coconut groves, called Diamond Head, the land-mark for vessels bound to Honolulu.

As we glided through the channel between the reefs we gazed with admiration on the natives—men, women and children—disporting themselves among the breakers with the fearlessness and fun characteristic of the Kanakas. As we left Diamond Head astern the wind died away and left the Kamehameha III, at the mercy of the provoking swell which runs between Oahu and Mani. If anything will bring on seasickness, that cross swell will. I can only compare it to a mixture of the British Channel and the Straits of Gibraltar after a westerly gale has given way to an easterly breeze. It has the viciousness of the former and the length and depth of the latter. But we were proof against its power, with one or two exceptions.

The next morning we were running along with a lively breeze past Mani and Molokai enjoying to the full the poetry of motion in a tropical sea. And here let me confirm all that has been written by voyagers like Cook, and romancers like Herman Melville as to the fascination and delight of pleasure sailing and exploration in the tropical parts of Polynesia. Content yourself with what nature furnishes on a grand scale,

but do not look at the doings or condition of the native man and his companions. Hideous poultry, wretched dogs and a decaying race of human beings will repel you in disgust.

I long for the day to come when the Pacific coast of the United States will have a fleet of yachts like that of the New York Squadron, when this ocean shall become a favorite cruising ground, and when some enthusiastic and intelligent author shall fully describe and amply illustrate the beauties of the island world. No new field for the artist or the litterateur is fairer or more enticing. As we ran in under the lee of Hawaii a dead calm set in before we could make Hilo, our destined port. The coast of Hawaii here rises almost perpendicular and is of the peculiar blue-green of the Pacific, a shade unknown on our Atlantic coast, but of which one is reminded off the Mediterranean shore of Spain. Directly ahead of us we could trace the silvery thread of a cascade falling from the brink of a precipice into a tiny nook on the shore. We were assured that this fall was nearly 1,000 feet high, and that the valley was only accessible by canoes from the sea. Romance also pictured a small colony of natives there in undisturbed and native innocence, *a la* Typee and Osnoo. I used to believe that sort of nonsense. Now I have adopted the faith that all savages are dirty, beastly and cruel. In the background of the interior the land rose and faded dimly blue toward the enormous peaks of Mouna Loa and Mouna Ken, each nearly 14,000 feet high.

The next morning we were at anchor off Hilo and soon conveyed ashore to enjoy the kind hospitality of Dr. Coan, the resident missionary. Pending the preparations for a start the next morning we took a stroll to the falls of the Waikuku River. This is, or rather was, a considerable torrent, which, pent up by precipices to the width of six feet, falls in a solid pound sheet about twenty feet into a deep basin below and thence into the sea. The whole configuration of the country has probably changed ere now many times, owing to the earthquakes and volcanic eruptions. The river may still exist and it may not. If you ever visit Hawaii you must not expect to find the places visited to correspond with the descriptions you have read.

The cascade presented a lively scene, such as, I venture to say, none of the great continents has ever presented. Natives of all ages and sexes were tumbling, gliding, rolling, diving from the river above over the falls down into the basin below. The compressed stream made so impenetrable a column of water, as it rushed over the ledge, that the heaviest man was carried on its surface like a chip over the brink into the raging, foaming caldron below. There he would disappear and emerge laughing and joyous from the stream a dozen or twenty yards below. There was a constant succession of these adventurous bathers, all merrily vying with each other to get back first to the top of the fall. It reminded me very vividly of New England boys "coasting" down hill in winter, and could be fairly called its converse or complement, as the swimmers came rushing down at railway speed, some head first, some feet first, some sitting down and others arm in arm.

The next day at dawn we set forth on mule-back and horseback for the volcano, distant about forty miles, attended by a train of natives as guides and carriers. The first night was passed at the half-way house or hut, which had a thatched roof, three sides and a front doorway, occupying the whole front; no door. Toward afternoon, as we carefully picked our way over the black, desolate lava plain, 8,000 feet above the sea, now looking down carefully to avoid the air, fire, boiling water, steam and sulphur fumes, anon glancing up in wonder at the stupendous snow-capped dome of Mouna Loa, we were abruptly stopped. We had reached the edge of the great crater. No separate descriptions of Kilauca can ever be alike, and only the greatest of artist's pen or brush can do justice to its grandeur. In simple words, here, let me call it a great hole, thirteen miles in circumference, and from 1,200 to 1,500 feet deep, punched in the middle of a vast plain. In the southwestern part was, at that time, a lake nearly half a mile in diameter, of liquid lava. About half way down to the crust of black lava which made the precarious and ever-shifting bottom like a surface of black ice, there ran a well-defined line around the perpendicular side walls. This marked the point to which the crust had been uplifted previous to the last eruption. Just think of the enormous amount of white, hot, running lava that must have been emptied out of this huge pot, and what desolation it must have wrought on its way to the sea. A mass thirteen miles around, and from 500 to 600 feet deep, was to be accounted for.

We passed two days here. The view at night was more impressive than all the *feets* of Napoleon in Paris—wild, fantastic, horrible, yet fearfully fascinating. By day we descended to the bottom and trudged over to the lake. Those who have seen in iron foundries a pot of white hot metal will please imagine a pool of it, half a mile long, spurting jets a hundred feet and more into the air, with reports like cannon, commencing white, turning red and then black, and falling back solid (so quickly does lava cool) into the boiling, exploding, raging pit below. It seems as if Milton must have seen Kilauca.

As we cautiously picked our way back over holes and cracks and thin lava crusts, we realized the danger of the excursion. A native always goes before, sounding the way with a pole, and often deviating from a direct course to avoid tumbling through the thin and brittle covering which alone separates us from the fire below.

What a sight it would be to look at the whole vast crater in fierce activity from the top of Mouna Loa, 8,000 feet above. Will mortal man ever behold it?

One day sufficed for the journey back to Hilo, and now for my shark.

As we lay becalmed off Hilo next day one of the gentlemen must needs go in swimming. He had not seen any sharks, and he did not believe there were any. In he plunged, and paddled about for a few moments. He had regained the deck not a minute before Mr. Shark put in an appearance, with a wicked and hungry eye. This brought the ladies on deck and the shark hooked out of its locker. In as little time as it takes to tell it, so intent on business were all parties, the monster was hooked, a bowline slipped over his tail, and he hoisted aboard. As he struck the deck the bowline slackened and came off, and the hook dropped out of his mouth. The cook aimed a terrific blow at the monster with his ax, missed and planted it solidly in the deck, while the shark knocked him flat and ten feet away. Such a scrambling is seldom seen. All hands made for the rigging and the ladies for the cabin. That shark fairly captured the schooner, and held possession for awhile. At last he was tempted to try to chew up a big log of wood, and during this process was knocked on the head. Nobody cared to eat him, but his backbone was made into a walking-stick, and his enormous jaw, mangled, and preserved. H. D. J.

THE GULL RIVER WATERS.

BALSAM LAKE lies at the terminus of the Toronto and Nipissing Railway, and is about ninety miles distant from the City of Toronto, in Canada. It is surrounded by land of poor quality, in places scarcely cultivable, but on the shores of the lake are several farms that, by energy and persistent hard work, have been cleared and brought to a higher state of perfection than one might think possible at first sight of the virgin land in the locality.

Balsam Lake is at the head of a chain of waters—small lakes—of, approximately, from four to fourteen miles in length, and short links of river that extend as far east as Rice Lake, including in the chain Lakes Cameron, Sturgeon, Pigeon, Buckhorn, Stony and Clear. Out of Rice Lake these waters find their exit by way of the River Trent into the Bay of Quinte, Lake Ontario. Early in the history of Canada these lakes formed one of the by-ways used by H. B. voyagers on their return from Montreal with stores for their posts in the Northwest. To-day these hardy adventurers have given place to the fisherman and tourist whose summer camp-fire lights up by night a scene of comfort and ease that would contrast strongly with the old-time bivouac of swarthy voyagers, whose camp appointments were very simple—an overturned canoe the usual shelter. The fishing in these lakes consists of bass and muscalonge, and, of course, the dozen other varieties found in like waters—perch, sunfish, catfish, suckers, etc.

The country about Rice Lake to the south and north has been settled for many years. This lake is twenty-two miles in length, and from two to four miles wide. It is famous for its muscalonge and bass fishing, which even at this late date is probably better than in any of the lakes more remote from settlement. Its wild rice attracts many duck, and in October and the early part of November every available point and every island, at all favorably situated, is occupied by a sanguine sportsman. Decoying is the method of capture usually employed, but for ten years past the number of ducks visiting the lake has been rapidly diminishing; and although ten or fifteen years ago, with less destructive weapons than are in vogue to-day, our sportsmen were able easily to bag from 30 to 100 ducks. From five to ten is now considered a good average number.

Rice Lake is probably the most beautiful of our back lakes in the Province of Ontario. It is connected with the town of Cobourg, on Lake Ontario, by the O. P. & M. Railway, fourteen miles in length. In the vicinity of most of the lakes above-named deer are still to be found, but only in some localities is the hunting really good, notably at Deer Bay, Buckhorn Lake, and north of Balsam Lake. Of course there are fifty localities within the province that afford capital sport and deer in plenty, but I am confining myself just now to a meagre description of what are commonly known as the Gull River Waters. Many a town-weary Cannuck finds full enjoyment in canoeing down the chain, making it a two weeks' journey, which allows plenty of time to insure comfort. If the weather is wet or stormy he need not pursue his way, but may employ himself "within doors" in arranging fishing tackle, in reading or in companionable talk.

Buckhorn Lake has some very beautiful scenery, and at the narrows, between it and Pigeon Lake, the country on either side, as you enter Buckhorn, has the appearance of a grand park, oak, beech, maple and balsam trees lending their varied tints to the landscape. The lower part of Buckhorn Lake, after the rapids are passed, is full of beautiful little rocky islets, covered with bright vegetation, very similar to those on the north shore of the Georgian Bay. There is very little settlement about Buckhorn; the land is poor close to the lake, and deer, partridge and ducks abound during September and October.

R. A. R.

Fish Culture.

FOURTH ANNUAL REPORT OF THE COMMISSIONERS OF FISHERIES OF WISCONSIN.

THE Fish Commissioners of the State of Wisconsin—this board consisting of the Governor of the State and Messrs. Wm. Welscher A. Palmer, P. R. Hoy and H. F. Donsman—in presenting their report for the last year, ending September, 1877, follow in the wake of many other commissioners by calling attention to the necessity of taking steps to compel the making of fishways around dams constructed across Wisconsin rivers and streams. Cases are cited of fish always caught at the foot of dams precisely in the season when their instincts led them to ascend for the purpose of spawning. Accordingly, the commissioners, in compliance with the request of numerous citizens, will call the attention of the Legislature to this subject.

In a former report an account of operations at Milwaukee and Madison was published. The process of fish breeding has apparently been carried out quite successfully in regard to trout, not, as the commissioners very wisely state, "while the cultivation of the whitefish must ever constitute our leading purpose, and the lake trout next, we are nevertheless assured that the public want requires that the speckled trout shall have a place."

From Milwaukee over 1,786,000 lake trout fry and 6,300,000 young whitefish have been distributed. This distribution of 8,000,000 young fish is quite remarkable in itself for an establishment not more than a year old. When one learns that the cost of the young fish was only fifty cents a thousand, and that the expenses of distribution only amounted to \$227.15, we may safely state that the commissioners have managed the business entrusted to their care with great good judgment and economy. Mr. Donsman, the commissioner in charge, thinks that with new appliances some twelve to fifteen millions of whitefish spawn can be collected this year with the same outlay as last year. Mr. Welscher furnishes an

interesting contribution to the report in his special paper on fish hatching. Mr. Welscher states that about 182 days is the time it takes the eggs of the lake trout to incubate, but that 140 to 165 days were necessary for whitefish. Mr. Welscher further adds, "Now what I claim is this—that lake waters are the only proper waters for hatching lake fish, and that a long period of incubation is most essential and necessary to produce good, healthy fish. Also, by hatching the ova in water at a low temperature, and the consequent duration of incubation, it brings out the young fish in the spring months when the bright, warm days of April and May have removed the icy coat from the lakes and streams," and accordingly that young fish have a better chance. The report of the Wisconsin commissioners is an exceedingly able one, and bears many evidences of genuine interest in the labor undertaken.

AMERICAN FISH CULTURISTS ASSOCIATION.—The regular meeting of the American Fish Culturists Association will take place on February the 27th and 28th at the room of the Directors of the Fishmongers' Society of New York, over the wholesale market, foot of Beekman street, New York. A large attendance of the leading fish culturists in the United States and the Provinces is expected. The officers of the association are: The Hon. R. B. Roosevelt, President; E. G. Blackford, Treasurer; B. Phillips, Secretary. Besides numerous papers of interest on leading topics the sections organized at the last meeting will report as follows: On Methods of Fish Culture, Messrs. Green, Porter and Wilmot; on Fishing Laws and Fishways, Messrs. Everts, Stone and Ferguson; on Natural History, Messrs. Milner, Mather and Haddock; on Fisheries, Messrs. Blackford, Phillips and Edmunds.

THE WESTERN IOWA FISH ASSOCIATION.—The Western Iowa Fish Association have been doing a great work for this section of country, and the results of its labor are now becoming apparent. The members have worked with great zeal and without a cent's worth of expense to the people to stock the streams in this part of Iowa with the best varieties of good fish that could be obtained from the State hatching-house at Anamosa. The first fish received was on the 7th of June, 1875, and consisted of ten thousand Penobscot salmon, which were distributed by Mr. D. W. Crawford and Mr. A. C. Graham as follows: three thousand in the Boyer River and two thousand in one of its tributaries. Three thousand were planted in the Mosquito and two thousand in Willow Creek in Shelby County, which is a small stream that flows in the West. Some of these fish have already grown to a very fair size, and occasionally one is caught. In February, 1876, the association received 85,000 land-locked salmon and 15,000 Mackinaw trout. Messrs. Crawford and Graham, assisted by State Fish Commissioner Shaw, put 5,000 of salmon in the Little Mosquito, 5,000 in Keg Creek, and 5,000 in Spring Creek. They also placed 14,000 of the Mackinaw trout in the same streams. Mr. Cooper and S. C. Bowman took 15,000 of the salmon to Big Lake, 5,000 to Haulhorn's Lake, 5,000 to Pigeon Creek, 5,000 to Honey Lake, and the remaining 30,000 to small streams tributary to the Pigeon. The remaining 1,000 Mackinaw trout were placed in Mynaster's Spring. On June 29, 1876, 2,000 eels were received from the State Fish Commissioner, 500 of which were put in Big Lake by the late S. C. Bowman, 500 in the Mosquito at Park's Mill by George Parks, and 500 in Keg Creek by A. C. Graham and D. W. Crawford. The remaining 500 were put in smaller streams. In October, of the same year, Mr. Shaw delivered a lot of striped, rock, black and white bass, wall-eyed pike, croppies, sunfish, perch and a few other varieties, all taken from the Mississippi River. There were about 10,000 in all, and the varieties were all new to our waters, and some of them were large enough to breed. S. C. Bowman took part of them to Mosquito Creek, and Mr. Campbell the balance to Keg Creek. Later in the month Mr. Shaw made the association another shipment of a few large bass and perch, some of which weighed two pounds. These were planted by Mr. A. C. Graham in the Mosquito at Park's Mill. Thus it will be seen that about 125,000 eels have been procured by the association from abroad and distributed. But this is not all they have done. Mr. Graham made application to the Board of Supervisors last fall for funds to enable him to seine the sloughs on the bottoms, in which there are hatched millions of young fish every summer, and distribute the same in the running streams further inland, and he was granted \$50. With this sum men were hired and about 50,000 bass, croppies and wall-eyed pike were caught and placed in Keg and Mosquito Creeks. This was the only assistance the association has had, and we think they are deserving of great credit and should be encouraged.—Council Bluffs (Iowa) Nonpareil.

MINK INFESTING TROUT PONDS.

Seth Green, Esq., has favored us with the following letter in reply to a correspondent who asks him how to get rid of mink which infest his trout ponds:

ROCHESTER, Dec. 27, 1877.

MR. LAND: Dear Sir—Yours of the 20th is received. In answer I will say that I have been troubled with minks, and the way I got rid of them was to set traps and catch them. The chances are that there are not more than one or two minks which visit your ponds, and if you do not kill them they will kill every trout in them. One or two mosquitoes will bother you all night if you keep brushing them off, but if you let them light and then take sight and kill them sure you will not be troubled any more. It is the same with mink or rats. I keep traps set about the State ponds all the time, and when any vermin visit them they get caught. Mink are great travelers. A number of years ago I was fishing through the ice in the North Woods for salmon trout. I had a pond that I kept live bait in. A mink with one fore foot gone got in my pond one night and killed nearly all my bait. The next day I saw his track twenty miles from the pond, and the next night after I caught him in a steel trap in my pond. I have caught four mink this winter in the neighborhood of the State ponds. No fish preserves are safe without traps. A good rat dog is a good thing to have about your premises, and all kind of vermin—including burglars—know every house that keeps a good watch dog. Yours,

SETH GREEN.

[Perhaps minks are the cause of many depleted ponds which are supposed to have been poached.—Ed.]

Natural History.

A FIGHT FOR LIFE.

EDITOR FOREST AND STREAM:

Once witnessed a singular contest in strategy between a duck and an eagle, which may interest your readers. My friend and I were duck shooting upon the lakes in Northern Wisconsin. We were shooting from a railroad bridge that crosses the northern end of Lake Beau de Mort, through which flows the Fox River on its way to Green Bay. Our method was to conceal ourselves as much as possible by crouching low upon the stringers and lower timbers of the bridge, and drop our game as it flew over us within easy range. It was a beautiful autumn morning, and I had just fired my first shot, winging a blue bill, which dropped in the water a few rods above the bridge. I was just about to complete my imperfect work by giving the duck the contents of my remaining barrel, when I was startled by a most unusual sound. The air quivered with the rush of lordly wings, and, almost with the rapidity of lightning, a magnificent bald eagle, swooping from his flight, darted for my wounded duck. But with an equal celerity the duck disappeared beneath the surface of the water. And then began one of the most interesting displays of sagacity, and determined contests for food on the one hand and life on the other, that it has ever been my fortune to witness. It lasted for over an hour and a half, and although my friend and myself could have killed both the eagle and the duck at pleasure any time during the contest, we seated ourselves on the bridge and watched with peculiar interest the most singular scene which followed. The instinct (shall we not call it reason?) manifested by both parties was most remarkable.

It is a well-known fact that when you essay to capture a winged duck from a boat that it will seek to preserve itself by diving; and in such cases will remain under the water for a very long time, and when coming to the surface will be far away from your boat, and that frequently in the rear, having passed under you; so that it requires a skilled boatman, as well as very watchful hunter, to capture a duck even when winged.

In this case the duck apparently reasoned that the tactics adopted when pursued by a hunter in a boat would not be suitable, since in that case it might come to the surface immediately beneath the talons of its deadly foe. It further seemed to conclude that there was but one spot absolutely safe, and that was the one on the surface which it had just left, since the momentum of the eagle in his flight would not suffer him to pause at that spot, but would necessarily carry him beyond, so that if the duck should return almost immediately to that spot he might replenish his wasted breath in safety. Whether so reasoning or not, such, at all events, was the course pursued, and no sooner had the eagle darted over the spot than the duck would immediately reappear in almost the exact locality. Nor was the sagacity displayed by the eagle any the less interesting. He adopted a great variety of tactics and method, and pursued them with untiring zeal. At times he would place himself so near the surface that his great out-stretched wings would almost dip the water, and, moving slowly, noiselessly and stealthily along, precisely like a cat, would try to steal upon his prey. When he thought he had approached as near as he could in this way, he would dart like a flash, with his great claws distended ready to seize his victim. Then, again, he would place himself in the zenith of the duck and fall, rather than dart, but still with astonishing celerity. Sometimes he would fly listlessly about, as if he had given up the chase, and as much as to say he did not care much for duck anyhow. Then, suddenly from this listless mood he would bound with electric rapidity. Then he would make a succession of darts, one following the other with the greatest celerity, wheeling and bounding as if he would not allow his duckship a moment to recover breath, and so tire him out. After something over an hour of this maneuvering he seemed to tire of the contest, and perching himself upon a neighboring tree sat perfectly motionless. Supposing he had given up in despair, we resumed our sport. But scarcely had we begun, when the same "whirr" filled our ears as at the first, and the contest was renewed with ten-fold vigor. He used less strategy now, but more bull-dog pertinacity. He seemed to have determined to "fight it out on that line if it took all summer."

And now another singular fact appeared. The duck, which at the beginning appeared to have a mortal dread of his foe, gradually grew quite bold and reckless. Alas! how danger, like vice, "sees too oft," makes us lose our caution. Many a poor life and soul is lost because of this. This it was that proved the ruin of my poor duck. Instead of seeking safety early, as he had done, he grew reckless, and would wait the quite near approach of his foe before he made his plunge. At last—there always has to be an at last—he waited just a moment too long, and the sharp claws pierced his back ere he had gotten sufficiently beneath the surface, and he was borne off in triumph.

It was with a feeling of regret that we noted the issue. For although we ourselves were taking duck life without compunction, and although this one had his organ of flight broken, so that never again could he sail with companionous over forest or stream, yet we felt that such a noble struggle for life deserved a better fate than the furnishing of a breakfast, even though that breakfast was for the lordly eagle.

J. H. WALKER.

For Forest and Stream and Rod and Gun.  
ACCIPITRICE.

Quails are the natural food of hawks, and a hawk which is large enough to catch a quail will lose no opportunity to do so. For this we should not blame him. We can simply pity the unfortunate quail. But the latter is also the natural food of man, and since the hawk respects no close season he has come to be looked upon as a lawless poacher and marauder, to destroy whom at any time is to deserve well of one's country. But this is not so easy. No bird of prey in this part of the country, in the enjoyment of freedom and reasonable self-respect, will permit an armed pedestrian to cultivate a closer acquaintance than that which may be formed at the distance of one hundred and thirty-seven yards at the very least; and since that range is one to which the ordinary shot-gun does not attain, even the most careful and cautious of approaching sportsmen is tolerably certain to see the Fox-y rascal get away Scott free. There's nothing Greener "bout him. (Next.)

But there is a way to secure him, and thus preserve the lives of the survivors of those splendid coveys which afforded you such sport last November, most of whom will fall victims, one by one, to his active rapacity.

In driving along a country road at this season, one frequently sees a large hawk sitting upon a tree, either at the edge of the woods, or in the middle of a field, but often quite close to the road. Try to one he is not at all alarmed at the approach of the buggy, and "still keeps on continuing to remain staying in the same place without moving" long after it has passed. "By jingo!" you say to yourself, "if I only had my gun!" So the next time you have occasion to drive out you take it along, and maybe you don't see any hawks, but you expect every moment to do so, which mild excitement relieves the monotonous wonderfully.

The following day you forget your gun, and pass within thirty yards of three or four big fellows. But the next time, with your No. 10 by your side and half a dozen cartridges (No. 4 shot) in your pocket, you

are prepared to attack the most savage hawk that ever clawed a dog's nose. Before you have driven a mile you notice a large, dark object perched upon the dead limb of an oak tree at the very edge of the road, about 200 yards ahead. There he is, sure enough. Pop in your cartridge; click—you are loaded. Now, look out. Nearer and nearer; only fifty yards. He doesn't stir—feels lazy after his breakfast of quail, no doubt. Bring your horse to a walk. Don't shoot yet; take it easy—he won't fly. Thirty yards—twenty-five. "Whoa, Dolly." Now—bang! Down he comes, stone dead. Dolly behaved well. Started a little, skirted a good deal, pawed the ground, but didn't budge from her tracks. Get out and pat her on the neck. "Good girl." Now pick up your hawk, isn't he rouser! Four feet at least from tip to tip. What a bill he has, and such claws! Good bye to the quail he goes for. Well, throw him into the buggy and get in yourself. Off you go. Hark! What is that? A series of shrill protracted sounds, something between a whistle and a scream, comes from somewhere not far off. Can that be another hawk? Yes, there he sits on that leafless persimmon tree in the centre of a neighboring field. There was a covey of birds in that field last month, and some of them are probably about yet. Fine ones they are, too. That hawk knows it as well as you do, for he has made a square meal of one that very morning. But he is beginning to feel the want of a little exercise, or a trifle peckish again, and the scream you just heard was as much as to say that he is going on the warpath. His yellow breast shines in the sunlight, and with all his feathers ruffled up to absorb the warmth, he looks as big as an eagle. Doubtless he thinks himself secure in so commanding a position—but what is this? A horse and buggy have entered the field where the bars are down, and are coming directly toward him. He recognizes them at once. They passed him the other day when he was admiring the landscape from the top of a cedar tree at the roadside. The man in the buggy is the same who said "By jingo" as he went by—he remembers it perfectly—and is, no doubt, coming to gather persimmons. "Well, he's welcome to them, I'm sure," says he to himself, "I can't abide 'em. But I won't play dog in the manger, so I'll be off." And with a preparatory shake, to settle his plumage, he spreads his wings, glides off into the air, and—bang!—to his astonishment, he comes to the ground the most badly demoralized specimen of ornithology this side of Plevna. A-ha! that was a good shot—forty yards if an inch. Get out—Dolly will stand—and go up to him. As you approach he raises himself on his legs and tail outspread, and with open beak and crest erected, is ready to give battle on the spot. "What a *spud-LENDID* eye!" he has (as J. Steele Mackaye once said of an owl I had shot), and yet how wicked and defiant as thus he stands upon the defensive. In spite of a broken wing there is plenty of fight in him yet. Involuntarily, you feel a sort of pity for him—a pity born of the pinch he shows—and you half wish that you had either killed him outright or missed him altogether. But, as you advance your foot to turn him over on his breast, he wheels savagely, and, as quick as lightning, strikes his needle-pointed talons through your boot. Away goes your sympathy; and stepping back a few yards—or, rather, limping back—you convert that hawk into a first-class lead mine with the utmost promptness and satisfaction. JK.

### THE TRUE BRANT IN KANSAS.

NEOSHO FALLS, KANSAS, Dec. 5, 1877.

EDITOR FOREST AND STREAM:

Referring to Mr. Greene Smith's article in your paper of the 15th ult., under the heading "Brant," and to your request thereunder, I take pleasure in informing Mr. Smith that he will find the true brant, *Branta bernicla*, in the collection of the State Board of Agriculture at the capitol, Topeka, Kansas, in charge of its secretary, Hon. Alfred C. Gray. The bird was skinned and mounted by O. S. George, Esq., who, last month wrote me (from San Jose, Cal., where he now resides) that the brant was killed in February, 1873, at Topeka, by C. Armstrong, on the Kansas River, just below the A. T. and S. F. R. R. bridge.

I also take the liberty to copy from letter of January 26 last, from Prof. F. H. Snow, State University, Lawrence, Kansas, viz.: "In regard to the brant goose: While duck shooting in the late fall of 1867, about four miles south of Lawrence, my companion (a friend from the East) amused me by raising his gun and firing at a large flock of geese lying at a great height. I should not have thought of shooting at such long-range, but I was astonished to see one of the birds drop dead at his feet. This I identified as the brant goose, *Branta bernicla*. Its occurrence may of course have been exceptional, and I should be glad to see other captures made." I feel confident from their peculiar flight (that is, occasionally bunching up) that I have seen a few flocks, but were flying so high I am not positive. I have also been told by several sportsmen, "old bay shooters," that they have seen and shot them here, which I am inclined to believe. Still, as the Snow, Hutchins and white-fronted geese are all known as brant, I would not give or take such evidence as conclusive. If the statements of Dr. Cones and Prof. Snow fail to convince Mr. Smith that the *Branta bernicla* do occasionally come inland, I would respectfully suggest that he write Mr. Gray, who will, I think, take pleasure in sending him the bird. N. S. Goss.

**RUFFED GROUSE'S DRUMMING.**—A correspondent writes from Nottingham, N. H., concerning the drumming of the ruffed grouse: "I have killed a great many while in the act of drumming. They seem to stretch themselves up as high as possible, bringing their wings full forward and not apparently against their side. I do not think it is a love note, for they drum after they have paired off, and while the mate is laying and hatching. I have frequently seen the king partridge spoken of by your correspondent. I have frequently seen them strutting in the same way and thought no more of it than to see a cock turkey do the same."

**THE SEXES OF WHITEFISH.**—A point to which Fred Mather, Esq., recently called our attention respecting certain characteristic marks on whitefish, last week evolved from Prof. Milner, of the Smithsonian Institution, some positive and desired information. The pursuit of the subject has now brought to light a fact, undoubtedly not generally known, that these self-same characteristics, or the lack of them, indicate the sexes in the fish. We quote the following letters as authority on this point:

KELLEY'S ISLAND, Ohio, Dec. 31, 1877.

MR. EDITOR.—In your issue of the 13th, Mr. F. Mather asks if an elevation of the centre of each scale, making a ridge on the lateral line of the scales, of the males of the whitefish (*C. alba*) has been observed in this country. It has, and for years, and here (the centre of the whitefish trade) it is the sign by which the fish have been selected by buyers. Females have slight ridges, males much greater. It is more noticeable by feeling than by sight. Yours, CHAS. CARPENTER.

WINNIPEG, Manitoba, Dec. 25, 1877.

EDITOR FOREST AND STREAM:

I observed a note from Mr. Mather, in your issue of the 13th inst., regarding a peculiarity in the scales of the Prussian whitefish during

the spawning season. Having observed a singular phenomenon on the whitefish taken from the large lakes in this Northwest country, it may be interesting to you to learn that here also in the fall, during the spawning season only, is that remarkable rising of the centre of each scale observable. I do not remember now whether both sexes are affected in a like manner. I cannot be mistaken, as I am familiar both with the appearance and flavor of this delicious fish, having netted numbers of whitefish the whole year round. Here the whitefish is an important item of food to the hunter and trader, and many of our native settlers can be seen encamped on the lake shores about the time of the full moon in October catching this fish, and it is no rare feat for one family, working five or six gill nets, to "spear" (i. e., to hang from the tail on a stage) two thousand fine whitefish.

In haste, yours truly,

CLEMENTI SMITH.

To "ELK."—Our attention has been called by a correspondent to an article which recently appeared in these columns entitled "Moose Hunting in Nova Scotia," in which the writer speaks of having killed a moose which was "a nearly pure-bred elk." No little confusion has arisen, both in the books and among sportsmen, from the fact that the elk of Europe, *Alces alces*, is the moose of America, while the elk of this country, *Cervus canadensis*, is a totally different animal, closely related to the red deer of Europe. It is therefore often difficult to know of what species writers are speaking when they give only the English names of their game. In this case, however, our correspondent has spoken of moose, and then almost immediately speaks of a "nearly pure-bred elk."

The American elk or wapiti is not found in Nova Scotia, and if it were we should never see a hybrid between it and the moose. Such a *melange* is quite unheard of, although in the mountains of the Northwest elk and moose are often found occupying the same range.

Will "Elk" help us on this question by explaining what he means by "a nearly pure-bred elk."

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

### HOUSE PLANTS.

IN the houses of the poor as well as in the parlors of the rich do we see the love of these bright gifts of nature manifest itself—often in the former case the only indication of any appreciation of the beautiful. There are few indeed who do not love plants in their homes, and many more would have them were they not deterred from doing so, either by their fear of being unsuccessful or by their lack of success in the past. Many writers also on this subject begin by informing their readers that no person need attempt a window garden, except it be ivy and ferns, unless they can have them in the full sunshine, and likewise that the heated air from a furnace, and more especially the burning of gas in the room, is death to the plants. Doubtless they require as pure an air as possible, and while admitting that foul air, etc., is injurious, probably the most fruitful cause of ill health in house plants is *dust*. A plant breathes through myriads of pores existing more or less numerously in the foliage, according to the species. The fine dust always floating in the air of living rooms settles upon the plants, and just so much as the pores become clogged, so much is the health of the plant affected by the stoppage of one of its vital functions. Sponging with lukewarm water, or removing the plant to a sink or bath tub and showering the whole plant liberally with a sprinkler, is an easy remedy, and the increased healthiness of the plant will soon show its appreciation of the generous treatment. Another fruitful cause of disappointment is the vitiated air of our living rooms, more especially where the life of the air is dried out of it by the red hot iron of our furnaces or stoves. From such modes of heating houses gases escape more or less contaminating the air. Where gas also is used a large percentage escapes unconsumed into the air of the room. Evaporation of water in stoves and furnaces is of great benefit and should be universally adopted, and the temperature of the room allowed to fall at night to from 40 to 45 deg. F. if possible. For the generality of plants plenty of light is necessary—sun-light if possible—and the more direct the light the better; still numbers of plants, such as Palms, Ferns, etc., can be grown in a northern exposure, and do better than if in a sunny window, care being taken to place them as close to the glass as possible, and to turn them frequently so that all sides may have equal exposure. As for soil, for most plants a rich, light soil is suitable which can be made up of the top spot from an old pasture; or, still better, the sods from the road-side with a liberal admixture of wood-mold, rotted manure and good sharp sand placed in a heap, thoroughly rotted and incorporated by being turned over and mixed up a few times. Any good, sweet earth—not sodden or sour—will grow common plants well, but it is better to have some really good soil on hand, or it can be had from any florist when required. If any plant requires extra feeding—and many to ward spring will be found to do so—weak liquid manure made of guano, salts of ammonia or cow manure and soot, may be given once or twice a week, to the great benefit of the plants. Provision should also be made by ample drainage for the escape of all superfluous water, and where saucers are used all water which drains off should be emptied. Watering should always be thorough. More plants get unhealthy by being watered in little dribbles than by any other way. Give a good soaking, thoroughly wetting all the soil until the water runs off, and then do not water until the plant is dry. As

previously mentioned, cleanliness is of the first importance. Sponging with lukewarm water, or showering the whole plant copiously, will do much to keep the plants in good condition, the frequency of which will, of course, depend upon the necessities of the case or the nature of the plant. Insect enemies are numerous, though easily kept in subjection by constant watchfulness. The aphid, or green fly, and the brown and black thrip can be destroyed by tobacco smoke; but the best and most simple method of keeping house plants clear of all manner of insect life—rod spider and mealy bug included—is to dip them occasionally in water at a temperature of 180 deg. to 140 deg. F. This not only cleans the whole plant thoroughly from dust, but, without hurting it in the least, kills all insect life—eggs and all—on it. Next week we will enumerate a few of the plants we have found most suited for house culture.

## For Forest and Stream and Rod and Gun. ORIGIN OF THE VARIOUS CLASSES OF STRAWBERRIES.

[Concluded.]

**FRAGARIA GRANDIFLORA.**—This is indigenous in S. America, and consequently, on the Atlantic tropical side of S. America. It has often been confounded with the preceding species *Chiloensis*, but the distinctive characteristics of smaller, narrower, more elongated and delicate leaves, upright habit of growth, tender constitution, and the richly concentrated pine-apple flavor of the fruit, which is conical, and has a decided neck above the calyx, are sufficient to distinguish it as a different species. From its sensitiveness to our extreme frosts in winter and droughts in the heat of midsummer the varieties are difficult of cultivation with us, but are successfully grown in the mild and damp climate of Britain. Even there, however, a moist and protected situation has to be chosen to accomplish real success. This species has furnished the varieties known as the Pine Apple Class, which are quite distinct from what are called Pines by some British authors. It has not entered largely in the mixture with the other classes, the object being the obtaining of fine large fruit with hardy and vigorous growth and free bearing habits, and, as the *Chiloensis* has these good properties it has been accepted and formed more of the base in the march of improvement. It is probable, however, that a class of strawberries of very exquisite flavor, and comparatively hardy withal, might be obtained in a few generations by impregnating some of our most robust and hardy varieties with one of the best of this class. In connection with this, and in proof of the supposition, allow me to relate an example which came under my own practice some twenty-eight years ago. I had at that time what was known as Burr's New Pine and the Iowa Seedling planted along side each other. Let it be understood that the Pine is a delicate grower and the Iowa vigorous and hardy. Knowing from former experience that, if a robust constitution is required in the offspring, when artificial fertilization is practiced, the good grower ought to be the mother plant, and that the flowers and fruit are more likely to resemble the father, I dusted, from time to time, the pollen of the Pine over the flowers of the Iowa. The after result was, a number of the seedlings bore evident proof of the success of the operation, but only one was of superior merit, and this variety is in being at the present day as healthy and vigorous as ever. The plant is very hardy and a most constant and abundant bearer; fruit large, globular, with a decided neck above the calyx, which is one of the distinguishing features of the Pine; peduncles long and stout supporting the fruit well above the foliage. The flavor partakes of the Pine sufficiently to make it spicy and sprightly in connection with the sub-acid of the Iowa, and the aroma is strong enough to scent a room when a dish of the berries is introduced. It is, however, too soft and light colored as a market berry and only good for private cultivation.

**FRAGARIA ELATIOR.**—Exclusively a native of Northern Europe, and the species that has furnished the class known as *Hautbois*, of which there are some half dozen kinds, each having, perhaps, as many synonyms. The distinguishing characters of this class, and the only ones which recommend it for cultivation, are hardness and the peculiar musky, sweet flavor which more or less pervades all the varieties. Fine gone by the *Hautbois* were very much grown, but they are now superseded by the large and fine kinds. There is a tendency in the flowers of this class to become diocious—that is, to bear male flowers on one plant and female on another, consequently it is necessary, to be sure of a perfect crop, to have a few of the male plants distributed among the fertile ones; but care must be taken that the former do not gain the ascendancy, as they are more luxuriant and produce runners in greater abundance than the latter. By paying attention to these points the *Hautbois* are abundant bearers and will give satisfaction to those who may relish a flavor akin to sugar in combination with musk.

If there was formerly any mixture of this with the other classes of by-gone times it is pretty much obliterated in the present, although, very likely, there may be a slight taint in solitary cases, as the *Hautbois* used to be more generally cultivated. The Hovey's Seedling, a decided female of American origin, and Cuthill's Black Prince, an English kind, for instance, may have been so constituted, for they have, to some extent, the appearance in growth and fruit to this class; and it is probable that this intermixture was the cause of said kind showing a tendency toward the uneven balance between stamens and pistils, more particularly so as the *Hautbois*, being more generally grown, the admixture may have happened without human aid or the knowledge of the cultivator, simply by the aid of insects and the readiness with which cross fertilization takes place. Some persons will remember the disputes which used to occur respecting male and female strawberries, and what prejudiced and angry discussions were indulged in without the combatants on either side going down to bottom facts and taking all the circumstances into consideration. We all know that hereditary taint may lie dormant through many generations, may never develop its entirety under the conditions which existed from its embryo stage, but if said circumstances be changed said taint may display itself, and without a proper allowance being given and the physiological bearing being understood, the most erroneous conclusions may be arrived at. In our present instance we have some proof of this argument in the case of Cuthill's Black Prince mentioned above. This variety bears unmistakable resemblance tending toward the *Hautbois*, and although the color is considerably darker than the latter the former has partially the flavor of *Hautbois*, and hence the peculiarity which recommended it in its day. Another

singular coincidence connected with this variety is its tendency to produce a second light crop of fruit. The same is the case with the kind known as *Proflig* *Hautbois*, also what is still more interesting, the Black Prince, in the damper and milder climate of Britain, is hermaphrodite, while here, so far as my experience goes, it is frequently female with abortive stamens, and requires the aid of pollen from another variety to fertilize its incipient fruit. This difference may be accounted for by the above explanation, viz., that the taint of the *Hautbois* has lain dormant, so far as the reproductive organs have been under original influences, but the difference of climate, etc., has eliminated and brought out these latent properties in an abnormal degree. I do not know the history of the recently introduced variety, Black Defiance, but suspect that some taint of this constitutional peculiarity is inherited by it. I only surmise this, however, from its tendency toward the qualities here spoken of.

**FRAGARIA COLLINA.**—This species is a native of the mountains of Europe, and constitutes what is known as the *Alpine Class*. The habit of plant is dwarf, approaching to prostrate, producing an abundance of runners; leaflets small, oval, sharply serrate; fruit small, conical, bright red or amber white in the several varieties; seeds very prominent; flavor sub-acid, somewhat tame. *Fragaria collina* retains its normal characters under cultivation, and is less prone to run into varieties than any other one of the genus—so much so that we have no reliable evidence of its having influenced any of the almost endless variety produced from other sources. Even within its own sphere there are only some four, or perhaps five, distinct kinds, although any amount of synonyms with "high fallutin" names are reckoned on, particularly so amongst the cultivators on the continent of Europe. These varieties are the *Red* and *White Alpine*, known in France as *Des Alpes de Quatre Saisons* a fruit rouge, and *Des Alpes de Quatre Saisons* a fruit blanc, and the *Red* and *White Bush Alpine*, the two latter having the peculiar property of never producing any runners, but in every other respect identical with the first mentioned. This, however, is sufficient to constitute them as distinct varieties of the same species, and so we have them. A peculiarity of this species is its long continued blossoming and bearing of fruit, the which lasts from June to November in our latitude, hence the French epithet *Quatre Saisons*, or four seasons. It is on account of this quality that any of the varieties are worthy of cultivation, but it is sufficient to give them a place in any collection where a continuation of the strawberry season is desired.

A class of everbearing strawberries has long been a desideratum. We have repeatedly had it heralded that such an acquisition had been obtained, but, so far, the pretension has only ended in disappointment and proved to be nothing more than one of the varieties of this species which some ignorant enthusiast, or, worse still, some contemptible rogue, has tried to foist upon the credulous public. It is possible, however, that this desirable goal may be arrived at, notwithstanding the fixedness of character here inherited, if some intelligent and persistent operator would, through a series of generations, persevere in fertilizing this class with some good variety which has a tendency to more than usual long continued bearing, or, at times, shows a disposition to produce, in a natural way, a light second crop. I would here hint the black defiance would be a very likely one to practice with, as it is occasionally inclined in this manner. If this could be accomplished the quality of the insipid alpine would be improved and the long continued bearing probably retained. Without the assistance of another kind the alpine may be improved by sowing, from year to year, seeds of the berries, the which, however, will retain the character of the parent.

If we examine into the fixedness of organism as found in this species it appears very singular compared with the readiness of the others to fertilize with each other; but when we come to search closely into all the details and mode of growth, it will be seen that although this is what may be called a true strawberry there is nevertheless in its approach toward an allied genus of fixed character, viz.: *Potentilla*, and, consequently, *Fragaria collina* in connection with *F. indica* and *Dolibaarda fragarioides* (Mich.), both of which produce dry and hard fruit, may be considered as one of the almost imperceptible links in creation which are universal.

A recapitulation of the above arguments will stand thus: The so named *Scarlet Class* has originated from *Fragaria virginiana* directly; excepting in a few varieties, perhaps, there may be a slight taint of *F. vesca*.

The most popular and best quality of Europe, known as *Chills*, *Pines* or *Carolinians* have proceeded mainly from *Fragaria chiloensis* with some mixture of *F. vesca* and, possibly, a trifle, in a few of the varieties of *F. elatior* and *F. grandiflora*. Our American large, fine, and now excellent *Price Class* has been produced from the sub-species *Fragaria tovarensis* in connection with the European kinds, and consequently in this indirect way the varieties contain a portion of *F. chiloensis* in their structure.

The highly scented *Pine Apple class* is direct, or nearly so, from the Surinam species, *Fragaria grandiflora*. The *Hautbois Class* is direct from *Fragaria elatior*, and the *Alpine Class* absolutely from *Fragaria collina*.

In presenting these few remarks I do not wish it to be understood that every detail can be vouched for in its entirety, but, from long experience and much investigation, I am convinced that further search and inquiry by more competent authors will find the facts to agree in the aggregate with this record.

West New Brighton, Staten Island. WM. CHORLTON.

**PIGEON SHOW.**—The National Columbarian Society opens its third annual exhibition of fancy pigeons on the 16th inst. at the Aquarium. Extensive preparations have been made to insure the success of the show, and there is every indication that it will embrace a more valuable and extensive collection than ever before. The society have offered a liberal list of premiums, to which is added a special list by Messrs. Reiche & Brother, the proprietors of the Aquarium, amounting to \$2,000. There are to be sixteen classes—Pouters, carriers, barbs, short-faced tumblers, owls, trumpeters, fan-tails, turkeys, Jacobins, priests, swallows, nuns and Antwerps. Entries may be addressed to the Secretary of the Columbarian Society, Mr. L. O. Thurston, Sing Sing, N. Y., or Mr. Lewis Burlingame, Cortlandt street, this city, and will close on the 11th inst.

ST. JOHN, N. B., RISING FROM ITS ASHES.—A friend writing from St. John, New Brunswick, says: "This city is being rebuilt, marvelously, and brick and graystone will mainly, in the business part of the city, take the place of wood. The

means have come from three sources: 1. Latent or reserved capital of owners or else capital formerly employed in marine risks lying idle in the recent depression in trade. 2. From paid-up fire insurance. 3. From foreign sources on bonds and mortgages. The large number of carpenters, hardstone masons, bricklayers, etc., have come from Canada, Nova Scotia, in part, but mainly are skilled workmen from Boston, Portland and New York. Activity is everywhere manifested, while the mild weather and entire absence of snow is enabling the work of renovating St. John to make a great show. Whole streets are rebuilt with entire brick warehouses four or five stories high, the result of the energy in their own cause of the business men; but the public buildings, which must be the work of the Dominion of Canada, have not yet been commenced.

"Hey! Shine!" demanded an urchin of an astute stranger who was passing, and he thrust out his box and brush menacingly. "Hay! Shine!" mentally responded the philosopher, in a sort of half soliloquy. "Yes, that's it, my lad. Hay—shine. Make hay while the sun shines. That's right, sonny, you'll do," and he sauntered on, meditating upon the wisdom of the street boys of New York.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age.
2. Food and medicine given.
3. Appearance of the eye; of the coat; of the tongue and lips.
4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc.
5. Breathing, the number of respirations per minute, and whether labored or not.
6. Condition of the bowels and secretions of the kidneys, color, etc.
7. Appetite; regular, variable, etc.
8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg.
9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed signs of suffering, etc.

## FOX-HUNTING IN NORTH CAROLINA.

THE Roanoke is now falling. Its waters, however, still cover the greater part of the low grounds. The destruction is immense. Not a fodder, oat or hay-stack left! Unfortunately I had gathered no corn, and cannot say what loss I have sustained. I fear dogs and teams will feel it and proclaim it the ensuing year by their lean and hungry looks. But I must make the most of it; repining is no remedy, and it is the philosophy of my teaching to be merry in adversity.

On Wednesday (Nov. 14) I carried my pack to Brodnax's that, on the following morning, we might have an equal and an early start. I rode a thoroughbred gelding, out of Sileck by Stevens, and directed my servant to stand on an eminence near Gaston with Lord Elgin as a relief. Brodnax was equally well prepared. He rode a thoroughbred mare, by Taxahin, and held a well-bred gelding in reserve. The catching of the old red was no trilling affair. He had too often baffled us singly and united for us to underrate his powers, and we had determined that this day should be honestly dedicated to him. We were awake long before the thrice crowing of the cock, and at day our breakfast had been made, horses saddled and dogs fed. Thus early we set out and rode rapidly to Giber's Hill, the usual haunt of the old vixen. Leaning too near to the low-grounds we ran into a number of coons just as Brodnax's *Rekout* gave mouth half up the hill. Brodnax hurried to the coon fight and I to *Rekout*, with a goodly number of the pack. The fox was up and away. He flew down the Roanoke with a speed defying his pursuers. I followed close upon the pack, keeping above the line of their run and north of it. The fox kept down the Roanoke for some nine miles, and then abruptly turned back, making the same run up as down the Roanoke. As soon as the sound of the pack indicated the turn of the fox up stream, I halted near his going down track with the "peerless Vanity" and Aggy, by some accident thrown out, to ride the leading dogs. The sound approached nearer and nearer. I was just rightly posted to see both fox and dogs. In an instant a negro hollows: "Here goes the fox right to you." The pack was right upon him. I apprehended confusion from Vanity and Aggy. I hurried them to the pack with much earnestness and approached diagonally the fox's run so as to secure a united pack. All went well. Vanity and Aggy took the back end and ran it to the pack, then just emerging from the head of a thick branch by which a plantation road passed. This road the fox had jumped into ahead of the negro and ran up, and it was the same I induced Vanity and Aggy to run back into the pack some hundred yards. But Vanity had scarcely met the pack before she discovered her mistake, and whirled back instantaneously, and almost flew. Six of Brodnax's dogs jumped into the road from the branch nearly simultaneously, his *Rekout*, according to the calculation or the moment, certainly four feet in advance. I had only one with his six—Redbird, a yearling puppy. Vanity and Aggy had corrected their mistake, which put them in advance some ten paces only. I looked to my right and the great body of the pack had crossed the road at the head of the thick branch and were breasting the leading dogs, and in a style wise and artistic. But, unfortunately for them, the fox turned abruptly to the river, down a deep ravine, throwing most of them clear out, and the wind being adverse, myself out of hearing. But I knew my duty, and pushed forward with increased speed. Seeing a negro I inquired if he saw the fox and hounds. "Yes, yes, Mars'r Tom. They were certainly chatting to that fox." "Did the fox understand their language?" "Bless your soul, Mars'r Tom, he surely did. He ran right up to me and didn't even look at me. He was in too big a hurry." "What colored dog came ahead?" "Nar one was head; all was dare, seemed to me, at once." I then put spurs again and soon regained lost time

and ground. This part of the run was witnessed only by myself. The other huntsmen had halted to do the riding at the upper end. I, however, overlooked most of them and pressed for Lord Elgin, then in waiting for the upper race. I had, however, barely saddled him before Brodnax's horn admonished us that the race was over, and the old red fox had at last been caught, and that, too, in only one hour, and forty minutes. One of our party was stationed at Vincent's Hill. I heard him give a tremendous cheer as the pack passed him. There Gen. Starke's Dolly was ahead, and kept it entirely across a stubble-field. Brodnax was still at Giber's Hill awaiting the return run. He took position to see the leaders. My Rodman was there ahead, running like a scared cur, and taking up the mill road, wrongfully drew off every dog, except Vanity and Dolly, both too self-reliant to be diverted from their course, crossed the road as the fox had done. The pack, however, swung around to their enchanting notes—treble and bass—and rather gained ground than lost. No one ever headed the pack after this or even saw the first dogs, as all was over before time and occasion allowed it. We all soon assembled to talk over the race, which of course was done in jolly huntmen's style. A little negro boy seated on the top rail of a fence near by us, with mouth open and eyes wider, hallooed out as Brodnax pitched the fox down: "Dar now, dey done caught the old red." He was an old red in all truth. We did not weigh him, but his height was that of an average hound, say two feet, his teeth much worn, head quite grey, tail perfect with a very large white end, legs black, hind feet white to near the hock, belly blue as indigo and back red as ever red fox's was before. I cut off and expressed to Col. Skinner, at the FOREST AND STREAM office, the right hind foot, which I hope he received.

T. G. T.

## STUDY DOGS' CHARACTERS.

ALGONA, Kossuth Co., Iowa, Dec. 28, 1877.

EDITOR FOREST AND STREAM:—For twenty-five years I have been very much interested in the breeding and training of pointer and setter dogs, and have arrived at the conclusion that most men who breed and train hunting dogs do not make the business successful from the fact that they do not study their dogs. They do not understand them. One man may have good stock and yet not breed good dogs for work, while another may have but a common, or even quite poor stock and yet he will raise fair dogs for the field. One understands his business the other does not. In order to breed good hunting dogs too much care cannot be taken in the selection of the slut and dog. I would never breed from a slut, or never use a dog that is, or ever was, in the least gun-shy. My breeders must love the gun. When they are young I want it to be natural for them to like the sound of a gun, and not have to train them to it. Both slut and dog must be good field workers. They must be good rangiers; staunch when they find the game, and not continually making "false points." I dislike a dog that is always pointing without any game, and would not breed from one that was not sure in her points. Both slut and dog must be good retrievers, able to fetch a goose or duck out of the worst sloughs and always ready to go through ice and snow after wounded or dead game. I would have the weight of the slut between fifty and sixty pounds, weight of the dog over sixty pounds if possible. They must be good natured, not inclined to fight, yet able to protect themselves. I do not think it makes any difference about the color of your dogs. That may be left to a man's fancy. I prefer dark red dogs, as I hunt in an open country and shoot a great many wild geese and ducks. It is hard to keep a white, or light colored dog from being seen by the game.

Now, in regard to the breeding. You have a good slut and dog. When the slut is ready to take the dog take them both out where there is game. Hunt the slut till you find game; that is if it does not take over one half hour. Be sure and find game within that time if possible, so as not to tire the slut. Then take your slut in and hunt the dog the same length of time that you did the slut. After that the dog should go to the slut at once. From that time till the slut has pups hunt her a little every day, but not more than ten minutes a day the last week before the pups come. Have her retrieve the birds shot over her in good shape. The last time my slut was with pups I shot a quail over her the day before they came. Every one of those pups would stand and retrieve at two months of age, and were as fond of a gun as most old dogs.

Now, about the training for the field. All I do the first year is to house-break and teach them to carry and retrieve. Be careful that a young pup does not mouth or mangle anything that he is retrieving. I use a newspaper first, and after he carries that well take a dry wing. When I am training a dog I never speak unless I want the dog to do something. Continually talking to a dog will make a fool of him. He will not know what you want him to do. When the pup is a year old I take him into the field with my old dog (a great ranger and a very staunch dog). When the old dog comes to make a motion for him to down, when I have the young dog come up and make his point. I do not allow him to start the bird, but start him myself, and am careful that the dog does not start at the same time. Make him stand still. Do not shoot the bird, but allow it to go away. I go through with the same work three or four days till the young dog is very staunch and will stand on any game birds. After that I am ready to kill a bird over the pup. Be sure and kill the bird dead. Then let the pup retrieve it. After that I have no trouble; my pup is ready for work. I always allow my dogs to range just as far as they will go. I think prairie chickens are the best birds to train dogs on. A man can always see his dog and know what he is doing. My old dogs will stand just as well five hundred feet away as within twenty, and if the bird starts will drop and remain there till I make a motion for them to go on.

J. G. SMITH.

## PRIZES AT THE ST. LOUIS BENCH SHOW.

DIVISION 3—SPECIAL PRIZES.

|  |  |       |
|--|--|-------|
| Class  | —Best brace of native setters of any strain, to be owned by exhibitor, a fine double breech-loading gun, donated by Nichols & Lefever.   | \$200 |
| Class  | —Best brace of English setters, imported or native, owned by exhibitor, a fine double breech-loading gun, donated by Parker Bros.  | 175   |
| Class  | —Best brace of Irish setters, imported or native, owned by exhibitor, a fine double breech-loading gun (Greener's make), donated by Simmons Hardware Co., of St. Louis.                        | 100   |
| Class  | —Best brace of Gordon or black and tan setters, imported or native, owned by exhibitor, fine double breech-loading gun, donated by Remington Arms Co., through Brown & Hilder, St. Louis Agts. | 100   |
| Class  | —Best brace of pointers, any size, imported or native, owned by exhibitor, a handsome oil painting, game piece, painted and presented by the St. Louis artist, Miss Josie McKellops.           | 150   |
| For the second best brace of pointers, any size, imported or native, owned by exhibitor, a fine quality velvet or corduroy shooting suit, to order of the winner, made and donated by John V. Metlar, St. Louis. |  |       |
| Class  | —Best pointer dog or bitch, any size, imported or native, a rich silver tea service, donated by F. A. Durgin, St. Louis.   | 75    |

- Class —Best pointer dog, any size, imported or native, for stud purposes, to be shown with two of his get, handsome silver plate, donated by H. Mead & Co., Jewelers, St. Louis.
- Class —Best pointer bitch, any size, imported or native, to be shown with two of her progeny, a fine oil painting, sporting scene, painted for the purpose, donated by George J. Mack, St. Louis.
- Class —Best native English setter dog, a handsome silver cup, donated by F. O. de Luz, agent for Spratt's Patent, London.
- Class —Best English setter dog, imported or native, for stud purposes, to be shown with two of his get, handsome silver plate, donated by L. Bauman & Co., Jewelers, St. Louis.
- Class —Best English setter bitch, imported or native, to be shown with two of her progeny, two prizes, viz., 2,000 paper shells, presented by St. Louis Patent Shell Co., value \$20, and one case fine powder, presented by Laffin & Rand Powder Co., value, \$20, total value.
- Class —Best Irish setter dog, imported or native, for stud purposes, to be shown with two of his get, handsome silver wine stand with three decanters, donated by J. P. Capelle, Jeweler, St. Louis.
- Class —Best Irish setter bitch, imported or native, to be shown with two of her progeny, a handsome English gun case, presented by H. Folsom & Co., St. Louis.
- Class —Best Irish setter dog or bitch, imported or native, special—not yet named.
- Class —Best English setter dog or bitch, imported or native, a fine gold watch, presented by Mornod Jacob & Co., Jewelers, St. Louis.
- Class —Best Gordon or black and tan setter dog, imported or native, for stud purposes, to be shown with two of his get, a handsome silver wine stand, presented by a member of the association.
- Class —Best Gordon or black and tan setter bitch, imported or native, to be shown with two of her progeny, a set of sporting wares, presented by St. Louis Book & News Co.
- Class —Best native Irish setter dog or bitch, a handsome silver cup, presented by a member of the association.
- Class —Best native setter pup, dog or bitch, of any strain, under one year old, a fine shooting suit, presented by W. H. Holabird, Sportsman's Clothier.
- Class —Best Irish water spaniel, dog or bitch, fine silver cup, presented by a member of the association.
- Class —Best Irish water spaniel, dog or bitch, the get of Sinbad or King of the Rivers, a fine silver cup, presented by J. H. Whitman, Chicago.
- For the second best, as above, another cup, same donor.
- Class —(Mr. Whitman's dogs not to compete in this class.)
- Class —Best Chesapeake bay dog or bitch, short or long-haired, a complete rubber suit, presented by Geo. B. Thomson, agent Goodyear Rubber Co.
- Class —Best Beagle dog or bitch, a fine silver cup, given by a member of the association.
- Class —Best couple of foxhounds, a set of Frank Forrester's works, given by the Gray & Baker Book and Stationery Co., St. Louis.
- Class —Best fox terrier, dog or bitch, Havana cigars, given by Girard & Stinger, Cigar Dealers, St. Louis.
- Class —Best black and tan terrier, dog or bitch, large size, a fine silk umbrella, donated by John W. Loader, Hatter, St. Louis.
- Class —Best black and tan terrier, dog or bitch, small size, one dozen fine white shirts made to order of winner, donated by Geo. T. Fowler, dealer in Gents' Furnishing Goods, Fort Wayne, Ind.
- Class —Best Yorkshire terrier, dog or bitch, a fine silk hat to order of winner, donated by M. J. Steinberg, Hatter, St. Louis.
- Class —Best shepherd dog or bitch, smooth or rough, special—not named.

A number of other specials are to be added to the above list.

#### DIVISION 4—SPORTSMEN'S GOODS.

- Class 1—Best breech-loading double-barreled shot-gun of any make, convenience and strength of action and general workmanship considered, a handsome gold medal of the association, suitably engraved, cash value.
- Class 2—Best gun, as above, of American make.
- Class 3—Best gun, as above, any maker, not to cost over \$250 retail, silver medal.
- Class 4—Best gun, as above, any maker, not to cost over \$150 retail, silver medal.
- Class 5—Best gun, as above, any maker, not to cost over \$100 retail, silver medal.
- Class 6—Best gun, as above, any maker, not to cost over \$50 retail, silver medal.
- Class 7—Best target rifle, as above, any maker, silver medal.
- Class 8—Best sporting rifle, as above, any maker, silver medal.
- Class 9—Best shooting suit, coat, pants, vest and hat or cap, convenience and quality of goods considered, silver medal.
- Class 10—Best shooting suit, as above, not to cost over \$25, silver medal.
- Class 11—Best hunting boat, convenience, strength and lightness considered, silver medal.
- Class 12—Best fishing boat, as above, silver medal.
- Class 13—Best Hunting boots, adapted for field use, silver medal.
- Class 14—Best display of dog tackle, silver medal.
- Class 15—Best fishing rod for general use, strength, lightness and workmanship considered, silver medal.
- Class 16—Best specimen of taxidermist's work, silver medal.
- Class 17—Best display of taxidermist's work, birds and animals, silver medal.
- All the medals provided for in Division 4 are made to the order of the Association in a very handsome style, and cost their face value, the bills for which will be shown.
- Class 13—For the best general display of fire-arms, including sportsman's goods of all kinds, a handsome gold medal, suitably engraved.

#### MR. LINCOLN AS S'UP'T. OF THE BOSTON BENCH SHOW.

DETROIT, Mich., Jan. 5, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Sir—I have received my appointment as Superintendent for Boston Bench Show, held under the auspices of the Massachusetts Kennel Club, to take place during the last ten days in March, dates not definitely fixed. Dr. Foster, the Secretary, writes me they intend giving the show upon a first-class scale. Everything will be done for the care and comfort of the dogs, and one of the most liberal prize lists ever yet given will be offered. The merchants of Boston and other sportsmen will give liberal special prizes. They hope to receive the hearty support of all true sportsmen, and assure them in return the show will be given as a genuine sportsmen's show.

Yours truly,

CHAS. LINCOLN.

[We congratulate our Boston friends in having secured Mr. Lincoln's most valuable services.—Ed.]

MASSACHUSETTS KENNEL CLUB—Boston, Jan. 7, 1878.—I understand the Bench Show of the Massachusetts Kennel Club is to be given in the building lately occupied by Jordan, Marsh & Co., for their wholesale store. Should this building be used, it will necessitate having the Exhibition on different stories. The location is admirable, being directly in the heart of the city. There is every reason to believe that we can have a grand Exhibition of Dogs. The names of the gentlemen connected with the Club will be a guarantee to sportsmen that everything will be conducted in the most honorable manner.

SNAPPERS AND GRETCHEN.—Dr. Twaddell's thoroughbred Dachshunds Schnapps and Mein Gretchen have become the property of Dr. E. L. Tweedau, of Saranac Lake. Besides prizes at other shows, these two dogs took first and second prizes at Philadelphia, against a very strong field.

—Mr. J. R. Schuyler's (Bloomsburg, Pa.) Irish red setter bitch Zoe (Plunket-Moya) whelped on the 5th inst., all dark red puppies (4 dogs and 5 bitches), sired by Dr. Jarvis' Champion Elcho.

CARRIE.—W. T. Irwin's Carrie has whelped seven—two dogs and five bitches (one bitch has since died.) They are all black and tan. Sire, Sherwood's Champion Rupert.

RUSA AND HER PROGENY.—Rusa, belonging to Mr. William Vic, of St. Louis, has a litter of ten, five dogs and bitches. Rusa's progeny is sired by the champion dog France.

WESTMINSTER KENNEL CLUB.—The office of the Westminster Kennel Club will, after this week, be at 23 West 32d st.

—Capt. Foster, of Leesburg, Virginia, has recently sold one of Kirby's puppies (a gyp) for the handsome sum of \$500.

THE CITY DOG LICENSES FOR 1877.—The annual report of the Permit Bureau for 1877 shows that 11,991 licenses to keep dogs were issued in that year. Each license at \$3 gives the city some \$33,882—that is, providing the city gets the whole of the money, which is pretty good for the dogs. As to the civic classification of the dogs who paid license, the worst possible mess has been made of it. What may be a box-dog, a beehill dog, a duff dog, a gallup dog and a Laverack?

DETROIT DOG SHOW.—This proposed exhibition is indefinitely postponed.

GYPSIE.—J. McWhorter (Canton, Mo.) has sold to W. T. Irwin, Topeka, Kansas, his black and tan Gordon bitch Gypsie. She was bred by Dr. Vandersmith, of Lancaster, Pa., out of Jennie by Tom. They are from Mr. Tilley's stock and are believed to be as good Gordon stock as can be found in America. Dr. Vandersmith has a standing offer to hunt Jennie on equal against any dog in America. Gypsie is of medium size, has speed and good style. She will be two years old in February. Has had one litter of pups by Champion Rupert, which are very promising. She will be bred to Rupert again. Her brother Duke won second at last St. Louis show.

CANINE PLUCK.—In the contest between the "natives" and the "blue bloods" at the Nashville field trials, the most conspicuous of the former was "Joe, Jr.," by Jarvis "Elcho," out of Campbell's "Buck, Jr.," who won first in the champion stake, and second in the Dupont Powder Company stake. This magnificent dog was just recovering from the distemper, from the effects of which his right eye was closed, and around the eye was a raw space, as large as the palm of the hand. It is easy to conceive the exquisite tortures to which this poor dog was exposed in making his way through the dense cover in which he was hunted, but it is not so easy to conceive the wonderful pluck which enabled him to come out twice a victor under such suffering.

F. G. S.

THE ASHCROFT KENNEL CLUB.—This club, of Bridgeport, Conn., have elected the following officers for the year ensuing: B. B. Case, President; S. B. Hayes, W. A. Sharp, Vice-Presidents; S. S. Pease, Secretary; Theo. Courtright, Treasurer. B. B. Case, S. B. Hayes, S. S. Pease, Executive Committee. The object of this club is to study and improve the breed of dogs known as setters and pointers for sporting purposes, to breed, board, own, hire, sell, train and exhibit the same. The management of the club is under the control of the Executive Committee, they having power to fill all vacancies, to appoint an exhibition committee which is to have charge of all bench shows, the appointing of judges, etc. A resolution was passed requesting the Executive Committee to ascertain the practicability of holding a bench show the week succeeding the bench show of the Westminster Kennel Club, New York City.

TO CURE A DOG FROM TEARING CLOTHES.—Editor Forest and Stream and Rod and Gun.—Noticing in your issue of Dec. 6 that some one wants to know how to break a dog from tearing clothes when on a clothes' line, I will tell you the experience of a friend. This friend's dog would get at the clothes, and, as he had a great deal of affection for his dog, he concluded to get rid of actually whipping the dog. Watching the dog as he jumped at the line, he struck the dog with a good broom-brush, and hit him on the rump. The dog let the clothes alone. The next time the wash was hung out the dog acted as if he wanted to be at his old tricks. Finally he tried it again, when the brush of the broom was again used. The dog cleared out after that, and until now I am told that the dog does not fancy the looks of a broom. This friend has decided ideas against whipping a dog until he has tried other means.

A CONSTANT READER.

## Game Bag and Gun.

### GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

Bay birds" generally, including various species of plover, sand plover, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets etc., coming under the group *Limicola*, or Shore birds.

### CAPTAIN A. H. BOGARDUS' WONDERFUL FEAT.

5,000 GLASS BALLS BROKEN IN 480 MINUTES 35 SECONDS.

A most remarkable exhibition of human skill, pluck and endurance, was successfully accomplished on Thursday last at Gilmore's Garden. The programme was as follows:

"Gilmore's Garden, N. Y., Thursday, January 3, 1878.—Match \$2,500 a side; Captain A. H. Bogardus to break 5,000 glass balls in 500 consecutive minutes; the balls to be sprung from two or more traps at about 18 yards rise; to be broken in the air to count, and only one ball to be sprung at a time; Bogardus to use one gun with two sets of barrels, and to load his own gun, unless the weapon shall break or give out."

In the solution of a complex problem of this character, some of the factors are worthy of particular mention. Putting aside for the moment the well known skill of Captain Bogardus under ordinary circumstances, the ordeal this wonderful shot had to go through was immense. Suppose we analyze the exact number of movements called into play, in order that a double-barreled, breech-loading fowling-piece shall be loaded and discharged. Firstly, the barrels had to be unlocked. Two movements are necessary to insert the cartridges, one movement to close the barrel. Two movements in cocking; one to bring the gun to the shoulder. Two movements to draw the triggers, and two movements to draw out the exploded cartridges. Here are eleven positive movements. Of course there are several other major and minor physical exertions which might be cited. As a margin has to be allowed for misses of the balls and miss-fires, we may multiply 5,300 by 11, in order to get at all the movements necessary, which gives, with the changing of barrels, a result of fully 60,000 motions. Let any one repeat incessantly 60,000 movements, and some idea may be arrived at of the physical strength necessary in order to accomplish the feat. Now, when one remembers the recoil of a gun, and the impression left on the shoulder, 5,300 rounds fired by one pair of hands, each with an impact of 43 lbs. received by the body, makes, in the aggregate, an enormous strain. The movement, to overcome the recoil on the part of Captain Bogardus, is quite automatic, but to the careful observer the consciousness that he braced himself at every discharge was curiously evident, when his gun miss-fired. Then the shooter would fall forward for a second, and instantly recover himself. But though skill was of course the predominant thought on the part of the spectators, when directed towards Captain Bogardus, gunsmiths, cartridge manufacturers, and makers of special powders had great interest in the trial this match was sure to provoke. Five thousand three hundred consecutive discharges from two pairs of barrels was a heavy test. If the gun gave out the match might be lost, for a new gun might have not quite suited the shooter. The cartridges, too, might have been imperfect as to primer, or the wood powder used non-explosive, or without sufficient power. Finally, the traps employed during eight hours might not have been efficient. Suffice to say that all worked quite well. The misses on the part of the Captain were insignificant, and though the miss-fires were numerous, neither of them had any effect on the issue of the contest. As to the miss-fires, it may be positively asserted, both on the part of Captain Bogardus and from our own inspection, that the fault did not lie with the cartridges of the U. M. C. Co. The gun used by Captain Bogardus, an admirable one, having been used some fifty thousand times, the plungers had been slightly worn, and did not strike deep enough into the cartridge, as the miss-fire shells showed but slight indentations, and when the cartridges were used a second time they always exploded. Of course, though Captain Bogardus has as much practical experience in guns as any one in the world, he was for once at fault. A word in regard to the powder used. The explosive compound was the Dittmar powder. It would have been impossible to use black powder, in the close space of Gilmore's Garden, on account of the dense smoke it would have caused, and, as much as anything else, because of the heating of the barrels. As a strong and effective explosive, the crucial experiment made with it on the occasion sufficiently demonstrates the excellence of the Dittmar powder. We are positive that the headachy influence which the Dittmar powder is said to induce has no just foundation. Having been for some hours in close proximity to the shooter, we felt no inconvenience.

Now, as to the description of the Captain and his method of shooting. Capt. Bogardus is a magnificent specimen of a human being. He is some five feet eleven inches in height, and weighs 225 pounds. His frame is large and massive, and he has enormous brawn and muscle. Without any apparent rapidity of movement, never hurried, not the least mechanical in movement, his shooting has something slightly automatic about it. Watch him change a barrel which his coach has put on the table for him. In two—three—seconds the old barrel is taken out, and in three seconds more the new, clean bar-

a thread of it in the bunch as commonly sold. At each end you will see where it has been twisted around the pin, and beyond that, where the piece held in the fingers has been stripped out, which is usually flat. That there are other insects than the common silk-worm (how many I do not know) who have this lobe of fluid matter that is utilized into fishing gut I am satisfied. More than forty years ago I got a quantity of gut (how or from whom I do not remember), but it was different from any I had ever seen before or since. It was heavy and long. Some of the threads were nearly three feet, perfect in smoothness and equal in thickness, and as thick as good salmon gut. The color, however, differed from the ordinary gut, being brown-colored, as if soaked in tea, but I am satisfied it was the natural color. I still have a few threads of it in my tackle box, which have been there about forty-five years. I have just looked at them and find that the longest yet remaining is twenty-three and a half inches; a good, clear thread; one of the lightest of the lot.

"About as long ago as I can remember there was an article sold called sea-weed, which was used by fly-fishers. It was from three to four feet in length, round, smooth, and tapered from the root to the point, but was not reliable as to its strength. I have not seen any of it for nearly fifty years past. I would like to know if you or any of your angling readers have seen any such gut as I have described as to length and color, and if it is to be had in our market."

## FRESH WATER CODLINGS.

EDITOR FOREST AND STREAM:

Some information about the fish of which the enclosed is a rough outline, taken the day after it was caught, would be quite interesting to many of your readers. It is a fish that no one here has ever caught or seen before. It was brought to me to learn if I knew what it was. I could not remember of having seen any like it here during thirty-four years residence. In looking into a work on fishes published in New York, I found, I think, the identical fish, called the common freshwater barbot or eel pout. Describing the fish to my son, who resides in Minnesota, he writes me that he has caught them either in the Mississippi or Rock River, and that three were caught some time ago in Root River, in Minnesota. Are these fish common in the rivers or lakes in the East? Are they used for table? I am well acquainted with these sea species. They were known by the name of Ling, were dried like codfish, also sold fresh.

Davenport, Iowa, Dec. 26, 1877.

WM. GRAY.

[We recently saw some fine specimens of this variety of fish on the stand of Eugene Blackford, Fulton Market. They were taken in Cayuga Lake, in the State of New York, where they are abundant. Some of those which we saw measured two feet in length. They are repulsive in appearance, and are not in request as food. Their color is a greenish olive, something like that of the frog. It is the fresh-water counterpart of the salt-water codling, *phycis tenuis* of the family Gadidae.]

## TROUT FISHING AT TIM POND, ME.

MR. VERNON, Maine, Dec. 17, 1877.

EDITOR FOREST AND STREAM:

In September last our party of four started for Tim Pond from here. Our route from here lay through the towns of Vienna, Farmington, New Vineyard, New Portland and Kingfield, noted for being the home of Governor King, the first Governor of Maine.

From Kingfield we follow the west bank of the river up to Jerusalem Bridge, where we cross the Carrabasset and go up the Height of Land and down on the other side into Dead River Valley; cross the south branch of the Dead River and go up on what is called the "Ridge" to Kennedy Smith's, where we arrive at noon on the second day. The distance is sixty-one miles. From here we have a fine view of Mt. Bigelow and Abram, also of Dead River Valley.

"Uncle" Billy Stevens, now about eighty years of age, lives here near Mr. Smith's and is the first settler of the valley, moving here about sixty years ago, and made the first clearing. Flagstaff is ten miles below here on the Dead River. After dinner, our packs made up, we start for the pond, about six miles to the west of Smith's, and arrived there about 6 P. M.

We were up in the morning as soon as we could see, and down to the dam at the outlet of the pond, and in a short time we had about twenty fine trout that would average about one pound each. After breakfast we went to the other side of the outlet, and the rest of the day was spent in building a camp big enough to accommodate our party. The next morning we caught about twenty-five fine trout. They were handsome fellows, weighing from eight ounces to two pounds; it is rare that we get one above that weight. The under side of some of them is about the color of blood and others of a silver color. They both take a worm or rise for the fly in September. There is no fish in the pond except trout, and you know what you have every time. The pond covers about one and one-third square miles, and lies just at the northwest side of Kennebec Mountain and about five miles north of Kennebec Lake. There is good partridge shooting there, and the deer and moose are quite plenty. Two years ago when I was there we had quite an exciting chase after two caribou that were swimming across the pond, but they having too much the start for us got away. I think that there is no better trout fishing in the State of Maine than Tim Pond. This is my fourth trip there, and I have always found a plenty of fish. This time we were there eight days and caught about two hundred trout. The expense is very small, being less than \$10 each for the trip, and we were away from home twelve days.

Any one wishing to go there can go to Farmington by rail and take a team from there forty-six miles; or go to North Anson by rail and stage from there to Eustis, when it is five miles to Mr. Smith's who owns the only boat on the pond and who will go with you, or furnish a reliable guide at very reasonable rates. One going there must make up his mind to rough it from the time that he leaves Mr. Smith's until he gets back.

Any one wishing for further information can get it from Kennedy Smith Eustis, Me., or of the writer, M. S. PHILBRICK.

## BLACK BASS FISHING.

EDITOR FOREST AND STREAM:

Having followed this kind of fishing for nearly twenty years, I can tell how I do it.

In the first place, it is a common error to characterize all the different species of the bass as "black," or to confuse the black and the green under the same name, when they are of decidedly distinct habits, appearance and marks. The genuine black bass is known by an unmistakable mark; and that is the "red eye." His mouth is much smaller, and he is a trimmer and more symmetrical fish. While you always find the black bass on the sand bars, gravel beds and the margin of shoals, the green fish is unmistakably a grass fish, found always among the weeds and rushes and, except perhaps when in search of food, never near the sand and gravel beds. The green bass is a voracious monster,

never making "two bites of a cherry," and he goes for his bait with a rush, and swallows it without an effort. But the red eye is a dainty feeder and delicate biter, often taking hold of the tail of the minnow only, and holding it in his mouth for several minutes (that is in still fishing). In the country where the writer spends his summers and does his fishing, Southern Wisconsin, the black variety is plentiful and quite common, but not nearly so abundant as the green.

Now, as to the method: An eight-ounce rod, rather stiff, and nine feet in length; a Conroy double multiplying reel, a firm line twisted line, a No. 5 Sproat bend hook on gimp, and small yellow perch for bait (not very particular as to the size, for I often use a four-ounce fish). I reel the bait to the tip of the rod, and cast, with the right hand, all about the boat; and, with a little practice, the bait can be landed within one or two feet of any desired spot. If there is a bass within ten feet of the bait when it strikes the water, he will be on hand as soon as the bait is, and he never misses his reach. If you have no strike, you reel in for another cast, and, very frequently, a fish takes the bait on its way in. By this method you can cover a great deal more ground than by trolling or still fishing. You can reach the homes of the fish among the reeds and rushes, and it is a great deal more exciting and sportsman-like. While the green bass is not quite so gamy a fish when hooked as the black, he is still, eminently, a fighting fish; and a four or five pounder at the end of seventy-five or a hundred feet of line, will give you all the sport needed for a quarter of an hour or more.

Now, one or two hints: You cannot cast against the wind, as your line will certainly overrun, so you must make your casts with the wind or across it. The reel should be no more than a double multiplier, as with a heavy bait, the cast gives it such an impetus as to carry the line off the reel faster than it can get through the rings, and hence, with Kentucky or Meeks reels, which multiply four times, the line is seen to tangle.

I have gone through all the old methods of fishing, trolling with a spoon and live minnow, still fishing, and everything else, and I can assure you that the cast from the bow of a boat excels them all; indeed, we do not now consider him a sportsman who trolls with a spoon, but only a pot hunter.

If any of your readers desire to enjoy bass fishing in its perfection, let them come to Oconomowoc in June. Within a radius of fifteen miles there are more than forty lakes, and without any odious comparisons, it is certainly the loveliest spot on the American Continent.

Chicago, December, 1877.

GEO. A. SCHUPFELDT.

[For specific characteristics and modes of catching the several varieties of bass in North, South and West, see "Hallock's Sportsman's Gazetteer."—Ed.]

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

C. G. R., Port Royal.—See agricultural columns for answer to your query.

CORAM.—For elk skins apply to Eddy, Harvey & Cutter, 239 Madison St., Chicago.

ELK.—Where can I obtain elk skins? Ans. Write to Pember & Prouty, 128 West Broadway, New York.

W. G. S., Chatham, N. Y.—For woodcock and ruffed grouse shooting, what kind of a dog do I want? Ans. A setter.

C. J. P., Painesville, O.—See last week's issue in regard to the Woodruff Scientific Expedition. Address given therein.

FINDLEY'S LAKE.—A correspondent wishes information about this lake, which is near North East, on the Lake Shore R. R.

READER, Sharon, Pa.—Will some of your readers please inform me through your paper where the wild pigeons are?

H. E. W., Newark, N. J.—Where can I get pocket lanterns? Ans. White Manufacturing Co., Bridgeport, Conn.

SUBSCRIBER, Baltimore.—What is the best lubricator for the extractor and working parts of my gun? Ans. Eaton's Rust Preventive, or refined kerosene oil.

D. W. B., Brazil.—Where can I get King Charles spaniels? Ans. About the most difficult dog to get. Advertise in FOREST AND STREAM.

L. G. M., Brier Hill, N. Y.—Fur, Fin and Feather contains New York game laws. We can send it to you, price 50 cents. We have not published the Black Lake regulations.

A. W. B., Fort Lincoln, D. T.—It is difficult to get the rifle you want second-hand. We will put the matter before some of our dealers, and if they can find the gun you want, will address you.

A. S. C., Chicago.—Which is the better rifle, — or —? 2. What is the extreme accurate range as judges? Ans. 1. We must respectfully decline acting as judges. 2. About 500 yards.

AG. E., Belleville, Ill.—It was an unfortunate error of types. Should have been 50 to 75 dollars. To alter barrels from \$40 to \$50; extra engraving and neat finishing make up the remaining cost.

J. B. D., Brooklyn.—Please inform me where I can get a muzzle-loader altered to a breech-loader? Ans. Send it to A. G. Genev, 9 Chambers St., N. Y., or to George Hayden, 143 Fulton St.

A. M., Lake Charles, La.—Give me the name of a reliable house where I can have a shot gun and rifle rebored? Ans. Send to Fulson Bros., St. Louis. If you desire to send it to N. Y. let A. G. Genev, No. 9 Chamber St., do it.

W. L. B., Saugatuck.—I want to shoot four drachms and 1½ to 1½ ounce shot, what weight and gauge gun shall I use to make best pattern? Ans. Ten gauge, to weigh 8 pounds and upward.

C. R., Albany.—From the description you give of the dog would not think there was any Gordon in her. Her diminutive size inclines us to think there may be a mixture of spaniel. It is difficult to judge without seeing the animal.

S. S. H., New York.—Will you please inform me through the columns of your valuable paper where cattle raisers in Colorado and Nebraska winter their stock? Ans. They winter themselves on the range. They require no shelter or provided food.

D. L. V. E., Washington, N. H.—1. Of No. 1, 2 and 3 which gun for the price would you prefer? 2. Give me the name of a good house dealing in spruce gun. Ans. 1. For the price would prefer No. 1. 2. No demand or sale for it. Boys chew, now, paraffine.

J. H., Mount Royal.—What is used to prevent kerosene oil leaching through wood? Ans. Two coatings of glue are used. The method is to steam the barrel, and while warm, a pound of glue in solution is put on, and the barrel bunged; the barrel is then turned around, emptied, dried, and the process repeated.

SUBSCRIBER, N. Y.—1. Have Adam's guns a good reputation? 2. What brands of cheap powder are suitable for a breech-loader? 3. What is the price? 4. Would you advise a mixture of Dittmar's powder with ordinary black powder? Ans. 1. Good reputation. 2. Hazard's F. G. 3. Twenty-five cents a pound. 4. Would not work.

G. P., West Lebanon.—Where can I get live quail? Ans. Write to Reiche Bros., N. Y. (We may state, in reply to numerous inquiries as to birds, that it is very difficult to procure them. Orders with dealers must be placed fully six months before they can be filled. The migratory quail cannot be obtained, they are not for sale).

PITTSBURGH.—Is there quail shooting at St. Augustine, Fla.? If not how far away? Is there any shooting at that point, to be had and return the same day? Is it worth the trouble and expense to take dogs? Ans. Good quail shooting just across St. Sebastian River, a couple of miles. Yes; take your dog, or you will get no birds.

A. W. B., Fort Lincoln, D. T.—We can tell you of a rifle pretty much as you require—cal. 40, 30-inch steel barrels, set triggers, plain sights and bar locks. Price \$25, with peep and globe sights \$30. Cost originally \$40 and is now in good order. Address Mr. Henry C. Squires, No. 1 Corlandt St., New York City.

C. J. G., Tom's River.—1. Would a Chesapeake Bay dog make a good watch dog on a farm, and also be a No. 1 duck and water dog? 2. Where could I procure such a pup, and at about what price for the best breed? Ans. 1. Makes a good watch dog, and can find ducks too. 2. Hard to procure. Apply to C. H. Tilghman, Easton, Md.

EPPEGOS.—1. Where can Bogardus' rules for glass ball shooting be procured? 2. Where can I get a form of constitution and by-laws for the organization and governing of a game protective and shooting club? 3. Are the "Eagle Claw" traps reliable for catching and holding rats and larger animals? Ans. 1. Write Capt. Bogardus to our care. 2. We take pleasure in mailing you one. 3. Excellent for the purpose.

J. S. F., Philadelphia.—1. How much will it cost to change a muzzle-loader to a breech-loader? 2. Is there a London gunmaker by the name of —? 3. Can I buy the "Sportsman's Gazetteer" in Philadelphia, will you send it by mail? 4. What will a well broken water spaniel cost? Ans. 1. Could not fix a price. 2. Leading gunsmith. 3. Circular has been sent you. 4. About \$40.

YELLOW LEG, Auburn.—1. What is the cost of a passage to Para? 2. What will it cost to live there? 3. What is the duty on bird skins? 4. Give me the name of a book with list of birds of Central America? Ans. 1. \$75. 2. Haven't the least idea, never been there. 3. Twenty per cent, ad valorem. 4. There is no general list published. Special lists have been published by the Smithsonian, and in the annals of the Lyceum.

T. D., New York.—When deer are shot in the water, if in the red coat, they sink immediately; if in the blue coat, they float like cork. Now, can you explain the reasons for each peculiarity? I have always supposed that the hairs of the blue coat—nature's protection in cold weather—were filled with air, but my authority being called for I can find no printed authority. Ans. The deer is fatter when he is in the blue, and therefore floats. Your theory about the hair is correct to an appreciable extent.

C. E. C., Oil City, Pa.—On page 547, "Sportsman's Gazetteer," the author says: "We would not advise their use in the Winchester rifle"—speaking of explosive ball cartridges for large game. Can you explain why he would not use them? I have always thought that the use of explosive cartridges would make the Winchester the best gun for all game, from deer to a grizzly bear, but have never practically tried it. Ans. Explosive cartridges are not safe in the magazine of the gun.

A. S. B., Boston.—What is the "Ferguson Jar" for hatching fish eggs? What, if any, are the special publications on "Fish Culture," on trout particularly, since the book by L. Stone, Esq.? Ans. Write to T. B. Ferguson, the patentee, 193 North Charles St., Baltimore. No special publications printed except what is contained in Hallock's "Sportsman's Gazetteer" (178 pages) which relate to species, specific characteristics and habits, rather than to culture and propagation.

T. C. L., Rockingham.—My pointer mashes birds badly in retrieving. Can I remedy this, and how? Ans. First by patience. Two or three methods are employed which we indicate, but we do not recommend save in a modified way. One is to drive tacks in a corn cob, put it in a glove and throw it to the dog. If he is not careful when he retrieves the glove he is hurt. This is a bad plan, because once wounded in the mouth the dog suspects everything thrown to him to retrieve. The second method is to use a collar with points inside. This too is decidedly cruel. A thin cord with a slip knot can be used to correct a fault of this kind. Tighten it when the dog is at fault, but without choking him. We have seen dogs quite faulty in the respect you mention, with simple warnings and no violence, made so delicate in mouthing a bird, or any object, that they would fetch a lady's fan without hurting it. Use patience. See Hallock's Gazetteer.

O. G. P., Linwood.—1. To whom shall I apply for books on tobacco culture, etc.? 2. How is the climate of Yaukin Co., N. C., adapted to the raising of the Angora goat? 3. Where can I find data in regard to raising Angora goats? 4. Would the Yaukin River be adapted to the training of black bass and shad? 5. How can I get truffed and pinnated grouse to stock with? Ans. 1. We have none of the books on hand. Write to E. R. Billings, Somers, Conn., who publishes a good book. 2. Should think it very well adapted to raising the Angora goat. 3. Consult Vols. II. and III. of F. & S., and Agricultural Reports for 1874-75. Harrison Gray Otis, Washington, D. C., is the best posted man on Angora goats. 4. The Yaukin would be better adapted to black bass than shad. Full information can be found in back files of the FOREST AND STREAM, or from the Pennsylvania Fish Commissioner, H. J. Reeder, Easton, Pa. 5. Write to Reiche Bros., Chatham St., N. Y., for birds.

W. W. H., Cromwell.—1. Where can I obtain information in regard to "Evans' repeating rifle"? 2. What, if any, long-range muzzle-loaders are manufactured in the U. S.? Who are the parties to address? 3. What Spanish or French author wrote the lay, or lament, of Roncesvalles? 4. Has there been an English translation? Ans. 1. Evans' Rifle Mfg. Co., Mechanic Falls, Maine. 2. Remington & Sons, New York. Sharps, New York—see advertisements. 3. 4. The author of Roncesvalles is unknown. In the Oxford Library there is a manuscript of the Ninth Century which contains what little is known of it. The Chanson de Roland was part of the Roncesvalles. There is no English translation. French literature has, however, discussed the poem most fully. Refer to Leigh Hunt's "Stories of Italian Poets" for further information.

LARS.—1. Why does a ball from an overheated rifle barrel always rise, or shoot over? 2. Is the \$5 rifle advertised a carbine of 55 calibre, etc., etc.? Ans. 1. It must be first positively proved that a heated rifle barrel does throw its balls higher. We are by no means willing to accept that it does. Should, however, this fact be granted, there are some pretty theories, or rather suggestions, in regard to this over-shooting, which merely advance without endorsing it. It is asserted that after repeated firing, when the barrel warms, the expansion of the metal cylinder alters from the horizontal, being uplifted from the muzzle while retained mechanically at the breech. This then, it is said, makes the arm throw high. The barrel is bent downward, the muzzle being higher. 2. Not the arm you describe.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR LIFE OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

**Forest and Stream Publishing Company.**

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* \* \* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 10, 1878.

#### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

**CHARLES BALLOCK, Editor.**

Business Manager.

S. H. TURRILL, Chicago,  
Western Manager.

**BLOOMING GROVE PARK ASSOCIATION BALL.**—This event took place on Thursday night at the Hoffman House, and for brilliancy, quality, and numbers of guests present was a marked success. Composed chiefly of members and their intimate friends, it partook strictly of the character of a private social reunion, and for this reason was most enjoyable. Between 200 and 300 persons were present, and the number of ladies and gentlemen distinguished in literary and official positions was very considerable. Some of the toilets were very tasteful and elaborate. Mr. C. H. Reed, the proprietor of the Hoffman House, who is a member of the association, placed the dancing hall and several reception rooms at the disposal of the party, and furnished a most bounteous and elaborate collation, which was really perfect of its kind, doing credit to the ingenuity and good taste of the caterer. The association has reason to acknowledge its obligations to Mr. Reed. The arrangements throughout for the comfort of all concerned were most perfect.

The occasion included a reception to its first President, Fayette S. Giles, Esq., who has recently returned from a three years' absence in Switzerland. Simon Sterne, Esq., delivered an eloquent and fraternal address of welcome immediately after the supper, in which he set forth what Mr. Giles had done for the preservation of game in setting apart a natural park of 12,000 acres for its propagation and protection; in providing a delightful resort for ladies, gentlemen, and children, and in cultivating a taste for aesthetics. The event has done much to bring the association and its objects into more popular notice.

**OUR AGENT WEST OF THE ROCKY MOUNTAINS.**—Mr. B. B. Porter is our duly authorized agent west of the Rocky Mountains for the FOREST AND STREAM AND ROD AND GUN, and also for the sale of "Hallock's Sportsman's Gazetteer." Mr. Porter's address is at San Francisco. Mr. Porter is well known to many of our readers as a fish-culturist of large experience, having contributed numerous articles to this paper.

**BOGARDUS' SCORE.**—We have published an extra edition this week, and can supply copies to all persons wishing to preserve the full record of Bogardus' wonderful feat.

**A CARD TO CONTRIBUTORS.**—We have on hand an accumulation of miscellaneous sketches which give us much anxiety. Most of them are of considerable interest and literary merit, and many are from writers of prominence. Of course the authors expect their prompt publication. We are therefore persuaded to print a list of the same for the guidance of those concerned. As their average length usually precludes the possibility of our printing more than two in any given issue of our paper, it can be easily calculated how long it will take us to run through the list, supposing that it receives no increase. We will do the fair thing in our selection, and if any contributor has not patience to wait for the publication of his article, let him kindly notify us and we will return it free of cost:

Perkins Pilgrimage; From the West Eastward; The Coyote and a Chase or Two; A Christmas in Peril; Voyaging on the Upper Missouri (a series), by Ernest Ingersoll; Notes of Shooting in Virginia; Sport in Minnesota; Breches Lake; Itinerary of the Alleghenies; Bear Hunt on the Sunflower River; An Alligator Story; Spirit Lake; Squirrel Stew; Swan Shooting on the Potomac, by Page McCarthy; Richardson Lakes in Winter (three papers), by Chas. A. J. Farrar; Catching Deer in the Snow; Bears in the Great Dismal Swamp, by Ned Buntline; On Day Chaleur; Hunting Reminiscences, by F. G. Skinner; Moose Hunting in Nova Scotia (two articles); Roughing It in the Wilds of Maine (64 pages); The Tent in the North Woods, by E. H. Litchfield; A Model Camp (58 pages); Marine Monsters of Tradition and Fact, by C. F. Holder; Brown's Tract, or New York's Hunting Park; Something About Bears; Tread by a Panther; Sketches in the Choctaw Country.

**SPORTING CLUBS AND SPORTSMEN IN RUSSIA.**—We call attention to an exceedingly interesting letter from our correspondent, which gives an insight into the methods of hunting employed in the neighborhood of St. Petersburg. It seems that within a short distance of the new capital of all the Russias, game is found in abundance. Our correspondent, having participated in many hunting expeditions, relates his experiences. The capercaillie, as our readers have been informed, is a noble bird, a prize much sought after by Russian sportsmen. That ruling epidemic, "striking," seems to have even reached Russia, since our correspondent tells us that the beaters struck. Can these be Nihilists, such as Wallace talks about among the Russian Mujiks? We trust soon to publish further communications from the same correspondent.

**SHEEP RAISING IN TEXAS.**—The attention of a great many persons in the United States has been directed toward sheep-raising in Texas, New Mexico and Colorado, and in the FOREST AND STREAM AND ROD AND GUN we have published quite a number of letters from persons directly engaged in sheep culture. In the great future of this country the sections of the United States above indicated will become the wool producing districts of the world. Of course, an industry of this kind, like any other, requires thrift, economy and judgment; but for a small amount of capital, sheep-raising probably produces more rapid and certain results than almost any other enterprise. There are innumerable people in our midst, either tired of cities or whose businesses have been unfortunate, who might find a healthy life and a lucrative business in sheep-raising. Until future railroads are developed, we would recommend Texas as the best place for sheep-raising.

**THE NEW YORK HORTICULTURAL SOCIETY.**—The annual dinner of this flourishing society was held Tuesday evening, Jan. 8th, at its rooms, 55 West Thirty-third street, and was a most enjoyable event, being attended by a large number of amateurs interested in horticulture, as well as by the trade generally. The tables were elaborately decorated by a number of the New York and Brooklyn florists, while Messrs. Buchanan, Such, and Paterson sent beautiful groups of rare orchids, etc., that gave an exceedingly rich appearance to the tables. After the substantial of the dinner were disposed of the President, Mr. Jas. M. Paterson, in a neat speech, gave out the regular toasts of the evening, as follows: "The Horticultural Society of New York;" "The officers of the Society for the past year;" "The Gardeners of the United States;" "The Florists of New York;" "The Horticultural Press," and "The Ladies;" which were eloquently responded to by the following gentlemen in order: William Elliott, John Henderson (the late President), Peter Henderson (who claimed that American gardeners were as fully accomplished as those of Europe, instancing Messrs. Smith and Saunders, of Washington, as examples), Walter Reid, James Hogg, and John Laird Wilson. Eloquent, interesting, and telling speeches were also made by Messrs. Parsons, Such, Acton, Northrup, Nelson McDonald, and others, followed by a statistical statement from the President comparing the success of the Horticultural Societies of Boston, Philadelphia, Cincinnati, and New York. The "feast of reason and the flow of soul" was kept up with undiminished vigor until the closing song, "Auld Lang Syne."

**STANLEY'S PORTRAIT IN "HARPER'S."**—Harper's Weekly of the 19th inst. contains a most excellent portrait of Henry M. Stanley, the African explorer. Aside from its timeliness, the picture is a noteworthy instance of the perfection of the engraver's and printer's art.

**THE FIRST SNOW.**—On January 3 the first snow of the winter of 1878 fell in New York City. It was about a half inch thick. One hundred years from now the fact may be of interest.

#### HYDROPHOBIA AND RABIES.

In the *Nineteenth Century*, an English monthly review of the highest rank, Sir Thomas Watson contributes a paper with the above caption, which we consider the ablest and the most common-sense review of these topics we have yet seen. We will endeavor to give our readers an abstract of it, although the paper itself is remarkable for its clearness and terseness.

The rapid increase of hydrophobia in England is cited. In the twenty-four years prior to 1844 only two (2) cases of this disease had been admitted into St. George's Hospital, but since the beginning of the present year thirteen (13) deaths from hydrophobia have been recorded in the London registration.

As to the time of incubation of rabies in the dog this period is variable, as that of hydrophobia in the man. A cat which had been bitten by a mad dog inflicted wounds on two persons within a few minutes. The respective outbreaks of hydrophobia were separated by an interval of two weeks. As to dogs, the best known case is that of Lord Fitzwilliam's kennel in 1791, a mad dog bit six of the hounds. The disease developed itself at widely different intervals from the 8th of June, namely in 23, 56, 67, 81, 155 and 183 days. Sir William Gell is authority for a case of hydrophobia which was the result of a bite from a dog received five years before. One apparently well-determined case was of a lad who died of hydrophobia after having been bitten by a dog on the hip after five years. For twenty-five months before his death the lad had been in close confinement in prison, and out of the way of dogs entirely.

Sir Thomas Watson imagines that the virus implanted by the rabid animal may remain lodged in the bitten spot shut up perhaps in a nodule of lymph before general absorption and dispersion takes place. Sir Thomas Watson says:

"The symptoms of hydrophobia, stated in broad outline, are these: Excessive nervous irritability and terror, spasmodic contractions of the muscles of the throat, excited by various external influences, and especially by the sight or sound of liquids, and by attempts to swallow them, and sometimes absolute impossibility of swallowing them, earnest attempts to do so notwithstanding. When fluids are offered to and pressed upon the patient he will take the vessel containing them into his hand, but draws back his head to a distance from it with a repelling and apparently involuntary gesture; meanwhile he makes a succession of hurried gasping sighs and sobs, precisely resembling those which occur when one wades gradually and deeply into cold water. The sound of water poured from one vessel into another, gusts of air passing over his face, the sudden access of light, the waving of a mirror before his eyes, the crawling of an insect over his skin—these are things which, in a hydrophobic patient, suffice to excite great agitation, and the peculiar straining sensation about the fauces. He goes on rapidly from bad to worse; in most cases more or less of mania or delirium is mixed up with the irritability. Illusions of the senses of sight and of hearing are not uncommon. The sufferer is very garrulous and excited. In some cases, but not in all, there is incontinence of urine. Foam and sticky mucus gather in his throat and mouth, and he makes great efforts by pulling it with his fingers, and by spitting, blowing, and hawking to get rid of it; and the sounds he thus makes have been exaggerated by ignorance and credulity into the foaming and barking of a dog. In the same spirit the palsy of his lower limbs, which sometimes takes place, rendering him unable to stand upright, has been misconstrued into a desire on his part to go on all fours like a dog. Vomiting is a frequent symptom. The pulse in a short time becomes frequent and feeble, and the general strength declines with great rapidity. Death occasionally ensues within twenty-four hours after the beginning of the specific symptoms. Most commonly of all, it happens on the second or third day; now and then it is postponed to the fifth day; and in still rarer instances it may not occur till the seventh, eighth, or ninth day."

Sometimes all paroxysms cease, and there is no apparent disquiet. A case is cited of a patient in Middlesex Hospital, who was apparently improving, both to the surprise of the doctor and patient, but in half an hour he sank and expired.

Between tetanus and hydrophobia there are these marked differences: In tetanus there is a rigid and abiding form of spasm, which relaxes gradually and slowly, whereas in hydrophobia the spasms are sudden and frequent, such as are known as convulsions. In tetanus there is no thirst, seldom any vomiting, no accumulation of tough and stringy mucus in the mouth and throat. In tetanus the mental faculties seem unimpaired.

Youatt's description of a dog affected with rabies is well known. One peculiar trait worth noticing is the tendency of the animal to swallow bits of thread or silk from the carpet, hair, straw, and even dung. A flow of saliva about the second day is noticeable. Palsy often affects the loins and extremities, and the animal staggers and falls. Mr. Youatt fancies the dog is subject to what we call spectral illusions; his bark is hoarse; respiration is affected; often breathing is laborious, and inspiration is attended with a singular grating, choking noise. But dogs with rabies do not shun water. They have no dread of water, but unquenchable thirst which they cannot satisfy, from a paralysis of the lower jaw, which prevents their shutting their mouths. It does not appear to be true that healthy dogs shun mad ones; they do not manifest any fear; nor is it at all apparent that the mad dog exhales any peculiar and offensive smell. It seems that the disease may be imparted by a dog who has been bitten by a mad dog before rabies is manifested in the first animal. A case is cited of a small terrier who was bitten by a mad dog. The terrier was almost immediately killed, but not before he had licked the cropped ears of a bulldog puppy, which puppy went mad eight weeks after his ears had been licked.

Some time ago, in the FOREST AND STREAM, we cited some cases of other animals than dogs having rabies, but stated

that we believed that in all well authenticated cases the animals had been bitten by mad dogs. The case of the death of the grandfather of the Duke of Richmond, in Canada, by the bite of a fox, has often been cited, but from later information it seems uncertain whether the bite was inflicted by a dog or a fox. That deaths from hydrophobia have occurred from cats is quite positive. As to the disease caused by the scratch from a cat, Sir Thomas Watson thinks that cats with rabies, licking their paws, might have imparted the disease. A case of hydrophobia, through a scratch inflicted by the tooth of a horse, seems to be authentic. In the last number of the *Veterinary Journal*, the case of a charger, the property of a Captain Cotton, of the Twenty-first Hussars, is given in detail. First noticed on the 14th of September, the animal died on the 17th. The horse had been bitten by a dog in the near hind leg, but it was only afterward that this wound was associated with the peculiar symptoms the mare exhibited and its origin suspected. Now comes the vital question: Is a man who has been bitten by a mad dog, and in whose case no preventive measures have been taken, a doomed man? Sir Thomas Watson writes:

"I have answered this question in the negative already. Few, upon the whole, who are so bitten, become affected with hydrophobia. John Hunter states that he knew an instance in which, of twenty-one persons bitten, only one fell a victim to the disease. Dr. Hamilton estimated the proportion to be one in twenty-five. But I fear these computations are much too low. In 1870 a mad dog in the neighborhood of Senlis took his course within a small circle, and bit fifteen persons before he was killed; three of these died of hydrophobia. The saliva of a rabid wolf would seem to be highly virulent and effective. These beasts fly always, I believe, at a naked part. Hence, probably, the fatality of their bites. The following statement relates exclusively to the wolf: In December, 1774, twenty persons were bitten in the neighborhood of Troyes; nine of them died. Of seventeen persons similarly bitten in 1784, near Brive, ten died of hydrophobia. In May, 1817, twenty-three persons were bitten and fourteen perished. Four died of eleven that were bitten near Dijon, and eighteen of twenty-four bitten near Rochelle. At Bar-sur-Ornain nineteen were bitten, of whom twelve died within two months. Here we have 114 persons bitten by rabid wolves, and among them no fewer than sixty-seven victims to hydrophobia."

With the utmost respect for Sir Thomas Watson's opinions, we do not place implicit confidence in the wolf story; the dates are too far distant, and the authorities not reliable.

"There is no doubt, however," continues Sir Thomas Watson, "that the majority of persons who are bitten by a mad dog escape the disease. This may be partly owing to an inherent insipidity for accepting it. There are some upon whom the contagion of small-pox has no influence. This peculiarity exists apparently even among dogs. There was one dog at Charenton that did not become rabid after being bitten by a rabid dog; and it was so managed that at different times he was bitten by thirty mad dogs, but he outlived it all. Much will depend also upon the circumstances of the bite and the way in which it is inflicted. If it be made through clothes, and especially through thick woollen garments or through leather, the saliva may be wiped clean away from the tooth before it reaches the flesh. In the fifth volume of the *Edinburgh Medical and Surgical Journal* there is a case described by Mr. Oldknow, of Nottingham, in which a man was bitten in three different places by the same mad dog, namely, in the groin, the thigh and the left hand. The bite on the hand was the last. Now, it seems that but for this last bite on a naked part he might have escaped. It is noteworthy that the local sensations preliminary to the fatal outbreak of hydrophobia occurred only in the hand and arm. The attacking dog probably shuts his mouth after each bite, and thus recharges his fangs with the poisonous material. In a report from America it is stated that of seventy-five cases the injury was received on the hand in forty instances, on the face in fifteen, on the leg in eleven, on the arm in nine. It is this frequent immunity from the disease in persons who have been bitten that has tended to confer reputation upon so many vaunted methods of prevention. Ignorant men and knavish men have not failed to take advantage of this."

As a help toward determining whether a dog has rabies after it has been destroyed, our most eminent authority states that, in examining the stomach of the dog, if unnatural contents be found within, such as straw, hay, coal, sticks, horse-dung, earth, as well as a quantity of a dark fluid like thin treacle, proof is positive that the dog was mad.

To render dogs mad a great many attempts have been made, but without success; dogs have been starved and subjected to many cruel experiments, but without success. The act of using extra precautions, as in summer, is preposterous. As a preventative against one dog biting another, it might be useful if employed all the year round. To muzzle these dogs in hot weather is both cruel and stupid.

The terrible fact that the saliva of a rabid dog or of a human being can impart hydrophobia we are inclined to believe. If any credence can be placed on the authority of M. M. Majendie and Breschet, both illustrious men, two dogs were inoculated with the saliva of a hydrophobic man, on the 19th of June, 1813, and on the 27th of July both dogs went mad, who in their turn bit other dogs, who all showed rabies. That the virus is absorbed in the system is evident from the fact of sheep sucking their lambs, the mothers only having been bitten by a mad dog, when both the mothers and their suckling lambs died.

Now, as to the cure. "The early and complete excision of the bitten part is the only means of preservation in which much confidence can be placed; and even then that is open to a source of fallacy. In the majority of cases no hydrophobia would ensue, though nothing at all were done to the wound. No doubt many persons undergo the operation needlessly. But in no given case can we be sure of this." Mr. Youatt tells of having cauterized more than 400 persons with nitrate of silver, all bitten by dogs unquestionably mad, and that he never lost a case.

In St. George's Hospital some 4,000 persons have been

treated with cautery, and no fatal cases have been reported. But excision, in Sir Thomas Watson's judgment, he thinks, is the most trustworthy and eligible procedure. Though Trousseau recommends actual cautery, by searing with a red hot iron, our authority thinks the free use of nitric acid, by means of a glass brush, would encompass the end desired. *Early excision*, Sir Thomas Watson thinks, is a sure preventive, "but in all suspicious cases, if the operation has been omitted in the first instance, it will be advisable to cut out the wound or its scar within the first two months, or at any time before preliminary feelings on the spot foreshadow the coming outbreak. Later, it would be too late." A case is recorded where these symptoms were manifest, and though amputation was resorted to, hydrophobia was developed, with the death of the person.

"For my own part," writes Sir Thomas Watson, "if I had received a bite from a decidedly rabid animal upon my arm or leg, and the bite was such that the whole wound could not be cut out or thoroughly cauterized, my reason would teach me to desire, and I hope I should have fortitude enough to endure, amputation of the limb above the place of the injury."

Believing hydrophobia to be fatal, this authority recommends a liberal use of the hydrate of chloral, "to quiet the restless agitation and to mitigate the sufferings of its inevitable close."

What should be done by or for a man bitten by a rabid animal? Should the wound be sucked? Such a method as suction would not be expedient. The sufferer might imperil the life of him who gave his aid. The same process as is in use for a snake bite is suggested. *A ligature should be tied as tight as possible above the wound, between it and the heart; next, a continuous stream of tepid or cold water should be poured from a height upon the wound. This might be done from the spout of a tea-kettle or from a water-tap. But this is simply temporary or palliative. As soon as possible a surgeon should be called in, and excision or cauterization must be used; and, to be safe, both of these methods of treatment.*

As far as can be possibly ascertained there has never been a case of rabies that was not discovered to have been propagated. Now, how can this germ of rabies be entirely extirpated? Mr. Youatt proposed that all dogs should be quarantined (separately, of course,) during some seven months, then, if an animal was inclined to have rabies, the disease would determine itself, and the dog could be killed. Sir James Bardsley proposed a similar scheme. Sir Thomas Watson favors this plan, being persuaded that if resolutely grappled with, notwithstanding all the difficulties of enforcing such an act of dog quarantine, the disease might be exterminated.

As to breeds of dogs most prone to rabies, we believe there can be laid down no rule. The reported prevalence of rabies in spitz dogs we are certain had no foundation. The theory has been advanced that dogs of mixed breeds, curs, in fact, had a tendency to rabies. This, too, we are quite sure, has no basis of fact. As to sex of animal, no data worthy of credence have ever been presented, since dogs and bitches may be bitten indifferently by a mad dog. What is positively known, however, is this, that rabies is a disease of animals in the temperate zone, and that in the tropics and in the Arctic regions rabies does not exist. It may exist in New York, and is almost unknown in Savannah, or south of it. The dogs of the Arctic explorers, it seems evident, do get crazy, or insane, together with some other malady not well described, and die, but are not afflicted with rabies.

Starting, then, with this indisputable fact, that if there were no dogs there would be no hydrophobia, it follows that the less dogs we have, exactly by so much are the chances diminished of dogs being bitten by mad dogs, and of the disease being propagated. There should not be allowed any stray dogs in the whole country.

In our last issue we published an interesting letter from Dr. Yarrow, U. S. A., and his method of treatment was precisely like that recommended by Sir Thomas Watson. From Dr. John T. Nagle, Registrar of Vital Statistics of the City of New York, we have received the following data. "The total number of deaths reported to this bureau during the year 1877, from hydrophobia, was four, as follows: One death in persons between two and three years, one between four and five, one between fifteen and twenty, one between fifty-five and sixty."

## VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 10.

By THE EDITOR.

JANUARY 7, 1878.

MY FRIENDS: As we wander among the imposing remains of the once proud city of Duluth, we are inevitably reminded of ancient Athens, which is magnificent even in its decay. The stately edifices of sandstone abutting on the main thoroughfare in isolated grandeur and individuality; the spacious private residences which here and there occupy the ledges of the overshadowing rock behind the town; the extended avenues; the tremendous sweep of suburbs; the immature local improvements; the metropolitan features grouped around the focus; and, above all, the price of city lots;—these, in the titanic scale of their projection, are commensurate only with the anticipated magnificence of the completed plan. Here, in the golden epoch of ingenious schemes and far-reaching projects, were concentrated the business sagacity and acumen of the land. Shrewd speculators congregated in crowds, like buzzards, upon the long corridors of Col. Hull's notable caravansary, and watched the incoming steamers bringing green

backs and more speculators from the East. Hungry and consuming locusts, grasshoppers, flies and drones swarmed around the bung-hole and got stuck in the molasses. Real estate agents vied in selling to the credulous choice lots at \$5,000 each, upon which it was expected that \$100,000 structures would eventually stand. Stupendous public buildings were designed; and all around the printed plans and elevations thronged a rabble of ex-generals and colonels, c-devant senators, broken merchants, bankers, and impecunious adventurers, jostling each other and scrambling for civic offices and emoluments in the high places to be created. Sitting in the lowly places and gazing up aloft to the summit of the boulder-strewn ridge of rock, up whose semi-precipitous acclivity ambitious shanties had already climbed in straggling disorder, one could almost fancy an Acropolis or Parnassus, with Socrates and Plato pronouncing from the top, and declaring, with Proctor Knott, that this was destined to be the greatest place on God's earth!

One early morning, before the sun was up or the citizens had stirred, I toiled with panting effort up one of the outlined avenues, which looked charmingly level on the maps, but was too steep for any vehicle to climb, and when I had surmounted the apex I looked out over a landscape so far-reaching that its scope seemed marvellous. To the eastward Lake Superior stretched out in an expanse which apparently had no limit. A range of rocky bluffs followed the northern shore on the left. On the opposite shore was Superior City, so distant as to be scarcely discernible in the morning light, and between the two lay a placid bay, into which projected a natural causeway which followed the curve of the shore in a parallel line. On the circumscribed level plat below was the business part of the town, with the machine shops and sheds of the Northern Pacific Railroad a little beyond. In the distance a considerable stretch of grass and open water indicated the *debouchure* of the St. Louis River, which empties itself over ledges of rock in a series of cascades and rapids. Contemplating seriously the natural outlook and the geographical lay of the land, the advantages of the location in a commercial point of view are obvious; and one cannot help but feel assured that the expectations of those who had hoped years ago to found an emporium at this available gateway of the State and the great West beyond, will yet be realized. Situated at the very extremity of this great inland sea, Duluth is the funnel into which flows the current of all the trade that comes by water. The Northern Pacific Railroad, already extended 550 miles, is the outlet, and all the grist that is carried to and from the mill pays tribute and toll right here. Eventually this great artery of communication will be continued across the continent; meanwhile, notwithstanding its disabilities and disasters, its earnings of the year 1877 show that it can sustain itself. There is a large and growing community beyond its terminus, whence, and also from other points along the completed line, well-appointed stages carry passengers to Deadwood and the embryo cities of the Black Hills. Over these stage routes the traffic has been large throughout the past year, despite the hostilities of Indians and the depredations of road agents.

Between Duluth and Brainerd on the Mississippi River, the country is well occupied with farms, stations and settlements, and one sees little to remind him of border life. At Brainerd, however, trains rest over Sunday, compelling a temporary halt of all through travel; and here at Col. Weed's "Head Quarters Hotel," can be seen typical characters of all sorts. Here are Black Hills' merchants coming East for goods; express agents guarding treasure *in transitu*; emigrants, red hot with the gold fever, bound West; gentlemen-sportsmen with dogs, plethoric outfits, and a retinue of servants—"well heeled," as they say out there—going to the grouse country; occasional army officers attached to frontier posts, scouts, trappers, stock-grazers, surveyors, and representatives from British Columbia, factors, merchants, officials, half-breeds and Indians. The latter are frequent visitors who generally set up their tepees on the bluffs on the river side, and along the outskirts of the town, where they lounge, mend canoes, and beg. There are two reservations not many miles off, where they may be interviewed by the curious on their own allotted territory. Very often little knots of passengers by the Deadwood stages may be found in the centre of a crowd, lugubriously relating how the road agents halted them, ordered them to "squat" and "hold up their hands," and "went through them;" just as they did once with old Ben. Halliday, the great overland stage proprietor, holding a double-barrel shotgun within a span of his face, and scratching his nose with the muzzle when he told them it itched. Cautious and experienced travelers, let me say, carry very little money with them; only checks or drafts. Possibly among the miscellaneous throng at Brainerd, are the same veritable desperadoes and highwaymen. It is probable that detectives are there who know them. But they are not recognizable by the chance traveller. If anybody supposes that he will find here desperadoes *en grand tenue*, trappers in buckskin, and bullies in buckram, he will be disappointed. When the dwellers of the plains and mountains pack up to travel East, they don store clothes, and buy or borrow a "clean billed shirt." They voluntarily surrender themselves to the conventionalities of society for the time being, and are on their good behavior. It is a luxury to one who is daily elbowed by the throng on Wall street or Broadway, to notice the social amenities that are observed. One cannot but admire the universal affability of rough men—a marked quickness of manner, gentleness of address, civility in answering general inquiries, careful avoidance of personal jests or practical jokes, a studious disinterestedness in

other people's affairs, and a commendable mind-your-own-business style not appreciated in the South and East. The roughest garb oftentimes covers a brilliant intellect, while the prevalence of superior information on general topics is quickly remarked. The reason for this can be easily understood, on patent ground, namely: It may be taken for granted that any person who has pluck enough to work his way out West and brave the hardships and dangers of pioneer life, has something in him more than the stuff that common men are made of—qualities above the average, and a degree of intelligence requisite to enable him to avoid, combat, and surmount the difficulties that continually beset him. These qualities, engrafted upon native stock, make up the indomitable American character. To cure vanity, selfishness, petulance, loquacity, cholera and pugnacity, try the Western air, young man: it is a panacea.

Brainerd, like Duluth, got a blow under the belt when the Northern Pacific Railroad "went up" four years ago. It was a blow which did not make it double up: it has now about half the population it had then. When all was activity and bustle among its 5,000 people, it was a place for residence or money making. The streets are laid out at right angles in the midst of a pine and hardwood forest; the houses are comfortable and neatly painted; a public square has been set apart among the pines, the underbrush being cut away, and intersecting avenues laid out. On three sides of it are pretty churches. Its farthest limit is the high bluff by the river side, where the Mississippi rolls in deep and placid volume. Its principal business street is built up with stores; but a fire cut out the most pretentious of them some time ago. I notice that most Eastern people have obtained the notion that the frontier buildings of our remote West are dug-outs, log cabins, and tumble-down shanties. They will be surprised to find great school-houses of brick in the open prairie, substantial frame farm-houses, and as tasteful churches and ornate private residences in the towns as can be found in the villages of older States. A very substantial bridge crosses the river, giving appreciable advantages for the capture of large catfish, which take the hooks freely. The Railway Company's offices are elegant and imposing. They are in charge of H. A. Towne, Supt., R. H. Morford and T. C. Fernald, a gentleman whose experience among the Indians, and general knowledge of Indian character, are very large. The "Headquarters" is a large and commodious hotel, noted for its good cheer and the rough gambols of its hospitable landlord, Col. E. W. Weed, a gentleman who has filled many offices of responsibility and trust on the frontier. He had charge of one of the construction gangs which laid track at the rate of (?) miles an hour on the day when the iron ties were joined across the continent. I am indebted to him for the finest turn-out I ever saw let loose on the prairies after grouse.

Let me see how it was: Tom Cantwell, the "Wild Rice Man,"\* had notified me by telegraph to be in readiness on a given morning. I arrived only the night before, but my only preparation involved a change of clothing; for I have my kit always packed and ready. Everything which experience has taught me I need for my personal comfort will be found among its contents, from a rubber blanket to a piece of chalk. So, when the morning came around, I had it stowed in the wagon, and sauntered off to look at my friend's kennel. I found a summer lodging-house, and a winter quarters partly under ground, but well ventilated, inside a high fence inclosing an ample exercising yard. Clambering up a ladder and looking over, I saw a comical sight. All the dogs had mounted to the top of the winter house for better observation, on hearing us approach, and there they sat like the rescued in the painting of The Flood. On the show-bench they could not have been in better position for examination. "That chap there," said Tom, "is my blue pointer 'Yankee,' bred by N. C. Howard, of Dayton, Ohio; the next is 'Blix,' a black pointer, whose sire is Dr. Strachan's champion 'Pete'; those two cocker spaniels are 'Punch' and 'Syrup,' and the springers are named 'Gypsy' and 'Tory.' I think Yankee is as good as they make anywhere."

Well, it came to pass in due time that we tried the mettle of Yankee's breeding, and a truer dog I never care to shoot over. Ned Hicks was along with his blue pointer Count, Yankee's sire, and the setter Sullivan. Hicks is one of the surest wing shots I ever saw, and death on hawks when no chickens are flying. He made them "come" every time, often at incredible distances, shooting from the wagon as the team walked at speed over the prairie. Together we shot four varieties of hawks, I believe. By the way, a fast trotting horse is a most desirable acquisition in grouse shooting, and worth thirty per cent. more for a tally than a slow one. Indeed, for constant daily service on the plains or mountains the fast walker is of more value than a trotter. For travel day in and day out one seldom cares to trot. A good walker ought to do four miles an hour for ten hours per day for weeks together. I once rode 1,200 miles in five weeks over the mountains of the Blue Ridge, and the beast got fat on it.

On that trip we three, in Col. Weed's wagon, beat over many miles of prairie on both sides of the river from Brainerd down to Lake City, and across the Mississippi to Fort Ripley, and eighteen miles beyond. If we got but few birds it was not the fault of outfit, dogs, or gunners. Two more tractable horses under fire or better steppers on grass I never saw. The dogs had rare pluck, as the sequel showed. There was plenty of ice in the chest, pure water in the butt, and

abundant provisions in the larder; of camp stuff, guns, and ammunition, a full complement. All the conditions were favorable for a wagon load of birds except the hot and dry weather, which, as all know, occasioned absence of birds. But the scarcity of birds only made the hunting better. ("The less game, the more hunting," is an epigram which has become an axiom.) In the comparative cool of an early morning we helped the dogs into the wagon and "lit out." The dust flew in clouds as we howled out of town at a spanking gait, settling in a white shower upon the foliage of the pin-oaks that girted the roadside for several miles. The country was a wooded flat, with occasional undulations, and sometimes a dry bed of a creek, or a gully which the spring rains had washed out. After several miles driving the oaks broke off abruptly, skirting a broad treeless and fenceless prairie, overgrown with low scrub and grass. The outlook was monotonous, relieved only by an isolated elm or burr oak in the far distance, or a tall pine towering like Anak in the front ranks where the forest met the open field. Here the wagon left the road abruptly; the dogs were bounced out of the bottom and motioned afield, and in five minutes we were alert, with Count and Sullivan ranging wide, and Yank in the middle ground. As soon as the dogs showed up we were over the wheels and off to the front in a jiffy, while the driver followed with the wagon at discretion. Presently a white gleam shot up out of the green, glowing for a minute in the sunshine—then another, and one more—giving each man a bird, and every one dropping in handsome style to first barrels. But no more got up, and so the dogs were told to "seek dead," and presently they handed us tenderly the limp and warm bodies, from which the bird-life had just flown heavenward upon the little clouds of blue smoke that floated off on the air. We picked up two or three more birds on that prairie after an eight-mile tramp, and then tossing what we had shot into the wagon box, called the dogs in, gave them water, and drove on across-field to a line of cottonwoods which marked the banks of a river, still in good stage of water. There we camped in a log cabin belonging to a well-to-do Frenchman who runs a large grist mill which grinds all the grain for a circumjacent area of thirty miles in diameter. The Frenchman kept an inn, of which our log cabin was one of the detached dormitories. Its only furniture was a table, which was more convenient in some respects than either pegs, shelves, or brackets; but there was ample room on the clean floor for spreading many skins and blankets, and there we luxuriated in sleep and rest. In the morning we walked a few rods to another log house, which was a combined kitchen and dining room, and breakfasted on prairie-chicken, bacon, and potatoes. In a year or two that Frenchman may feel able to erect a handsome and commodious dwelling commensurate with the size and importance of his grist mill, which cost, I believe, \$16,000, and is really an extensive establishment.

Our work that day began at sun-up. At noon we dined sumptuously at Lake City, and at dusk reached Dan Moore's stock ranch, on the Mississippi River, opposite Fort Ripley, and about two miles distant from it. Although we worked hard throughout we tallied low. The weather was too dry for scent, and there were evidently no birds in the country. If several dogs together range faithfully as ours did, when the scent does not hold good to the ground, they will cover a good deal of area and run over nearly every rod of it; and if birds are there they will flush many that they do not nose of. (Knows of, is good!) Of course some birds may fail to discover themselves, but the presumption is that if no sign whatever is manifested the birds are not there. Moisture, of course, makes a hot scent. Flowers are sweetest when the dew is on them. The grasses give out pungent odors. The scent of the bird lies low and clings to the ground and surrounding verdure. Hence the disadvantage of a drought to the sportsman. I speak of this not as a novel fact, but because most experienced writers omit instructive points, which seem trivial to themselves, but which are especially valuable to the tyro. I for one am not ashamed to take my college diploma into the A B C class.

There are not in autumn so many agreeable contrasts and colors in Minnesota as in mid-summer. In the higher latitudes the atmospheric illusions are not so constant and striking as they are farther south. The scenery is more like that which one sees at the east. The varieties of plants and trees are much the same, and the big belts of timber, which cross the State at intervals, remind me of Maine. It is only when one strikes off into an open prairie, out of sight of all landmarks, as it were, like a ship at sea, that he feels any novelty in the situation. At such times the inexperienced new-comer is bewildered, lost and helpless. Traveling over the boundless expanse seems like voyaging in a balloon, and open-air existence becomes a sort of day-dream, fleecy and without form. In parallel districts along the Mississippi River, however, one need only consult his compass and follow due east or west to extricate himself from a dilemma, and find a highway that will lead him to friendly shelter, or to New Orleans.

One seldom sees any snakes in this region except the harmless grass and garter-snakes; but the prairie is bored by sand-rats and honeycombed with gopher holes, into which unwary or unlucky horses often step with serious damage. There are squirrels among the oaks and hazels, screaming jay-birds on the tree-tops, and rabbits that hide in the bunches of grass, where they make their forms. Crows, hawks and flickers are very common, and black-birds often fill the air in passing clouds of vast extent.

Coursing along beside the Father of Waters at eventide, when the after-glow of sunset rested on its broad bosom and illumined its wooded islands, we listened to the evening twitter of the cow-buntings and the sharp call of the cat-birds. Gradually a sense of weariness and hunger came over us. By the time the extensive hamlet of Dan Moore's rancho hove in sight, we were ready to stretch our limbs anywhere, in hay-stack, loft or chamber. Buildings and stockyards lined both sides of the road for many rods. Barns gushed with garnered hay and grain, and numberless stacks outside complemented the superabundance of a fulsome harvest. Lowing of kine and the bellow of blooded bulls made the air resonant. Turkeys and chickens without number leisurely sauntered off to roost, and great corpulent hogs wandered about at will, whose insolence and intrusiveness the artifices and courage of the good dog Ranger could hardly circumvent or check. When he had to take them by the ears they would give him a side-long glance to see if he "meant business," and then shuffle off with a shrug, turning up their noses and saying, deprecatingly, that it was "rough, rough, rough!" The place was crowded with wagons and wayfarers, like a fair or market-place. Possibly there were thirty brawny farmers, wayfarers, herders and sportsmen, all of whom, it seemed, desired accommodation for man and beast, and lodgings for the night. Now, it so happens that Dan Moore, although he is one of the wealthiest men and most frequent prize winner in the State, has pitched his tent exactly on that part of the traveled thoroughfare which is most convenient for the wayfarer and intermediate to other focal points. There are no other houses near him, and so he is obliged to entertain, willy nilly. His house is a large two-story log house, fully fifty feet front, and being in process of repair the outside sheathing and clap-boards had been torn off, leaving spaces between some of the logs large enough for a man to shove his leg through. All the partitions were down, making one immense room in which a portion of his guests bunked. (Mosquitoes might have been troublesome but for bars which carefully protected the windows.) Other guests found lodging room in garrets, barns, outbuildings and haystacks.

Before apartments had been allotted, I laid me down upon the grass beside a bob-sled to snatch preliminary rest. The sky had become overcast with clouds, threatening rain; it was so dark that objects were scarcely visible. There was some commotion among a gang of cattle—bills, cows and heifers—which were self-corralled in an angle of the large barnyard, but practically at liberty. Dan sent Ranger to quell the disturbance, and his efforts set the herd in motion until he had them well scattered over the premises. They hustled all about the place, and charged hither and yon in droves and by twos and threes, investing the bob-sled and making my situation precarious and anything but cheerful. I made myself as thin as possible and snuggled closely to the side of the sled, for a while, but took the first chance to "skin out" and make a break for safer quarters.

This dog Ranger was the best trained watch-dog I ever saw, a cross between a bulldog and a mastiff, if I am not mistaken. He was perfectly docile and harmless. Unbidden he would never molest or threaten man or beast; but having once received orders from his master he would tackle the prize bull or charge the barn door without hesitation. He was not a very large dog, but very powerful. His habitual amiability was the strongest part of his composition, for trained watch-dogs are almost invariably ferocious, the system of training tending directly to make them sour. What method of instruction Dan employed to combine opposite characteristics in the one animal I know not. The usual method, as given in printed works, would not answer at all.

A little rain fell during that night but held up in the morning, when the clouds being broken, we determined to cross the government swing ferry in the flat-boat, which was worked by the only two soldiers left in charge of the now dilapidated and decaying post called Fort Ripley. Extending our journey many miles beyond the Mississippi we made a small bag of sharp-tails, and turned into a farm house for dinner. When we started for home the sun was shining, but a tremendous storm of rain soon came up on a driving mass of clouds from the west, and from that time on until we were housed at our hotel in Brainerd, at 9 o'clock at night, it poured in drenching torrents. Waterproofs were but small protection. Everything in the wagon was afloat and drenched. There was no room for the dogs, and the poor creatures had to foot it for seven hours, twenty-four miles, in the continually deepening mud and water; yet, to their staunchness, be it said that they showed few signs of distress the next day, and on the day succeeding were as good as ever. The dry prairie, which was dust the day before, became a shallow lake. In the groves of oak the rain beat down so as to raise cinctures of foam several inches high around the butts of the trees. The dry beds of the creeks were bank-full and scarcely fordable. There were wash-outs all along the line; and in the dark traveling became hazardous. Glad were we when the lights of the town loomed in sight. The streets were all under water, but taking our bearings by the beacon that gleamed from the Head Quarters Hotel, we drove up along side the welcome platform through a lake eight inches in depth, and making one desperate leap for shelter, speedily "shucked" ourselves and were happy once more.

The next day was Sunday. The sun shone out warm and bright, and no drop of water remained on the sandy bottom where the flood had risen the night before. HALLOCK.

—THE FOREST AND STREAM is \$4 per year in advance; \$2 for six months; \$1 for three months.

\* So designated because he has devoted much attention to the cultivation and distribution of wild rice in places where it is not indigenous.

(FROM OUR OWN CORRESPONDENT.)

## SPORTING CLUBS AND SPORTSMEN OF RUSSIA.

ST. PETERSBURG, Dec. 3, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Sir—One of the features of St. Petersburg is the sportsman's club. These exist in great numbers. Hares and foxes are found in abundance within twenty miles; elk, wolves, and bear within thirty miles. For this city is not the natural product of a thickly peopled country, but it was founded on a marsh, and built up by forced labor and forced residence, at immense expense, in order that Peter the Great might have an eye into Europe. The Petersburgers, too, needs exercise badly, for he rarely walks, and never rides on horseback. These clubs are expensive luxuries, for besides the annual dues, which are not small, no member can spend a day at the "chasse" without its costing him from eight to eighteen roubles—\$4 to \$9—according to the distance of the club-house from the city, the nearest being the most expensive.

Sunday is the favorite day for the "chasse," though it frequently takes place on other holidays, mostly saints' days, of which there are about eighty in the Russian calendar, making, with the Sundays, about one-third of the year holiday, when all labor is suspended. How can a poor country grow rich at this rate?

Every Saturday afternoon the trains take large numbers of sportsmen into the country. They are dropped at the stations along the roads, principally along the rail to Moscow, and thence into Finland, at distances varying from ten to thirty miles from the city. The club-house is lighted and warm, and a good dinner, provided by the steward, to be preceded by the inevitable "zacasaska." Why the Russians insist upon eating a preliminary dinner just before the regular meal I have never been able to understand. No people do it but the Russians and Swedes. They say it increases the appetite. My experience is that it takes it away. In a side room, or at the further end of the dining-room, you find spread out on a separate table, caviar, cheese, pieces of salt fish, salmon and herring, anchovies, bologna sausage, etc., etc., all to be washed down by a glass of kimmel, or kimmel and bitters, cognac, or vodka. Vodka is the Russian brandy, the poorer quality being made from potatoes, the better from wheat and rye. Five or ten minutes' devotion to these, and you have dined pretty well, whereupon you are expected to sit down and consume your regular dinner of many courses.

After dinner follows a rubber of whist, with low stakes, for though the Russians have the name of playing high at the public gambling tables of Europe, and there are of course some high players at St. Petersburg, yet as a rule they play low. The play at the clubs is by no means as high as in London or Paris.

It was my good fortune to be invited by a friend to attend one of these parties. We took the Finland train at six o'clock in the evening, and at half-past six reached our station. There carriages awaited us, and we drove to the club-house, some ten minutes off. The house is like a small hotel, with a large dining-room, a small sitting room, and many small bed-rooms opening upon the passage, all heated by the Russian stove, a mass of bricks and cement, retaining the heat long after the fire is extinguished. There is an impression in other countries that this heat is disagreeable, and even unhealthy, but I have not found it so. I believe that it is because these stoves are always heated with wood.

Seven o'clock found us seated at dinner in a dining-room hung with sporting pictures, heads of elk, and stuffed capercaillies, the king of Russian birds. The most striking picture was a large oil painting, representing a wolf attacking a peasant. This was an actual event, but is a very rare one. In packs, wolves, when hungry, will attack anything, but scarcely ever when single. In this case the beast got the worst of it, for the peasant had been chopping brush wood, and was armed with his broad-bladed hatchet. After dinner we had our whist, the game being the same as with us, but the counting complicated and curious, the principal peculiarity being, that the honors contribute nothing to winning or losing the game, while they do contribute largely to the amount of the stakes, being counted in the number of points won or lost, when the game has been decided by the tricks.

At six o'clock the next morning a bugle rang through the hall, and we were all soon about. At half-past six a substantial breakfast was ready, with excellent coffee, and at seven we were en route, each man in his private cart, without springs, drawn by one of those intelligent, tough, spirited little Finland ponies.

We had to drive twelve verstes—eight miles—through water and fearful ruts; and the dorsal column suffered in consequence. There is nothing like the Russian boot for a tramp through mud and water. It comes up to, or near, the knee, as you prefer, and a strap fastens it tight to the calf to prevent the water from penetrating between the boot and the leg. It is really waterproof, light, warm and soft, and you may walk on it for miles without fatigue; neither is it dear, for eight dollars will purchase a pair that will last for years. There is another capital Russian institution for cold weather or for exposed stands when hunting—a sheepskin coat. The Russian peasant wears it universally. For sportsmen they are made of finer and softer wool, and embroidered fancifully with colors. They are perfectly waterproof. They are warm, with the wool inside, and reminds one forcibly of the deer-skin coats worn by our trappers on the plains.

As we approached the scene of action we overtook a num-

ber of men, women and children hurrying along the road. These were the beaters, who had got up long before daylight to reach the ground. They are paid fifty topecks—twenty-five cents—for their day's work. Not long ago they followed the example of their betters in western lands and struck for fifty cents. But the sportsmen were firm. They said that the hunts always took place on holidays, and that the beaters enjoyed the sport quite as much as the sportsmen. Plenty of beaters were found willing to come from distant villages for the old wages, and so our strikers surrendered at discretion.

Arrived at our first stand, we were posted along a wood-road, some fifty yards apart. We numbered fourteen guns and about forty beaters. They told me that the guns were too many for the beaters. There should be at least five beaters to each gun; five are better. The chief huntsman, distinguished by a red cap and a bugle, after he had stationed us at our different posts, disappeared in the woods followed by his motley crowd. There was perfect silence for half an hour, when a bugle note was heard, and in an instant all the horrid noises that human ingenuity can suggest filled the woods and gradually approached us. But while the noises did, the game did not. One solitary white hare crossed the road and was blazed at by my left-hand neighbor. I gave her one barrel, but made a beautiful miss. Then we changed guns and tried it again; but the weather was fearfully against us. The woods were full of water, and it began to rain. In the short days of November we had time for but five beats, the result of the whole being twelve hares and one capercaillie, less than one head of game to a gun.

The white hare is a beautiful animal, quite as large as the English hare, and three or four times as large as a rabbit. Nature has provided the poor brute with an admirable defence. In summer it is brown and is with difficulty distinguished from the ground. In winter it is white, and it is almost impossible to distinguish it from the snow—in fact the sportsmen do not attempt to shoot it when the snow is on the ground. The white hare does not take to rapid flight like its English sister, but hides itself in the hollows and hops quietly along behind bushes, trying to save itself by concealment rather than rapid flight.

The capercaillie, cock of the woods, or *titiirka*, as the Russians call him, is a beautiful bird, weighing about twelve pounds. The plumage of the cock is very brilliant. Although not exactly like that of the cock-pheasant, it bears more resemblance to it than to any bird I can name. He lives almost exclusively upon a wood berry, resembling our winter-green, and his flesh derives a very pleasant flavor from it. In the spring he is stalked with great success. The wicked sportsman takes advantage of his gallantry to his mate. He sits upon a branch and calls her. For a minute or two his note is a simple chuck, then follows a prolonged note, impossible to produce in writing, but something like a hiss. While uttering this he puffs out his throat, shuts his eyes, closes his ears, and remains literally blind and deaf. During this instant of time the wily sportsman runs in on him. He has time for three or four steps, but must then stand like a rock. The bird seems to take no notice of a stationary object. Again the poor, anxious cock calls to the wife of his bosom, and again the fell destroyer approaches, till, finally, a well directed shot tumbles him from his perch, and he sings no more. The widow renarries.

There is one thing which is never neglected on these sporting occasions in Russia—the supply of the inner man. A cart had followed us all that distance, loaded with cold meats, cheese, caviar, and beer and claret. A table was spread in the opening in the woods, boards rigged up for seats, and full justice done to the provisions. A very dark drive, in which we were obliged to trust more to the sagacity of our ponies than to the skill of our drivers, landed us all safely at the club-house. A comfortable dinner, followed by some charming songs by the Belgian Minister, who is a member of the club, brought us to ten o'clock, when we were whirled away in *troikas* (three-horse caleches) to the city, and the club-house remained silent and empty, till another holiday hunt gathers its members and their guests within its hospitable walls.

W. W.

## GAME PROTECTION.

NEW JERSEY.—The citizens of Ocean and Burlington Counties held a mass meeting at Barnegat the 3d inst., at which it was resolved that to prevent the total extinction of the fishing a law should be passed prohibiting all fishing with fykes, pounds, seines, from Jan. 1st to Oct. 1st, for a period of three or five years. Committees were appointed to confer with the representatives of other counties. We hope to see determined action and good results.

POTTSVILLE GAME PROTECTIVE ASSOCIATION.—The Pottsville Game Protective Association have just received their first invoice of live quail. The total number shipped was one hundred and eighty-six; the loss by transportation, twenty-four; the loss since date of receipt (Dec. 31, 1877), sixteen. The association numbers eighteen members, and have leased the shooting right of some three thousand acres of the best land in our county. This has been found, after one year's trial, to work satisfactorily. The Association thinks seriously of enlarging their grounds, and are purchasing and preserving quail for the purpose of stocking the same. The officers of the Association are: Col. J. M. Wetherill, Pres.; J. Dummheller, Vice-Pres.; Major H. S. Thompson, Sec'y and Treas.

WHEN ARE QUAIL PROPERLY "IN SEASON?"—It is a strange inconsistency in the game laws which permits us to shoot quail in Delaware until Feb. 15th, while in the adjoining State of Pennsylvania we are prohibited after Dec. 15th. In Maryland the close season begins Feb. 1st.

## THE COUNTRY.

A weekly journal of sixteen pages, devoted to the Kennel, Shooting, Fishing, Fox Hunting, Archery and other outdoor sports. Has also departments treating of Natural History, The Garden and Poultry, Pigeons and Pets. Edited by Wm. M. Tileston, late associate editor of FOREST AND STREAM. Subscription price, \$3 per year. Specimen copies free. Address, "THE COUNTRY PUBLISHING ASS'N," 33 Murray street, New York.—[Ado.]

## The Rifle.

## TEAM SHOOTING.

FOR THE "FOREST AND STREAM AND ROD AND GUN" MEDAL.

Under the following conditions this journal proposes presenting to the best team, members to belong to some regularly organized association, a gold medal:

Shooting to take place January 23, 1878, at Union Hill Schutzen Park.

## RULES AND REGULATIONS.

Each team to consist of twelve men; ten shots per man. Shooting, off-hand; distance, 200 yards, any rifle; open to all clubs or associations.

No person allowed to compete in a team unless he is an active member of the club for ninety days.

Practice from 10 A. M. to 1 P. M.

Team shooting to commence at 1 P. M. Targets to be drawn for by each captain of each team.

Entrance fee, \$6 for each team.

Ring targets to be used, three-quarter inch rings.

After deducting the expenses for the markers, the balance will be divided to the second and third highest teams.

Shooting to be governed by the Schutzen Bund rules.

All teams can enter for the competition at the FOREST AND STREAM AND ROD AND GUN office, 111 Fulton street, city, on or before January 20, 1878.

Captains of teams entered will constitute the committee.

We are pleased to state that the following teams will participate in the match for the FOREST AND STREAM AND ROD AND GUN gold medal: A team from the Jersey Schutzen Corps, one from the New York Schutzen Corps, one from the Independent New York Schutzen Corps, and the team of the Zettler Rifle Club. It is likely that from six to eight teams will compete. Mr. John Raschen has kindly consented to act as shooting master.

## SIXTH ANNUAL REPORT OF THE NATIONAL RIFLE ASSOCIATION OF AMERICA.

NEW YORK, January 8, 1878.

Mr. President and Gentlemen of the National Rifle Association:

The sixth annual report of the Secretary embraces the year 1877.

The reorganization of the Board of Directors took place at a special meeting of the Board, held Tuesday, January 9, 1877, immediately after the adjournment of the fifth annual meeting of the association, with the following gentlemen as members:

Messrs. Stanton, Wingate, John Ward, Judd, Fulton, Sanford, McMahon, Beebe, Story, Casey, Holland, Scott, Gildersleeve and Schermerhorn, together with Gens. Townsend, Woodward, Knox, Shaler, Dakin, Carr and Husted as ex-officio members.

The result of the balloting for officers and members of the Executive Committee was as follows:

Mr. N. P. Stanton elected President, vice Gen. Shaler; Col. G. W. Wingate elected Vice-President, vice Gen. Woodward; Mr. G. S. Schermerhorn, Jr., re-elected Secretary; Gen. D. D. Wylie, elected Treasurer, vice Gen. McMahon; Gens. Shaler and Dakin, and Col. Gildersleeve were elected to serve with the officers as members of the Executive Committee.

At the regular meeting of the Board of Directors, held February 6, 1877, Gen. D. D. Wylie having been appointed Commissary General and Chief of Ordnance of the State of New York, vice Gen. K. Knox, thus becoming a director ex-officio, resigned his directorship by election, and nominated Gen. W. G. Ward to the vacancy thus created, who was unanimously elected.

The directors retiring January, 1878, by reason of expiration of term, are Mr. D. W. Judd, Major Hy. Fulton, Lieut.-Col. E. H. Sanford, Gen. M. T. McMahon (resigned October 2, 1877), Col. John Ward, who was elected January, 1876, for two years to fill vacancy, and Gen. W. G. Ward elected as previously stated, to fill vacancy for the year. There are, therefore, six vacancies to be filled at this time.

During the year past the terms for which the following named gentlemen were elected honorary members expired, viz.:

Mr. James Gordon Bennett, March 3, 1877; Major Arthur B. Leach, October 6, 1877; Col. Hy. G. Shaw, December 1, 1877.

Mr. E. A. Buck, editor of the *Spirit of the Times*, was elected an Honorary Director of the Association for the full term of three years at a meeting of the Board of Directors, held Sept. 6, 1877, in recognition of his munificence in donating \$1,000 in gold as prizes in the *Spirit of the Times* long-range match.

At the first regular meeting of the Board, held February 6, the President announced the Standing Committees for the year as follows:

Executive Committee—N. P. Stanton, President; Col. G. W. Wingate, Vice-President; Geo. S. Schermerhorn, Jr., Secretary; Gen. D. D. Wylie, Treasurer, ex-officio members: Gen. Alex. Shaler, Gen. Thos. S. Dakin, Col. H. A. Gildersleeve, elected.

Range Committee—Col. G. W. Wingate, Chairman; Capt. J. G. Story, Col. Geo. D. Scott.

Finance Committee—Hon. D. W. Judd, Chairman; Lieut.-Col. E. H. Sanford, Gen. W. G. Ward.

And in accordance with a resolution adopted at this meeting—

Prize Committee—Col. J. Ward, Chairman; Capt. W. C. Casey, Major Jos. Holland.

There have been forty-seven new life members during the past year, of whom forty-one have paid the usual fee, four had the position conferred by vote of the Board without expense to them, and two were offered and won as prizes during the late fall meeting.

A falling off is to be noted in the number of annual mem-

bers, owing possibly to increased facilities offered to members of the National Guard by contract with the State authorities.

Sixteen of the silver life membership badges have been issued during the year, and one duplicate (No. 7), making seventeen in all. The numbers running from fifty-five to seventy, both inclusive.

Twelve rifle clubs or associations have affiliated for the year, including two military organizations affiliated at half membership rates; these are as follows:

Seventh Regiment Rifle Club, New York City; California Rifle Association, San Francisco, Cal.; Massachusetts Rifle Association, Boston, Mass.; Amateur Rifle Club, New York City; Amateur Rifle Club, Rochester, N. Y.; Crescent City Rifle Club, New Orleans, La.; Columbia Long Range Rifle Association, Washington, D. C.; N. Y. Stock Exchange Rifle Club, New York City; Partisan Rifle Club, Hudson, N. Y.; Hackensack Rifle Association, Hackensack, N. J.; Co I Seventh Regiment, N. G. S. N. Y., Washington Grey Troop Cavalry, First Division N. G. S. N. Y., New York City.

And in this connection the hope is expressed that the advantage of having the matches of affiliated local clubs printed upon the monthly programmes of the Association will be more fully appreciated by such clubs, especially those connected with the military organizations of the First and Second Divisions, and lead them to follow the example of those mentioned above. Five States and the District of Columbia are represented.

The monthly or special matches have been as follows:

*Spirit of the Times* badge, No. 1. Three competitions—May 19, June 16 and July 14, being finally won upon this latter date by Lieut.-Col. E. H. Sanford.

*Spirit of the Times* badge No. 2. Two competitions, Oct. 20 and Nov. 17.

*Turf, Field and Farm* challenge badge, No. 2. Six competitions, viz.: June 30, July 28, August 25, September 29, October 20 and November 17.

Marksmen's Badge, presented by Mr. Poppenhusen. Two competitions, May 5 and June 6, finally won by Private A. B. Van Heusen, Twelfth Regiment, N. G. S. N. Y.

Marksmen's Champion Badge, presented by Col. G. W. Wingate. Four competitions, Sept. 29, Oct. 13, Oct. 31, and Nov. 10, finally won by Private Wm. Robertson, Seventy-first Regiment, N. G. S. N. Y.

Wylie Badge. Three competitions, August 1, Oct. 17, Nov. 3.

Skirmishers' Badge. Two competitions, Oct. 27 and Nov. 14.

Winchester Company Match. Two competitions, May 12 and June 23, finally won by Capt. J. E. Stetson, of New Haven, Conn.

Winchester Rifle Match. Two competitions, Oct. 27 and Nov. 14.

Parker Gun Match. Six competitions, May 10, June 30, July 31, Aug. 18, Oct. 13, and Nov. 10, when it was finally won by Mr. C. E. Blydenburgh.

Ballard Mid-Range Rifle Match. Five competitions, June 20, July 11, Aug. 15, Oct. 10 and Nov. 7.

Sharps Rifle Company Prize, \$350 gold. Five competitions were shot during the year, viz.: May 5, June 9, July 14, Aug. 4 and Oct. 6. It was also placed upon the programme for November, but failed to obtain the ten entries as required by the conditions. According to the conditions of this match one-quarter of the entrance money received at each competition is to be added to the principal sum, and these several amounts were: First competition, Oct. 23, 1876, \$4.25; second competition, Nov. 11, 1876, \$3.75; third competition, May 5, 1877, \$3.50; fourth competition, June 9, 1877, \$4.75; fifth competition, July 14, 1877, \$5; sixth competition, Aug. 4, 1877, \$3.50; seventh competition, Oct. 6, 1877, \$2.75; total (currency), \$27.50.

Remington Prize, \$300 gold. Only three competitions were shot during the year for this prize, April 14, May 19 and June 23, although it has been announced regularly upon each monthly programme, having failed to obtain on each occasion the required ten entries to fill. Perhaps some modifications of the conditions might be agreed upon by all those interested which would make the competitions for this prize more attractive. It is probably a matter of regret to many that what was understood to be the purpose of the parties who offered this prize, namely, the obtaining of a record of the average results likely to be produced by the use of the rifle and ammunition as furnished from the manufactory, and while it may be conceded that the experienced rifleman will obtain with ammunition prepared by himself a better result, still it would be welcome information to many to feel that they need not debar themselves from a match or practice day should it come upon them unprepared with their own ammunition; but that the worst that they would have to anticipate would be a difference which they could be prepared to submit to rather than let pass an unexpected opportunity to indulge in their favorite pastime.

It is respectfully suggested that the Association should make application for the amounts of these capital prize that it may have them in its own possession, particularly as they may not be won for a long time to come.

The average entries have exceeded those of last year, and reference is made to the tabulated statements presented herewith for the detailed scores in each competition.

The number of special match competitions shot during the year is largely in excess of any previous one, owing to the fact that some matches were shot twice in one month, and the introduction of the plan of making Wednesdays as well as Saturdays match days, and also to the announcement of two and sometimes three matches for the same day. But two protests of any importance have been made during the year, certainly a creditable circumstance to all concerned.

A new feature this year at our fall meeting was the Inter-State Long Range Match. The introduction of this match is due to Gen. J. B. Woodward, who early in the year suggested it in connection with the announcement of the additional interest excited in the Inter-State Military Match by the circular issued to the Adjutant-Generals of the different States by Gen. Townsend, Adjutant-General, New York. These Inter-State Matches, as a consequence of the success attending them this year, have assumed an importance hardly surpassed by the great International Match. The terms of the Inter-State Long Range Match require that all associations or clubs which may desire to enter the competition must affiliate with the National Rifle Association. As a consequence of this provision there was an addition to our roll of affiliated organizations, in one or two instances as late as time of making entry for the match. It is the opinion of many of our members that in this Inter-State Match but one team should be permitted to represent a single State, such team to be selected in the manner agreed upon by the riflemen of such State among themselves. The consideration of the subject is respectfully recommended.

In all, during the year just past, there have been 69 matches

shot at Creedmoor under the auspices of the association, as follows:

Spring Meeting, 3, including Leech Cup Match, under auspices of Amateur Rifle Club; Fall meeting, 15; monthly matches, 46.

Attention is called to the following list of donors of prizes for the year 1877:

Mr. J. H. Steward, optician to the Ass'n, London, barometer, field glass and telescope; J. F. McHugh, tent; The Commander-in-Chief S. N. Y., trophy, value \$500; Messrs. Tiffany & Co., silver vase; H. H. R. S. N. Y., two trophies, value each \$100; Messrs. E. Remington & Sons, Creedmoor rifle; Winchester Arms Co., three rifles; Mr. E. A. Buck, editor *Spirit of the Times*, cash (gold) \$1,000; Messrs. J. O. Moore's Sons, revolver; Mr. Homer Fisher, ammunition case; *Spirit of the Times*, gold badge, No. 2; *Turf, Field and Farm*, gold badge, No. 2; Messrs. Schoverling & Daly, Ballard rifle; Mr. F. B. Van Sien, Parker shot-gun; Col. G. W. Wingate, Champion Marksmen's gold badge; Winchester repeating rifle; Gen. Hiram Harvey, "Skirmishers'" gold badge; Gen. D. D. Wylie, Wylie gold badge.

At a meeting of the Board of Directors, held Feb. 6th, on motion of Capt. J. G. Story a resolution was adopted to the effect that the Treasurer be requested to call upon the officials of the Long Island R. R. Co. in reference to price of railroad tickets to Creedmoor, and also to endeavor to obtain increased facilities for the purchase of tickets by our members by the R. R. Co. permitting their sale at the office of the Association. In accordance with this resolution, Gen. Wylie, the Treasurer, called upon the proper parties and effected such arrangements as enabled him to procure tickets for sale to our members and the National Guard in packages of five "round trip" tickets for \$1.75, thus reducing the cost of excursion tickets to Creedmoor from 50 to 35 cents. These tickets have been kept on sale at the office of the Association, very much to the satisfaction of the members.

At the regular meeting of the Board of Directors, held April 3d, the Range Committee reported that the contract with the State had been made upon the following terms: The Association to furnish twenty targets and markers for three days in each week for the use of the National Guard, and the State to pay \$4,500 in consideration thereof.

Early in the year the President called attention to the fact that the Association was not possessed of a corporate seal, and a committee was appointed to procure designs and estimates of cost, and upon a final report made at the meeting of the Board of Directors on the 8th September, the present seal of the Association was adopted. Having regard for the interest attached to everything connected with the great International Match, the Secretary has thought it judicious to prepare a separate report, as last year, upon that subject, and attention is respectfully called to the same.

At one of the first meetings of the Board for the year a committee was appointed to prepare suitable resolutions of acknowledgment to be presented to Gen. J. B. Woodward, Ex-Vice-President, for valuable services rendered by him in various capacities to the Association since its organization. At Gen. Woodward's express desire this was to be done without expense to the Association, and at the meeting of the Board of Directors, held December 10th, this committee reported to the Board a copy of the resolutions prepared by them, and that day presented to Gen. Woodward, together with the speech of the Chairman upon the occasion, which the Board accepted and ordered to be printed in the next Annual Report of the Association. For this purpose they are presented, as follows:

General Woodward—You will remember that shortly after you retired from the office of Vice-President, the directors expressed a desire to convey to you in some appropriate manner their appreciation of your services to the Association from the date of its organization. In pursuance of that desire they appointed a committee, which I have the honor to now represent, to draft and present to you suitable resolutions. The committee could not hope to more than partially express in the resolutions the obligations which the riflemen of America, as well as your associate directors, were under to you for the aid you contributed in giving character and permanence to this favorite amusement; and we trust that your estimate of our personal esteem will not be measured by so imperfect a standard as these resolutions furnish; but, such as they are, we present them to you with the hope that, while they fail to express our sentiments as fully as we might wish, you will receive them and give them a place in your home, where your family and friends may, in time to come as well as the present, learn by them that your associates were not entirely unmindful of the services you rendered in permanently establishing rifle-shooting in America. And if their personal shall be the means, in the slightest degree, of encouraging others in the exercise of those noble qualities of honesty and uprightness, which have been, and are, so conspicuous in your character; or if, in after years, you shall find in them a reminder of pleasant associations, then this testimonial shall not have been prepared in vain. Mr. President and gentlemen, your committee propose the health of Gen. John B. Woodward. May he long live to enjoy the respect, the esteem and the love of friends no less true than those which now surround him.

*Board of Directors National Rifle Association:*

Gentlemen—The committee appointed to draft resolutions expressing the thanks of the directors to Major-General John B. Woodward for the services rendered by him to the National Rifle Association, beg leave to report that they have artistically engraved and presented to General Woodward the following, without exp. use to the Association:

Whereas, Major-General John B. Woodward was one of the incorporators of the National Rifle Association, and has since the date of its organization been an active and valuable official therein, filling, with honor and credit to himself and with great benefit to the Association, the responsible offices of Treasurer, Vice-President, Chairman of the Finance and Range Committees, and Chief Executive Officer at important Prize Meetings; and

Whereas, in the discharge of the varied and arduous duties of the positions above named, and in his intercourse with the officers and members of the Association, General Woodward has constantly exhibited the rare qualities of a zealous, competent and faithful official, combined with a courteous and gentlemanly demeanor toward all; and

Whereas, General Woodward has, by the energy and ability displayed in rendering his voluntary services, greatly encouraged the introduction of rifle-shooting as a popular and gentleman-like out-door pastime among the American people, and by his active co-operation contributed to the permanent establishment of the National Rifle Association of America; now, therefore,

Resolved, That, in recognition of the valuable services rendered by Major-General John B. Woodward to the National Rifle Association in carrying out its objects and in promoting its interests, the Directors, both officially and individually, take great pleasure in conveying to him their sincere and grateful thanks.

New York, October, 1877.

The committee, having performed the duties assigned it, respectfully ask to be discharged.

ALEXANDER SNAPE,  
HENRY FULTON,  
H. A. GILBERTSLEEVE.

The Secretary begs respectfully to submit the following recommendations:

First—In view of the fact that the "Regulations" as issued during the last summer were necessarily somewhat hastily prepared, and that there are several typographical errors; and

the further fact, that these regulations are largely taken up with matter which refers only to our annual meetings; and the still further fact, that these regulations are the rule and standard by which rifle practice is governed to so large and increasing a degree throughout the entire Union—it is recommended that a committee be appointed at an early day to prepare a revised edition, which shall separate what refers exclusively to the meetings from general rules applicable to all matches, and submit the same to the Board of Directors for their approval, that upon adoption they may be put in print early in the year and be distributed before the opening of the next season.

Second—The records of the Association and many of the books in the office are of great value to it, and their loss would be irreparable, and the purchase of a suitable safe is therefore recommended; and if the books of the Treasurer were also kept there, as they should be, that the office of the Association may be really its headquarters and the different officers required to fix stated hours, two or three in each week, when they might be found at the office, it would be vastly to the benefit of the Association. And here it may be well to suggest that no purchases of any description should be made by any party without filing at the time a duplicate order in a book to be kept for the purpose at the office. Purchases of supplies, etc., are now made and the bills are ordered sent to the office, entered in a book, and when the monthly meeting of the Board approaches they are certified to by the Range Committee, and it then becomes the duty of the Secretary to present them to the Board, who audit and pass to Treasurer for payment. Of course at the office there is no means of knowing whether two similar bills are duplicates or not from the mere fact that they bear even date, and in some cases mere statements of bills previously rendered have been thus audited and in one case a triplicate bill was only accidentally discovered from some peculiarity by the Asst. Secy.

Third—The Secretary asks respectfully to join the Executive Officer of the late Fall Meeting in some of the recommendations made by him in his report submitted at a recent meeting of the Board of Directors, and which is to be printed in the Annual Report of the Association: especially that of fixing the number of shots in all military matches hereafter to seven, and omitting entirely sighting shots in all matches at the same annual meetings; the permitting in many matches of the same person entering as many times as he may desire; the assignment to targets and fixing of day and hour at the time of entry, upon the Wimbledon plan; and the closing of the books for regular entries at least one week before the opening day of the meeting; and the making of all entries after that time *post entries*, would enable the Association to provide many additional matches by accommodating a much larger number of entries in one day.

Fourth—It is earnestly recommended that a proper certificate of life membership should be adopted, as it does not appear creditable to the dignity of the Association that the present system of issuing temporary certificates should be continued. It is not necessary that either an elaborate or costly design should be selected. It may be stated, in fact, from inquiries made, that \$50 would provide a suitably engraved plate and the first hundred certificates.

At a meeting of the Board of Directors, held June 26, the President was directed to take the necessary legal steps to have the name of the association changed to the "National Rifle Association of America," and at the meeting of the board on Oct. 2 the President announced the receipt of the order of the Supreme Court to that effect. At the same meeting (Oct. 2) resolutions were adopted creating the office of "Official Surgeon to the Association," and appointing Surgeon Moreau Morris to the position.

The several reports of Treasurer, Range and Finance Committees, chief-executive officer and statistical officer of the fifth annual prize meeting, and presented at this time, are very complete, and will repay careful examination, as furnishing in detail much valuable information concerning the affairs of the association for the past year.

The *Volunteer Service Gazette*, of London, has been added to the list of papers regularly received and filed at the office of the Association during the year 1877, and the Secretary takes this opportunity of expressing the obligations of the Association to the editors of the following papers, all of which have been regularly and promptly received, viz.: *FOREST AND STREAM* AND *KOD AND GUN*, *Army and Navy Journal*, *Spirit of the Times*, *Turf, Field and Farm*, *Chicago Field*, and the *Volunteer Service Gazette*, of London.

Very respectfully submitted,  
Geo. S. SOHMERMEHORN, JR., Secretary.

THE NATIONAL RIFLE ASSOCIATION.—A meeting of the Board of Directors of the National Rifle Association was held Jan. 2. Judge Stanton, the President, in the chair. The report of the Treasurer showed the receipts of the past month to have been \$428.82; disbursements, \$412.49; balance on hand, \$26.33. Col. Wingate reported that the Superintendent of the range at Creedmoor had repaired the woodwork in the markers' built, in such a manner as to preclude the necessity of further repairs during the coming year. The Range Committee, he said, was also in favor of retaining the present Superintendent, W. H. Brower, as being perfectly fitted for the position. The Committee on By-Laws reported certain amendments to the code of by-laws governing the association. The following officers were constituted Honorary Directors, ex-officio, in addition to those provided for in the old by-laws: The General commanding the Army, the United States Department Commanders, the Superintendent at West Point, Chief of Ordnance of the United States, Adjutant-Generals of the several States and Territories, and the Presidents of the State Rifle Associations who have affiliated. These Honorary Directors will be allowed a voice in all matters relating to the association, but will only be entitled to vote upon the general rules of the association in relation to rifle practice, and all international or inter-State rifle matches. Other important changes were as follows: After a member has paid annual dues (\$3) for ten years he shall be constituted a life member, and any member of an affiliating club who lives more than 100 miles from Creedmoor shall be entitled to all the privileges of annual members on the range. The amendments were adopted as a whole, and will now come before the entire National Rifle Association at its next annual meeting for their adoption as a whole. A communication was received from Mr. Thomas E. Lamb, Jr., of the late American team, announcing that he had not received the sum of \$200, due to him according to a resolution passed by the association returning that amount to each member of the team for his expenses. On motion the Treasurer was directed to pay Mr. Lamb the amount asked for.

## BOAT AND YACHT BUILDING.

BY NAUTICUS.

A SPORTSMAN'S CANOE.

The drawings represented by diagrams No. 34, 35 and 36 are for a boat of all work, either ducking, fishing, or travel. The dimensions of the canoe are thirteen feet long, thirty inches wide and nine inches deep at midships. With the sheer represented on the drawings, the stem and stern would be one foot deep. If thought

quarter or three-eighths of an inch thick. If quarter-inch planking is used, the ribs should not be more than four inches apart. Ribs—for three-eighths planking—may be placed from six to eight inches apart. The ribs may be from three-eighths to one-half inch thick; keel, seven-eighths to one inch thick; stem and stern, deadwood, of a corresponding size. The rails are three-fourths of an inch thick and one and one-half inch deep. Diagram No. 37 represents the manner in which the deck beams are joined to the rails. The deck beams are one-half inch thick and have a rise of three inches. If more sheer is given to the boat than is represented in the diagram, the rise of deck is increased in like amount. Curved deck beams may be used if preferred. Two boards—one-half inch thick—are nailed to the ridge or deck beams, and canvas stretched over all and fastened with tacks. The length of cockpit may be about five feet; wash-boards on side of cockpit, four inches wide, supported by knees; combing projects one and one-half inch above deck. The deck may be constructed as described in the article on the Skip-jack Canoe. Outriggers for rowing are fitted in such a manner as to be readily removed. Paddles for ducking, about three feet long; for cruising, seven and one-half or eight feet long. With the aid of a few supplementary suggestions, the reader will be in possession of all that

large loads, or is to be used in very shallow waters, the midship section should be similar to that of the sportsman's canoe; if only designed for light rowing, a midship section of less area is desirable. The proportions of ribs, planking, etc., depend as much on the service required as on the size of the boat. A ship-boat, twenty-four feet long and six feet beam, has ribs about one and one-half inch thick; frame in propor-

Diagram No. 36.

tion; planking, seven-eighths or one inch thick; ribs placed ten or twelve inches apart. A North River shad fisher's boat is from eighteen to twenty feet long, five and one-half to six feet beam, and three to three and one-half feet wide at the stern; depth at midships, eighteen inches; at bow, twenty-seven inches; at stern, thirty inches; planking, five-eighths or three-fourths of an inch thick. As these boats carry heavy loads on the stern, the water lines are made very full aft. There are many other methods of construction besides the one already described. In diagonal planking, one end of the planking is fastened to the keel, the other bent up in a diagonal direction to the rail, and there fastened. The planks are fitted close to one another and bent over frames made to give the desired shape.

After one course of planking is completed, another course is laid over it, crossing the first course at right angles. The two courses of planking are firmly riveted together and no ribs are used. Double planked boats—without ribs—are also made by running the planking fore and aft as usual, lapping the planks of the second course on those of the first, and riveting all together. Boats are made of paper, and there are many different ways of combining wood and canvas; but the "original Jacobs"—fore and aft planking on good oak frames—is the very best method yet devised to make a serviceable and lasting boat. There are many objections to the use of metal for small boats, and it will never be popular except for large craft.

COMMODORE VOORHIS, OF THE BROOKLYN YACHT CLUB.—We regret to announce the death of Jacob Voorhis, Jr., Esq. Mr. Voorhis joined the New York Yacht Club in 1868, and later became a prominent member of the Brooklyn Yacht Club. In 1872 he was elected Commodore of the Brooklyn Club, which office he held until 1876. During his management all the details of the club were wisely and carefully carried out. Lately, with declining health, Mr. Voorhis had been spending a portion of the year in the South. The late Commodore was well known as the owner of the schooner Madeline, which vessel was selected as the champion of the N. Y. Yacht Club in the last contest for the America cup. Originally the Madeline was built as a sloop; she was rebuilt by Mr. Voorhis, until as a schooner she became so conspicuous for her victories as to win the proud title of Queen of the Fleet. Mr. Voorhis, from his genial character and high sense of honor, was respected and esteemed by all who knew him.

THE FLORIDA YACHT CLUB.—The yachting season for the winter was most auspiciously opened last week by a ball given by the members of the club to their friends in the newly completed Yacht Club House, which is a handsome structure of Swiss architecture. The Florida Club, whose organization and work have been recorded in former numbers of FOREST AND STREAM, is composed of the citizens of Jacksonville and gentlemen visitors who make that city their winter headquarters. Besides affording pleasure to residents and members, the doors of its new club house are always open for the entertainment of strangers properly recommended, who

may enjoy all its privileges upon the payment of a small fee for the season. The officers for the ensuing year are: Com. William Astor; Vice-Com., Chas. J. Kenworthy; Captain, Mellen W. Drow.

MESSRS. TIFFANY & CO., UNION SQUARE, NEW YORK City, have made extensive preparations for the approaching HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

advisable, two or three inches more sheer may be given. The design may be lengthened by placing the cross sections further apart, making the canoe fourteen or fifteen feet long. The drawings give one-half the length of the boat, both ends being precisely alike. The general construction of the boat is the same as the row-boat, already described. Planking, cedar, one-

is necessary to enable him to design row-boats for any required service. The proportion of depth of hold at midships to length, for ordinary row-boats, is one-twelfth or one inch in depth to each foot in length. The proportion of width to length varies from one-fourth to one-sixth. Boats to be used in rough water require more sheer than others, unless they are decked at the bow, when it is a matter of indifference. The shape of the midship section is a matter of importance. If the boat is designed to carry

GUNPOWDER.

## Hazard's "Electric Powder."

No. 1 (fine) to 6 (coarse). Unsurpassed in point of  
strength and cleanliness. Packed in square canis-  
ters of 1 lb. only.

## Hazard's "American Sporting."

No. 1 (fine) to 6 (coarse). In 1 lb. canisters and  
6½ lb. kegs. A fine grain, quick and clean, for  
upland prairie shooting. Well adapted to shot-  
guns.

## Hazard's "Duck Shooting."

No. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters  
and 6½ and 12½ lb. kegs. Burns slowly and very  
clean, shooting remarkably close and with great  
penetration. For field, forest or water shooting, it  
ranks any other brand, and it is equally serviceable  
for muzzle or breech-loaders.

## Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25,  
12½ and 6½ lbs. and cans of 5 lbs. FFG is also  
packed in 1 and ½ lb. canisters. Burns strong and  
moist. The FFG and FFG are favorite brands for  
ordinary sporting, and the "Sea Shooting" FG is  
the standard rifle powder of the country.

## Sportsmen's Goods.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON, MASS.

## THE BEST IN USE.

ONLY ONE QUALITY MADE AND THAT IS THE  
VERY BEST.

Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat  
—has the name and manufacturers' address  
stamped upon it, and no suit is genuine with-  
out it bears this imprint.

The suit can be sent, securely packed, by  
mail to any part of the United States or Cana-  
da on receipt of \$1.25 above the price of  
the suit.

We make no discount except to the trade.  
The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and  
choice of either cap with havelock, or hat.

The material is of the best quality of duck,  
waterproofed by a patent process. The color  
is that known as "dead grass shade."

The seams and pocket corners are copper  
riveted, and nothing is neglected to make  
the whole suit complete in every way.

This is what one of our best sportsmen says  
of it, writing from camp: "Miserable, drench-  
ing rain, pouring down in a perfect deluge,  
as if a second flood had come upon the earth,  
two portages to cross, and a swamp between  
them; that was the prospect before we reached  
our camping ground. Such a swamp, too;  
almost impassable, for where the ground was  
firm was an almost impenetrable thicket of  
thorns and what not, that looked as if it would  
tear you to pieces. Well, we got to our  
camp, and I must confess I was agreeably sur-  
prised on my arrival. Although I had been  
nearly eight hours under incessant rain, labor-  
ing and striving along under the adverse cir-  
cumstances above mentioned, yet I found  
myself comparatively dry, and my clothes  
without a tear. For the benefit of our brother-  
sportsmen, let me advise one of Messrs. Sim-  
mons' (of Boston, Mass.) Waterproof Suits.  
Oh! what a relief it was to find one's tobacco  
was dry, and that one could light a pipe; that  
you could laugh at your miserable friend,  
who stood shivering and shaking as if he  
had the palsy; and then, next morning, oh!  
what fun it was to see him mending his  
clothes, while I had not a tear to complain of.  
Ventilation, also, that great bugbear of water-  
proof suits, is legislated for in the most inge-  
nious manner. No sportsman should fail to  
supply himself with a suit which is at once  
cheap, practical, and will last an almost indef-  
inite time."

## Our Leather Jackets and Vests

are the great wind protectors. They are made  
from soft, pliable black leather, flannel lined,  
and sell at \$9 and \$7.

Our Flexible Tan-Colored  
Waterproof Leather Coats  
and Breeches

are considered the finest things ever made.  
They sell at \$23 and \$15.

An illustrated circular, containing full de-  
scription of each garment, with sample of the  
material from which made, will be sent free  
on application.

Hart's Sportsman's Favorite Metallic Shells.  
FOR BREACH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside.  
Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents  
it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fast-  
ened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel  
Cone also prevents miss-fires when a cap has been left on shell for a few days, which is liable to occur either  
in steel or iron. These Shells are finely finished, and made any length ordered, from 2½ to 3½ inches.  
Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses  
throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.  
MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better  
than any I have ever used. They are stronger and better in every respect, and I shall use them in all my  
shooting hereafter.  
Yours truly,  
A. H. BOGARDUS.

A VICTORIOUS INVENTION  
The Eagle Claw.

An ingenious device for the purpose of catching all kinds of  
Animals, Fish and Game.  
The easy method of setting the Eagle Claw, combined with  
the simplicity of removing the victim, are among its peculiar  
advantages.

It is immaterial how to place it when set. It may be buried  
flat in the ground, suspended from the limb of a tree, or when  
occasion requires, covered with grass, leaves or other light  
material without in any way impairing its certain operation.  
It is adapted for bait of any description, and, when set, no  
Animal, Fish or Bird that touches the bait can possibly escape.  
It does not mangle or injure its victims in the slightest  
degree, nor need they be handled to free them from the trap.

## PRICE LIST.

No. 1—For fishing and all kinds of small game and animals,  
sent by mail.....35 cents.  
No. 2—For catching Mink, Muskrats, Raccoons, large Game,  
Fish, etc.....50 cents.  
No. 3, or Rocky Mountain Giant, for catching Bears, Wolves,  
Panthers, etc. Can be easily set by a boy, and will stand a  
strain of several hundred pounds. Weight, 10 to 15 lbs. \$10.  
All goods sent, charges paid, to any address on receipt of  
price. Address

## SHONINGER ORGANS.

PRONOUNCED UNANIMOUSLY AS THE

## Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The H. SHONINGER ORGAN CO.'s exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Boas, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.

New styles and prices just issued, which are in accordance with our rule, the BEST ORGANS for the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to

B. SHONINGER ORGAN CO.,

97 to 123 Chestnut Street,

Nov5

## THE

## CHOKE-BORE MATCH.

W. W. GREENER begs to inform his numerous patrons in America that his gun has again come off victorious at the great match of Choke-Bore vs. Cylinder Bore, at the London Gun Club, on May 23, beating seventeen of the best shots in Great Britain who used guns by the best London makers, viz.: Four made by Grant, three by Purdy, three by Douglas, one by Lancaster, Boss and others.

[See London Field, May 26, Editorial Remarks.]

"Mr. Cholmondeley Pennell, the winner of Mr. Purdy's massive fifty guinea cup, weighing over 91 lbs., for the highest score, shot wonderfully well, killing all his birds at 30 yards with the first barrel. The gun he used was a fall choke, by Greener, of Birmingham. The result of the trial served to show the superiority of the choke at the long range. Mr. C. Pennell cutting down his birds in a marvellous way with his heavy Greener."

## W. W. GREENER,

St. Mary's Works, Birmingham, and 63 Haymarket, London.

Read "Choke-Bore Guns and How to Load," by Cassell, Peiter &amp; Galpin, New York.

## GOOD'S OIL TANNED MOCCASINS.

The best thing in the market for hunting, fishing, canoeing, snow-shoeing, etc. They are easy to the feet, and very durable. Made to order in a variety of styles, and warranted the genuine article. Send for illustrated circular. MARTIN S. HUTCHINGS, P. O. Box 363, Dover, N. H. (Successor to Frank Good.)

W. HOLBERTON, 102 Nassau St., N. Y., Agent.

SEND FOR NEW CIRCULAR.

W. H. BAKER &amp; CO., Syracuse, New York.

## IRA A. PAINE'S CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

They will eventually be the Standard Ball. Out of One Million already sold, not one complaint. No Fancy Price, but a fair profit. Every ball is warranted to give satisfaction. The number of orders from all parts of the country speak volumes.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 200.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

## PAINE'S PATENT Feather-Filled Glass Balls and Huber Traps.

MESSRS. WILLIAMS & POWELL HAVE ORDERED 30,000 OF THE FORMER, AND FORTY OF THE LATTER. THEY WILL BE SHIPPED FOR ENGLAND ON SATURDAY NEXT. THIS, WITH THE LATE ORDER FROM W. & C. SCOTT & SONS, EFFECTUALLY ESTABLISHES THE SUPERIORITY OF THE

## PAINE FILLED BALLS AND THE HUBER TRAPS.

Dec13 1m

## Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8.

W. &amp; C. SCOTT &amp; SONS have ordered 10,000 balls and 24 traps to be sent to England.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE "FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen. It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and lures for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 227 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador" of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

#### THE JOYS OF THE FIELD.

Selected.

THEY sing of the dashing dragoon,  
The soldier so gallant to see,  
Of jolly Jack Tar in his uniform blue,  
But the life of the hunter for me.  
His jacket of canvas so trim,  
His step so elastic and free,  
With gun on his shoulder and dogs by his side;—  
The joys of the field for me.

With pockets all over his coat,  
Each furnished with provident skill;  
A bold joyous eye and a confident heart,  
He's sportsman or soldier at will.  
Then "hie boys! go on!" is the word,  
It quickens the pulses to see  
His trusty companions in eager career;—  
The joys of the field for me.

Ho! steady! he has them! old Staunch;  
How rigid the pup backs his sire;  
Head up and half turned, with a *whirr* up they spring,  
Now! right and left give them your fire;  
A double and odd to the score.  
"Down, charge," load and gather the three,  
Then, on to the covert with footsteps alert;—  
The joys of the field for me.

And when the sun sinks in the west,  
With purple and gold all aflame,  
The sportsman exults in the glorious scene,  
But most he exults in his game.  
With pockets well filled for his toll,  
And step still elastic and free,  
He trolls a stout ditty and marches for home;—  
The joys of the field for me.

Behold, at the bountiful board,  
St. Hubert, what havoc he makes;  
Charging gallantly into a phalanx of meats,  
And scaling a tower of cakes!  
Then a pipe, and perhaps something hot  
Before bed, is the thing, don't you see,  
With slumbers far sweeter than poppies can bring;—  
The joys of the field for me.

Ye Sybarites, worshipping ease,  
Who droop at the scent of a rose;  
How little ye reck what a treasure of joy  
Old Pan on the sportsman bestows.  
From the clusters the rarest we'll press,  
Libations, Great Patron, to thee!  
Success to the sportsman and health to his dogs;—  
The joys of the field for me.

—Germantown Telegraph.

For Forest and Stream and Rod and Gun.

#### Voyaging on the Upper Missouri.

By ERNEST INGERSOLL.  
NO. II.

ORIGIN OF THE NORTHWESTERN FUR TRADE—FORT BENTON—  
SYSTEM OF TRADING—BATTLES WITH THE BLACKFEET—AN-  
ECDOTES OF THE VOYAGEURS—PROSPERITY OF THE MODERN  
TOWN.

THIRTY-FIVE miles below the Falls of the Missouri stands Fort Benton, the *ultima thule* of my boyish imagination—a spot containing more adventurous romance, I thought, than any other place on the globe. And it is pleasant to add that, when unexpectedly I found myself at this Mecca of my Northwestern pilgrimage, I was not more disappointed than my later experience had prepared me for.

When, in 1642, Charles II. granted to the "Hudson's Bay Fur Company" a monopoly of the fur trade of all North America, he set up a monarchy on this continent far more powerful in actual arbitrary control of its subjects than was his own rule in England, and one which was sure to engender rivalry and opposition, even though it was 200 years in rising. The operations of this company were chiefly confined to what is now called British America, and, although its traders made excursions southward, it had no posts established on the Missouri. In the early part of the present century the Northwestern Fur Company, consisting of New York and Canadian merchants, was started to trade with the Indians of this region, but was soon replaced by the American Fur Company—as the firm of Pierre Chouteau & Co., of St. Louis, was called—which pushed its trading posts further and fur-

ther up the Missouri. An intense competition, of course, sprang up between the old and the young company, several times leading to bloodshed. Fort Union having been established at the mouth of the Yellowstone in 1829 as a basis of supplies, exploring and trading expeditions were sent up the river, building stockades at various points, mainly of a temporary character, until, in 1846, a very substantial fort was erected by Major Alexander Culbertson on the north bank of the Missouri, at the head of navigation, 667 miles above Fort Union and 2,663 miles from St. Louis by river. The new fort was named in honor of Governor and Senator Thos. H. Benton, of Missouri, who, some years before, had rescued the company from a ruinous litigation.

Fort Benton was 250 feet square, and, except the front, wholly built of sun-dried bricks. The picturesque structure is still standing, although long since disused. The wall of gray adobes are of great thickness, able to resist any mode of attack likely to be brought against them, while at opposite corners two square bastion towers surmount the walls, from which an enfilading fire could be poured upon besiegers. Built against the wall inside are the ware-rooms and the barracks of the score or so of men employed, while the log dwellings and offices of the agents and officers constitute the front of the quadrangle. The roofs of all the buildings are covered with earth as a protection against fire. There is but one entrance—a massive, doubled leaved gate. At one side of this entrance, within the wall, stands the store, and at the other side a warehouse, the inner corners of these buildings being connected by a stockade and second gate similar to the outer portal, enclosing a strong room without any roof. In the side of the store, about five feet from the ground, was a hole eighteen inches square, with a strong shutter-fastening inside. When the Indians wanted to trade, the inner gate was closed; a man would stand at the outer gate until as many Indians as the space between the gates would contain had passed in; then he would lock the outer gate and go through the trading hole into the store. The Indians would then pass whatever articles each one had to trade through the hole and the trader would throw out whatever the Indian wanted, to the value in trade of the article received. When the party were done trading, they were turned out and another party admitted. In that way the Indians were entirely at the mercy of the traders, for they could all be killed through loop-holes in the store. The articles brought by the Indians for trade were buffalo robes, elk, deer, antelope, bear, wolf, beaver, otter, fox, mink, martin, wild-cat, skunk and badger skins. The sale of whiskey had been interdicted by Congress, and for fear of danger to themselves the traders did not sell them guns; but when an Indian proved to be a good hunter and a good friend to the traders by his actions and talk, he could occasionally borrow a gun and a few loads of ammunition to make a hunt. The principal articles of trade were alcohol, blankets, blue and scarlet cloth, sheeting (domestics), ticking, tobacco, knives, fire-steels, arrow points, files, brass wire (different sizes), beads, brass tacks, leather belts (from four to ten inches wide), silver ornaments for hair, shells, axes, hatchets, etc.

The system pursued kept all the subordinate employees of the company in actual bondage. The men were paid only \$200 to \$250 a year, and were charged outrageous prices for the necessities of life. A cup of ammunition, coffee, sugar, flour or lard cost a dollar; an ordinary flannel shirt from ten to twenty dollars, and so on. The men consequently dressed entirely in buckskin, and lived for months together solely on meat without any salt, and little green stuff. Everything (except the flesh and skins of wild animals) had to be brought from Fort Union—and at first from St. Louis—in keel-boats, which, much of the way, it was impossible to row against the current, the only means of progress being by walking along the bank and dragging the boat by a towing-rope held across the shoulder. This was termed "cordelling," and some of the old Frenchmen yet alive point to their bent backs and knotted hands as evidence of the terribly hard work it was. The result was that the laborers were in a perpetual bondage of debt to the company, and their only hope of escape, or chance of "getting ahead," was to run away and roam through the mountains as independent trappers, which many of them did, passing lives of the most startling adventure.

Several trading stations had preceded Fort Benton—one of

which—Fort McKenzie—on the Brule bottoms, a short distance below, had been occupied by Major Culbertson for eleven years, and was the scene of the defeat of the Crow chief, Rotten Belly, whose fame is preserved in the name of a prominent butte and canyon near by.

This celebrated chief, urged on by his people, had previously beleaguered Fort McKenzie, capturing all the animals of the fort. The place was in charge of Mr. Culbertson, and there were but nineteen men to defend it. For a month this little force baffled all the attempts of the crows to get possession. Being, however, in a starving condition, and it being apparent that they could not hold out much longer, resort was had to stratagem. Twenty-nine squaws in the garrison were dressed in men's clothes, and, with arms in their hands, were distributed around the fort in sight of the Crows, who, thus deceived in reference to the force defending the place, became disheartened, drew off and separated. Rotten Belly, with a portion, mortified at his failure, declared he would go north and seek death in battle. On reaching the rocks and seeing the Gros Ventres, he said: "Here I will die to-day; you have brought me to this," and rushing upon his enemies he killed two, and then received his death wound. Before his death he advised his people to be the friends of the whites, saying it was their only chance to escape defeat and utter ruin.

In 1842, the Blackfeet Indians having become troublesome, F. A. Chardon, then in charge of the fort, concluded to punish them. He waited until a trading party came in, and when they were assembled in front of the gate, he suddenly opened it and fired upon them with a small canon loaded with musket balls, afterward killing all the wounded with knives. Thirty were thus massacred. The result was such a determined war by the outraged tribe that the fort had to be abandoned and another (Fort F. A. Chardon) built at the mouth of the Judith River.

Fort Benton was commanded by various officers after Major Culbertson, but none of them is so well remembered as "Old Man Dawson." He was a pompous, dignified, strict man—something of a tyrant, but very well liked on the whole. Many anecdotes are preserved of him. One winter when everybody was nearly starving, an old *voyageur* named Viall killed one of Mr. Dawson's precious pigs and divided it among the garrison. The commandant, finally discovering the thief, ordered the value of the porker to be charged against him. Viall could do nothing but bide his time. Soon after that Dawson had occasion to go to a neighboring post and took Viall with him. On the way his horse stumbled, pitching his rider into a coulee, whence he called Viall to extricate him. The old Frenchman paid no attention, and not until the irate factor's language grew strong did Viall condescend to hear his cries and turn back.

"Want me to help ye, eh?" he sneered. "Wall you scratch ze pig in ze big book?"

"No, I won't," replied the testy factor. So Viall rode off. But soon his struggling chief called him back.

"Oh! Viall, give me a lift."

"Wall ye scratch the pig?" Viall was inexorable.

"No, d— me if I will!" Dawson shouted in boiling wrath, and Viall turned his horse's head again, while the factor floundered in vain, and a third time called the old trapper back.

"Wall ye scratch it now 'f I gi' ye a hand?" he asked cautiously, before dismounting.

"Yes; pull me out."

"And will ye gi' me squaw a new dress?" added Viall.

"Yes—here! take hold!"

"And will ye gi' me a new suit of clothes?"

"Yes, yes—anything—only pull me out of this coulee!"

So Viall rescued his employer, and Dawson kept his promises.

Another story of Viall is as follows:

He was once sent to guide some Catholic priests across the Saskatchewan country. On the way they saw a war party of Indians approaching.

"Come on!" cried Viall instantly, "follow me as hard as you can ride."

"Oh, no," replied the missionaries placidly. "Keep quiet; trust in the Lord, and they won't harm us."

But the old *voyageur* preferred to trust to his horse, and made off at the top of his speed, while the Indians robbed

the Jesuits and set them afoot. Finally, after great toil, the priests reached a trading post and met Vial.

"Well," he said to them, "I heard ye got jumped. When ye've been among ze red devils ez long ez I have, ye'll learn it's a d—d sight better to trust to your heels zan ze Lord in an Injun country."

The fort came to have a permanent importance as the head of steamboat navigation, so that, although little by little the business of the fur companies declined, the old trading-post was not abandoned until 1871. Then it was occupied by United States troops for a time, and since then has been going to dilapidation under the tenantry of half-breed families, who cause its interior to closely resemble a court of Sullivan street tenement-houses. No more do we see Fort Benton a remote, isolated trading post in a broad wilderness wholly possessed by the red savage. Gold has been found in Montana, thousands of stalwart men gather in her gulches, and the vast supplies thus rendered necessary find their way to the mines mainly through the Missouri River. A new and extensive business is created, and under the walls of the old fort a town begins to spring up.

The two firms who have succeeded to the fur and Indian trade of the Northwest both have their headquarters here. They are T. C. Power & Co. and J. G. Baker & Co. The former were post-traders for a year at Fort Sully in 1867. Then they moved their store up here and began to establish out-posts at Cypress Mountain and Forts Walsh and McCloud north of the line, and in Montana at Fort Claggett, Marias River and Fort Shaw, besides a branch office in Helena, and several temporary trading stations. In 1876 they shipped to the East 33,000 buffalo robes, and in 1877, 21,000, all of which were bought from the Indians in exchange for blankets.

They handle half of the freight brought up the Missouri, and dispatch it inland by means of their four trains of mule freight wagons. Each of these trains is probably worth \$12,000, and in addition to this, they are the proprietors of a bonded line from the sea-board, and are interested in the "Benton (steamboat) Transportation Company." Their business amounts to \$350,000 a year. Baker & Co. began in 1866 to trade in competition with the American Fur Company, and by 1871 had out-distanced them completely. Meanwhile they also established various outposts, and united the business of post-traders, forwarders, bankers and contractors to the Mounted Police. They now run five freight trains, carrying from 80,000 to 100,000 pounds each every trip, during eight months of the year, at the rate of about one cent per pound for each hundred miles. They own one steamboat and have an interest in another, all of which, including banking, enables them to do an annual business approaching \$1,000,000. The two firms together control the fur market of the United States, accumulating more peltries than all the rest of the country together.

Pleasantly located in a crescent of bluffs on the banks of the Missouri, there clear and swift, encompassed by the beautiful and fertile valleys of the Sun River, Teton and Marias, whose broad acres, untouched by plowshare or scythe, yield abundant sustenance not only to the herds of cattle that roam over them, but, at certain seasons, to myriads of buffaloes, antelopes and deer; close to the thickly wooded sides of the Highwood Mountain, in whose valleys are the most precious spots for farms, and whence plenty of timber can be obtained. No other part of Montana offers greater inducements to the immigrant and settler, as no other part of the Territory is more suggestive of commercial, agricultural and mineral wealth. But its chief claim to consideration, no doubt, is the fact that it stands at the head of the navigation of this mighty river, and nearly all the freight of the Northwest must be handled at Fort Benton as explained above. River transportation is increasing very fast, and becoming so cheap, through competition, compared with wagon freighting, that Fort Benton is buying its dressed lumber at St. Paul cheaper than at Helena, 1,500 miles nearer! The town consequently is growing very rapidly, and improving in its character and number of buildings every year. Two years ago there were only three white ladies in the town; now there are about seventy-five. Neat and comfortable residences have been and are being built on every street; and on every hand are seen evidences of a better and more progressive civilization. Heretofore it has been the case that a shanty or shell of any kind was all that was required to do business in, now the business houses have been so built and remodelled that it gives a substantial, solid appearance to the town. The successful establishment of Shell & Co.'s brick yard is a solution of the perplexing question of cheap and good building materials, and will, it is believed, revolutionize the method of building business houses and residences. Brick can be laid in the walls at \$21 per thousand. I know of no frontier town which can look forward to such substantial prosperity.

For Forest and Stream and Rod and Gun.

#### A CHRISTMAS IN PERIL.

IN CANADA, as in England, Christmas is a time for the full enjoyment of life, of freedom from care, and a determination to rise supreme to all the anxieties caused by trouble or impecuniosity. Even the poorest will on that occasion forestall the earnings of weeks to make merry with his friends; and those in a mediocre condition will become lavish in their expenditure, although fully conscious that each draft on the future must be met by disagreeable economy. In the city of Quebec this holiday time is more extended than in most places; it is a carnival of two or three weeks. What little business there is—and during the greater part of the winter hardly any exists, gives way to amusement and gaiety. Concerts, theatricals, parties, balls, charades, snow-shoeing, skating and sleigh-driving constitute a whirl of excitement, which no intensity of cold can chill, no blinding snow-storm smother. Warmly clad, the citizen of Quebec defies all inclemencies of weather and sets at naught thermometers at forty.

A short time since I spent the winter in that almost Arctic city, and really experienced how intense cold can be and how overwhelming a snow-storm may be. I had arrived in the autumn and enjoyed that mythical period, an Indian summer, so often heard of and so seldom witnessed, as pretended by the unbelievers of its existence. The cold, clear nights were followed by hazy mornings, preceding delightfully warm, sunshiny days, while the beautifully variegated tints of the beech, maple and birch, ranging from the pale yellow to the richest crimson, clothed hill and valley. The bracing air gave one renewed life and vigor after the relaxing heats of the

summer, and the contrast between the universal green and the kaleidoscopic panorama fascinated the eye. This weather continued for about three weeks, and gave way to easterly blasts and cold, cutting winds, followed in December by light falls of snow and biting frosts, which hardened the roadways to the durability of stone. Then appeared immense sheets of floating ice in the River St. Lawrence and its tributary, the St. Charles, and suddenly one morning the latter was found completely frozen over, and, although it may seem miraculous, horses and sleighs were the next morning passing over its surface. Roads were marked out leading from Quebec to Beauport and other villages and the Island of Orleans, and in two or three days long lines of vehicles were constantly visible passing and repassing throughout its entire length. Those arriving in the city were laden with firewood, hay, vegetables and fresh provisions, and took away in return drygoods and groceries. But the surface of the St. Charles River was again metamorphosed; a tiny village of about a dozen small houses rose as if by magic in the course of a couple of days, and the inhabitants seemed more numerous than the size of the houses warranted. Sleighs with occupants, dog trains and foot-passengers were continually coming to and fro, and the intercourse between the city and the mushroom ice hamlet appeared to cease not day nor night. I was told these houses, or huts, were built by fishermen who catch an immense quantity of fresh-water fish called tommy-cods, for a short season about Christmas time; they are caught in such numbers that they are sold for next to nothing, and supply the poor with wholesome food, not only during the season in which they are caught, but during the entire winter, for as soon as taken they become frozen and are then packed away in barrels and stored in an outhouse or shed, ready for sale, quite safe from any deterioration or decay. As by far the greater part of the inhabitants of Quebec are Roman Catholics—probably nine-tenths—this plentiful and cheap supply is a great boon during the long Lenten season. It is a favorite dish and, if properly cooked, is very good; but for my part I did not relish it, and I met with many of the same opinion as myself.

For two or three days before Christmas the city bore an unusual appearance of bustle and excitement; the shops had put on their best regalia, and tradesmen exhibited their most attractive wares; the more public thoroughfares were crowded with pedestrians and vehicles, and every one seemed busy in the purchase of presents and the other essentials of Christmas time; porters and express sleighs rushed through the snow-clad streets laden with parcels and boxes, and all seemed in a state of acute anticipation. To avoid the general hurry-scurry, and, perhaps, a little piqued at the indifference paid us by those who had formerly been attentive to myself and party as strangers, an indifference solely caused by the absorption of all the energies on the question of the day, the happy celebration of Christmas, I left with my party on a tandem drive to Indian Lorde, a village ten miles off. The road was level and hard, as not much snow had as yet fallen, and our horses went at a pace utterly impossible to achieve in summer on even the best of macadamized roads. We reached the village in about an hour and a quarter. Although the view of the Falls, surrounded with huge impending pieces of ice and the dazzling white snow was somewhat unique, it was far from equal to the superbly beautiful picture it presented when clothed in the many colored garments of autumn foliage. We returned to town at about ten, when we still found the city in the same state of excitement; every one was in the streets shopping for the wants of the morrow. We, who had no shopping to do, no preparations to make for the coming Christmas, found it intolerable, so determined at once to carry out a scheme which we had before coteemplated—a visit to the fishing *cabannes* by night, when, we were told, the best fishing could be had. The moon shone down on the busy streets as through a mist, and the atmosphere had become somewhat tempered, and in walking over the snow there was no sound of crispness, but our feet seemed even to make an impression upon it.

We left the busy streets and soon found ourselves on the ice of the St. Charles, following the road to the fishermen's huts. There was a cluster of them, arranged without any order, and at different distances apart, connected with each other by foot-paths. They all seemed to be about the same size—twenty feet square—having one door and a couple of windows, while beside each was a pile of firewood, and clear, wood fire smoke curled upward into the misty moonlight, from a common stove pipe, inserted either through the roof or a gable of the hut. On knocking at the door of one, and receiving a civil *entree*, we walked in. It is difficult to say whether the dense fumes of the very worst of tobacco, or the stifling heat was what most affected us. I have been in a sugar factory, where the heat is kept up to an average of 150 degrees; I have leaned over a charcoal kiln; I have smelled the effluvia from a beer vat; I have run a vessel loading horns and hides, and I have been in a patent drug factory, and in many similar places, but they all pale in nauseousness in comparison to the hideous aroma and oppressiveness which welcomed us to this Canadian fisherman's ice hut; six men, all smoking blackened, short pipes, sat on a bench, each having two fishing lines, which were secured to the ceiling, and which were cast into the river through an oblong hole in the floor the entire length of the hut, a hole of a similar size being cut in the ice. Several hooks were attached to each line, and all men were, as constantly as possible, employed in pulling in the lines, each time taking two, three, and sometimes four fish at one draw from the same line. Those taken measured from eight to twelve inches in length. In the centre of the hut was a common Canadian stove, heated to redness, while upon it was a pan of cooking fish. In close proximity to the stove was a pile of green firewood drying, from which the steam rose in stifling, vapory clouds. Two or three tallow dips gave a ghastly, glimmering light. The men themselves were fishermen who had been following their vocation night and day since the season began, and were not accustomed to be regular in their abitudini; in fact in retiring for the night their dormitory was in the very circumscribed attic of the hut, where musty straw palliasses, thrown on the floor, were the sole articles of furniture; they omitted the perhaps superfluous custom of disrobing. The reader, by circumstantially considering each of the above conditions may arrive at some vague idea of the effect of the *tout ensemble* upon us, who had just come out of the fresh air. A choking sensation seized me, and I dreaded instant death from asphyxia. My vision seemed to grow dim, a tightness across the forehead became agonizing, while a dizziness compelled me to lean for support against the wall. I did not recover myself till I was supplied with a small quantity of brandy from my flask. As soon as I could speak I insisted upon immediately returning, but my friends, who perhaps had not been so violently affected as myself, outvoted me, and showed me the absurdity of leaving without at least catching some fish. Very reluctantly I consented, and we intimated to our host our intentions. He was a Guernsey man, called

Christy Gunner, and had been a fisherman all his life, which had reached about sixty years—a weather-beaten red face, with blentery eyes, surmounted a spare and strapping figure, which was clothed in a red shirt, which had become of a decidedly blackened tint, and a pair of doubtfully colored pants, fastened around his waist with a string. On his feet he wore the usual *boths savages*, reaching to the knees, a kind of half-tanned moccasin, which, even when new, has a most trenchant odor. On his head was the country *bonnet rouge*. His companions did not greatly differ from him in attire. Christy Gunner was most attentive to us, and rapidly and dexterously outfitted us with the necessary fishing tackle, and baited our hooks with small pieces of raw liver. I cannot now recall the feeling uppermost in my mind, but I had not long been pulling up the tommy cods by twos and threes, and throwing them into a large box beneath the bench, than a certain enthusiasm or desperation seemed to seize me, an enthralling desire to beat my companions in their catch. Silently I baited and unhooked, unhooked and baited again, as if my life depended on the success of the trial of speed. I know not how long the contest lasted; but I was roused from my unconsciousness to outside things by one of the men calling out, "*Saurez l'eau est sur glace*." It was certainly covering the floor of the *cabanne*, but, as I wore rubbers, I had not perceived it. Myself and party considered that we were about immediately to be engulfed, but the *sang froid* of the men reassured us. I looked at my watch; it was five o'clock. We had thus continuously fished for about five hours, which seemed to me to have passed as one. I went to the door and opened it, and the cool morning breeze played on my forehead with such reviving freshness that I felt as though I had awakened from the grave to a deathless life. But I could see nothing. The blackness of night covered everything as with a pall. I could not see my hand. I was preparing to step out to still more enjoy the delicious breeze, when Christy called out, at the same time pulling me back by the arm, "*Ne sortez pas, monsieur, il y a plus qu'un pied sur la glace*." I did not in truth doubt him, but I took my stick, and in the darkness measured the depth of the water. I found it to be one foot two inches. In reflecting upon this very apparent fact, I began to doubt whether the *sang froid* of Christy and his companions was real or assumed. Again, I thought they might have means of escape which we should be unable to follow. The conviction momentarily grew stronger that our position was extremely precarious, and the anxiety of myself and friends became intense. In reply to my question of the cause of the sudden rise of the waters, he said that the tide, instead of raising the ice had overflowed it, and that the water would subside at its fall, which, as it was not yet at its full, would be in eight or nine hours. I asked him how high it might rise in the *cabanne*. "*Ah, monsieur, je ne puis pas le dire, peut être, un deux, ou trois pieds*." Here, certainly, was consolation for us, but I probably be three or four o'clock before we could leave the hut; and, again, the water would in a short time rise in the hut and compel us to seek refuge in the stilling attic. In the meantime Christy and his party kept up the fire, which I knew must soon be extinguished, and commenced cooking large quantities of fish. This was a wise precaution on their part, for were we to be imprisoned for nine hours, we certainly would require some sort of nourishment, poor as the substitute was. The fish were placed in a sort of cupboard nailed to the wall, in which I noticed plates, cups and saucers, and some bread. The cupboard was about three or four feet from the floor. But the contrivances of Christy to meet all exigencies were not yet completed. As soon as the fish had been cooked and placed in comparative safety, while some of the men were putting the catch of the night in a covered box, others were transporting the firewood to the attic, while others constructed a sort of stand, three feet high, on which, when completed, they placed the stove, near to the entrance-hole in the attic, and from which the fire could be fed. While these operations were being carried out, myself and party had retreated to it, and dismally waited the climax. The men in a short time joined us, and prevailed on us to partake of the humble meal provided, to which we added in the shape of the contents of our flasks. The water had now risen to three feet in the hut. Whether from want of sleep, or the excitement caused by our peculiar position, I soon lost consciousness, and, as I afterward discovered, so did my companions. From our heavy sleep we were awakened by Christy with the joyful intelligence that the tide was falling. It was three o'clock in the afternoon. We looked down to the floor of the *cabanne*, but to me it seemed unabated. Through a hole in the roof of the hut we looked out and saw the ice covered with water as far as the shore, above which stood the city, so full of gaiety and feasting, and where friends were no doubt wondering at our unaccountable absence. But by the assertion of Christy we became assured that we should soon be at liberty, and be enabled to keep the engagements for the evening. With this we were obliged to be content, and prepared resignedly to wait for our freedom. Again we partook of fish and bread and some brandy, and quietly smoked our pipes. "*Ce descend pas*," I shortly afterward heard one of the men say, who had looked at the water below. "What's the matter?" I asked. "The water," he answered, "had gone down a couple of feet, and had there remained; there was still nearly two feet on the ice." We must stop here till to-morrow morning, or till help came. There was no use complaining; we had but to submit to cruel fate. The fishermen were in the same position as ourselves, and would, if they possibly could, have reached the shore. To wade through two feet of water for three-quarters of a mile, with the constant danger of falling into an air hole, was not to be thought of. Disconsolate and sick at heart, we turned over and tried to sleep, but that was banished from us. The evening came down in its dense darkness, and again we forced ourselves to eat, again the approaching tide was announced, and, oh! joy, the water did not rise in the *cabanne*. This was a *corps sign*. The water would flow off the ice and we could leave by four o'clock in the morning. I will not attempt to say how long the hours were passing. No wonder Marie Antoinette's hair turned gray in a single night. I cannot conceive how it was mine did not. Then another trouble fell upon us, the fuel became exhausted, the fire extinguished, and the intense cold penetrated our very bones. I think were it not for the dimly light shed by the tallow dips I should have gone mad. To meet trouble in the daylight, or when one can see, is bad enough, but to be in its power in the darkness is too terrible. I thank these puny dins for my reason.

In our anxiety and apprehension we had let our watches run down, and but for the sagacity of Christy we should have had another grief. Our questions as to the hour must have tried his fisherman's patience. At last, at last, when hope was at its most dead, the faithful, tried Christy proclaimed the joyful intelligence, "*Messieurs, nous pourrions descendre*." We needed no second bidding. We were quickly on the icy floor of the *cabanne*, and Christy opened the door. The moon shone

**CRAYFISH.**—There is no reason why greater attention should not be paid to growing crayfish. They could be raised in almost any of our small rivers or creeks. At present the crayfish comes to market from the Potomac, and principally from Milwaukee. If people only knew that crayfish are in good demand in the New York markets perhaps they would try to catch these delicate little crustaceans. The flesh of the crayfish is far more delicate than that of the lobster without being indigestible. Whoever has eaten a *potage bisque*, a soup made of crayfish, will never forget its excellence; and for a centre of a dinner table a pyramid of crayfish makes the handsomest of edible ornaments.

**SYSTEMATIC FISH COMMISSIONERS.**—The New Hampshire Fish Commissioners are preparing for their next report a full record of the number of ponds, acres of each kind of bottom, whether rock, sand or mud, and kind of fish found in them in every township in the State. By this means they are enabled to proceed intelligently in the distribution of fish to the waters suitable for each species.

## Natural History.

For Forest and Stream and Rod and Gun.

### DEER SHEDDING THEIR HORNS.

BY HON. J. D. CATON.

I HAVE observed several communications lately in **FOREST AND STREAM** discussing the question as to the time when the antlers of the deer are shed. Will you allow me a little say about it, as it is a subject which I have examined with some care.

All of our American species of deer cast their antlers irregularly from October to May, except our elk—the wapiti deer. He alone uniformly carries his antlers till spring, and casts them with great regularity in this latitude in April, or, those with their first antlers, in May. There is this general law governing them all, that aged animals mature their antlers sooner, and cast them earlier than the younger specimens, the youngest being the most retarded. This law does not govern after the animal has attained full maturity, that is, the growth and maturity of the animal are not further accelerated after that time; and in some of this species there are frequently individual exceptions to the rule. Still it is general with all, except possibly with the wapiti—the time of shedding the antler does not necessarily depend on the time of its maturity. I have observed the greatest irregularity in the time of casting the antlers in the common deer, and this does not seem to depend on the condition of the animal, the character of their food, the temperature of the weather, nor indeed upon any assignable cause which I have been able to discover.

The time of casting the antlers of the common deer may be said to be from November to April, inclusive, but very much the largest proportion are cast in December and January. Some seasons nearly all seem to be carried till January and February, while in other seasons nearly all are gone by the first of January.

To illustrate the great irregularity in the time of casting the antler by the common deer, I may refer to the case related by me in *The Antelope and Deer of America*, pp. 181-2. There a four-year old deer cast his antlers in April, in 1869, and in November following he cast the antlers grown that year. In the first instance he carried his antlers the longest of any adult deer in this part, and in the next he cast them the first. In both cases the deer was in perfect health, and in very fine condition. I sought in vain for a solution of this remarkable contrast.

The observations of a few specimens, or of many specimens, for a single year, or even several years, cannot furnish information to be absolutely relied upon, and no matter how extended one's observations may have been, unless he is in the constant habit of noting down his observations at the time, he may not rely upon them with certainty. If he trusts to memory alone, no matter how retentive his memory may be, he is liable to be misled. Let any one take notes of events, and then after a considerable time write his observations from memory, and he will be astonished at his errors on comparing the result of his memory with his notes. You can do no greater service than by inducing sportsmen to make full notes, at the time, of everything interesting or unusual which they observe. If they would generally adopt this plan, they would soon accumulate a vast fund of very useful original information, and they would soon find a new enjoyment in the chase.

I see I have departed, in my conclusion, from my purpose when I commenced this article, but we are on a subject I have much at heart.

We take great pleasure in printing the above very interesting notes from Judge Caton's pen, the more so as we are quite sure that they will be new to the very great majority of our readers. Judge Caton has certainly the right to speak authoritatively on this subject, for none of our naturalists have given more time and care to the study of the very interesting group of which he writes. His remarks upon the necessity of noting down at once observations made in the field, is most timely and important, and it is but a short time since that, in an editorial, we urged the same thing upon all who are interested in natural history.

Judge Caton's remarks will, we are sure, interest all sportsmen, and not the least our friend Penobscot, who writes us from San Francisco, Cal., on the same subject, as follows:

The letters of "Antler" and "Sycamore," to your very interesting journal, were very important in one respect at least, as they bring out the fact that deer, in separate portions of the country, cast their antlers at widely different seasons of the year, a fact of which the vast majority of sportsmen must necessarily be ignorant, and proves (if any proof was wanting) the great value of a national sportsman's journal, like your own, circulating all over our common country, and affording a medium for the free interchange of views and facts from every portion of it. Before visiting this coast I had taken it for granted that the antlers of deer sprouted and were cast at the same seasons throughout the country, and was therefore much surprised, on visiting Woodward's gar-

dens, the first week in February, to see the bucks confined there still carrying their antlers, apparently as firmly set as ever, but was not sure it was not the result of captivity, and have since met with no one who appeared to be thoroughly posted as to the time in which they were shed when in their native wilds. Believing that facts as to the time in which they sprout and are cast in all parts of the country would be both interesting and instructive, I have written the following facts regarding the deer in my native State, hoping that in time we may hear from all parts of the country in which these interesting animals are found:

The antlers of the deer in Maine begin to grow the very first of April, but naturally very slowly at first, as the animal is then in very poor condition, and can hardly find sufficient food to sustain life. After the first of May, by which time the green herbage has well started, they grow very rapidly, and by the first week in July have attained their full dimensions, except as hereafter noted; and at this time they present a singular and imposing spectacle. The antlers are nearly twice their normal diameter, and at each point, as well as at the places where the prongs appear are oval-shaped protuberances, at least an inch and a half in diameter. The antlers now begin to harden at the butt, and soon circulation ceases, but the points and prongs still continue to grow by absorption of the egg-shaped ends, and form points more or less fine, according to the age and condition of the animal. By the 15th of Aug. the antlers are hard throughout their entire length. Immediately after reaching this state, the velvet commences to peel off at the butt, gradually extending to the tips. This process is never hastened by the buck rubbing his antlers against trees, all reports to the contrary notwithstanding. A moment's reflection will convince any one of the futility of such a thing. The antler has now become a mere excrescence, devoid of all feeling, and whether covered with velvet or bare can be a matter of no moment to the carrier. The animal begins to attack the trees about the 1st of October, at the commencement of the rutting season, and a full month after the velvet has fallen off the antlers of those that inhabit my own State. If there are parts of the country where the velvet does not come off till October, then that period and the buck's tree-attacking fury will occur at the same time, and so give rise to a natural error. The rutting season is at its height about the middle of November, and does not entirely cease till nearly a month later. Nineteen-twentieths of all the bucks, except the yearlings, cast their antlers between the 20th of December and the 1st of January. These carry their "spike horns" a month longer.

I never saw a yearling buck without horns, and have repeatedly seen fawns with one, and sometimes two little antlers, from one to three inches in length. When this occurs he will have one prong the next year. No buck in the forests of Maine retires to any secret place to shed his antlers, or bruises them after being shed. I do not even know what is meant by a "secret place" in a forest. All parts are equally open, and equally secret to the still-hunter. As there is anywhere from two inches to two feet of snow on the ground in Maine and the Adirondacks, where the antlers are cast, any practices of that description would be detected, and if buried the marks would be "powerful plain," and as the antlers are never shed simultaneously, except through accident, the buck would be obliged to return and reopen his "cache" or make another one. And how would he proceed to cast them after arriving at the appointed place? By knocking them against a tree? One could as well imagine an alderman purposely pounding his pet corn against a bed-post. The buck's head is excessively tender at this period, where the antler joins it, and he carefully avoids, as far as possible, hitting it against the smallest obstruction. The buck, if undisturbed, lets his antlers severely alone till they fall by their own weight; although if roused by dogs, or wounded by the still-hunter, he will frequently tear them both off in his mad fight, and more than once I have seen them fly ten feet asunder when shooting the animal through the head. The numbers which I have picked up during a twenty-years' hunting experience would comfortably fill an ordinary city bed-room, and they have been in all stages of preservation from those just cast from the animal I was following to those all but devoured by mice.

The popular idea which seems to obtain throughout the entire country, that the old bucks are defeated by the "spike horns" (the yearlings are called at home), I totally dissent from. I have not only seen the marks on the snow of hundreds of combats between bucks, but have often killed one, and a few times both of the combatants, while thus engaged; but I never knew a yearling to even attack a full grown buck, much less defeat him, and would like to hear from the man who has. In regard to the number of prongs, as indicating the age, not the slightest reliance can be placed on it, but an expert hunter can judge very nearly of the buck's age by the general appearance of the antlers. They increase in length, and the prongs in number each year till the animal is four or five years old, then they have attained their full length and beauty. After this they increase in diameter only, as long as the animal retains his full vigor, so that at eight years old the buck's antlers are nearly twice as heavy as at four; as age diminishes his powers, the antlers decrease in length, are much less symmetrical, and have coarser points. They also fall earlier, sometimes before the middle of December. The fawns lose their spots, to a superficial observer, about the last week in August, when they shed their summer coat, but a close inspection in a strong light will reveal a single row of very faint spots, extending the whole length of the body, just below the spine and on each side of it. These remain till the winter coat starts, the last of October; but they can easily be told all through the winter by the shortness of their heads in comparison to the length, by the greater length of the hair on each side, and by a general look of immaturity. A veteran still-hunter would consider himself insulted if told that he could not distinguish a fawn from a yearling at a single glance fifty paces distant, provided he saw its face. Of the two types of deer which are well known to exist in Maine, of several interesting peculiarities exhibited by those in the Adirondacks, not shown by those inhabiting the former State, space forbids me to speak. The subject is almost inexhaustible, and I may as well stop here, only adding that the above notes are the result of many years patient observation and successful still-hunting.

To the store of valuable information contained in the above papers, we may be permitted to add one note. In Nebraska the fawns of the common deer retain their spots considerably longer than as above related by Penobscot, and specimens killed the last of September are still strongly marked. At this time, however, the summer coat is fast falling off, and, no doubt, by the middle of October the young are uniform in color. Moreover, the faint row of spots on each side of the spine, of which our correspondent speaks, does not seem to

be confined altogether to the young deer, for the largest and finest buck we ever saw, which we killed this fall in Nebraska, has just such a row of spots running down the back. This state of things, however, is unusual, we think. We have never noticed it before, and it attracted our attention as soon as we reached the dead animal. We hope ere long to hear more on these interesting topics.

**THE KING PARTRIDGE.**—In an interesting communication to our columns under date of September 27, of upon the habits of the ruffed grouse, a new term, "King Partridge," is chosen to express exceptional peculiarities of habits on the part of the male bird. The language of the article is likely to lead to misconstructions, not warranted by actual facts observed as to the habits of this species. The term of king partridge would seem to imply an isolated occurrence of a patriarch of the tribe, which may not occur in the lapse of many years. Under this supposition a hunter may spend the half of his life in pursuit of this bird, and never obtain a glimpse even of such a remarkable superannuated male, who is entitled to take rank as a king partridge. The account, as given in the communication, ceases, however, to excite unusual surprise when analogous cases, in the order of gallinaceous birds, are taken into consideration. The entirely different aspect of our barn-yard turkey when his temper becomes ruffled, from his general appearance in his usual mood, are well known to all who have amused themselves by exciting the anger of an old gobble. His attitude offers many points of resemblance to those observed by our correspondent when speaking of the king partridge. All of the feathers, particularly those of the back, become almost perpendicular. The primaries of the wings are sharply separated, and trail in angry sweep the ground. The tail becomes a perfect pattern of a fan, and neck and head are deeply suffused by the quick rush of blood surging toward the upper extremities of the offended lord of the barnyard. If he only possessed the ring-like ruff of feathers like his wild relative, the ruffed grouse, a perfect crown, or ring, would quickly develop itself around his well drawn in head, and a magnificent edition of the king partridge, a veritable king turkey, would be the final result. We may view at ease, and as often as we please, this interesting spectacle in our domesticated tribes; but we experience difficulties when we wish to extend our observations to the wild members of this order of birds. They are only too much an object of pursuit on part of the indefatigable sportsman and their countless natural enemies, to indulge in these antics, which mostly result from sexual excitement and jealousies toward rivals of their own persuasion. Since an audience is not wanted on account of its being intrusive, the dramatic displays are limited, and probably only enacted under extremely rare combinations of favorable circumstances, when no observer is near. We know on the authority of Gould that the black cock of Europe is addicted to like habits, and that the entertainment in the case of that bird is frequently enhanced by drawn battles, in which a number of excited males engage to gain undisputed supremacy over the females of the vicinity, who are said to be then often silent spectators of these conflicts. It is possible that the ruffed grouse would act in the same way under such circumstances, and by the erection of all the erectable appendages give rise to the singular appearance which led your correspondent to the adoption of such a singular name. But few observers would ever be gratified by an opportunity to watch this most shy of all game birds in its fancied security, and the full display of its handsome ornamentations in order to render himself formidable to its competitors in the struggle for possession of the female.

The pairing season would thus be inaugurated by the advent of the king, the oldest and most excitable cock, who gains at last a well-earned victory over all the rest of the aspirants in these erotic tournaments. The widely varying attitudes of the bird while drumming or standing perfectly erect, when wishing to evade observation on the knotted limb of the hemlock tree afford full evidence of its faimical powers, which are reaching their climax when laboring under periodical sexual excitement, and cause thus an apparent entire transfiguration of its smooth appearance when ready to fly on approach of danger.

### HABITS OF THE RUFFED GROUSE.

TESTIMONY OF A VETERAN.  
ST. JOSEPH, Mich., Dec. 17, 1871.

#### EDITOR FOREST AND STREAM:

As much of the sportsman's pleasure follows from reflections of incidents which occur on a day's hunt in the field or forest, so does a large share of our enjoyment come from detailed rehearsals of chums as they gather in social chat over events and occurrences that have passed during the day. The spicy account of this and that—which chance was so—if it had or had not been for such—I should—and how I missed that good, or fair, shot I don't see.

Many of these chats give zest to the recreations of sportsmen from the busy cares of life. This is one reason why I look so anxiously for your **FOREST AND STREAM** weekly, and on this account it has become a sportsman's necessity. One seems to meet with brother sportsmen from north to south, east to west, and enter into a sportsman's paradise.

Every one has something of interest to relate. Each gives his own views, in his own way, his own explanation, theory and philosophy. Much of the natural history is quite entertaining, with much that is equally ridiculous. But still it prompts one to thought and closer observation. While I confess I am much interested in articles of many correspondents of the **FOREST AND STREAM**, many things excite my riddles, look quite fishy, and are as ridiculous as some of the questions asked the Editor.

Some time ago we had an account and description of the "King Partridge." I am just past my sixty-seventh year, always loved the rod and gun, have spent many enjoyable days in their use, a great lover of Na-

ture, can sit in some secluded dell, or by some rippling stream to watch animal and insect life of all forms on earth, air or water; study their habits, and have discovered many wonderful things, but it has not fallen to my good fortune to see a "King partridge!" My greatest desire now is to see one, and then "depart."

But I have led off from my first intention in writing, which was suggested by a correspondent of Ferrisburgh, Vt., on the ruffed grouse. He starts off—whizz!—hang!—gone out of sight like an arrow, Mr. Grouse! Well, that is much my experience. Quite often, at least, I am fully of his mind, "they are not easily killed," and if hit, the hardest bird to bring to bag I know of.

Two this fall I will mention: Out with H. hunting pheasants, a bird flushed on a side hill, and when clearing the top through the brush, I got in a shot, and right after, H. one. We could see that each hit the bird, and supposed it fell, but on search, it could not be found. Giving up the search, we passed on thirty or forty rods, and began to hunt another ravine. Part way down my dog came to point; we came up and found the bird dead and warm. After that we were out, separated by at least 200 yards, each in a ravine. H. shot at a bird, and, at the report of his gun, I turned and looked, and in a short time saw a pheasant come over into my ravine and fall dead. When plucked of its feathers, it was found to have been hit with eleven No. 6 shot, and still this bird flew, apparently well and strong, till it dropped dead. I pronounce them the hardest of all birds, even when hit, to kill, and would always advise to follow on with your dog, even if there is no sign of hitting them.

The habit of the pheasants, when they break the coveys in October, to scatter to ravines and thickets, through fields and even into towns, is, I think, common and universal. It has always been my observation. Early in the morning, from daylight till after sunrise, you may often find them near houses, in the garden bushes or yard shrubbery. Every fall, in our little village (8,000) many are killed, and occasionally one flies through a window or against a white painted house, and is killed in so doing. Much is said about the manner of producing sound in drumming. Let any one fill the air sac under the wings, and they will find an easy solution of the matter in the manner the bird strikes its body with its wings.

I would like an opinion of those who call themselves good wing shots giving the average number of shots to get one bird. The opinion of our boys is, in general shooting, four shots to one bird killed—that is, good and average shooters. There are those who do much better than this. I have been out on these conversations, and have kept a little data: On a two days' hunt I made thirty-five shots, killed sixteen birds; and crippled two, which, I have no doubt, died; we went two days ago, shot at four birds, and got three. These were my best this fall. Last fall I made twelve shots one day, and got five quail, five pheasants—all at single birds—and one rabbit; many, many times much worse. I make poor shooting some days. But you will see, Mr. Editor, that sixty-seven years have dimmed my eyes, for I am travelling on the sixty-eight road.

LUTRON.

STRAFFORD, Ont., Dec. 8, 1877.

EDITOR FOREST AND STREAM:

There have been a good many grouse about this fall, and having been in the woods a good deal, I have had some opportunity to study them. Frank Forester says that they seem to hang heavily at first in the air, but I think that had he hunted them around here, he would have changed the reading of that clause, at least. I have never seen them hang long enough to shoot at, and in most instances, to be seen, for, when flushed, they start as if shot from a cannon; and it takes a quick eye, and still quicker aim, to shoot them with any degree of success. A good bag of ruffed grouse is a thing any sportsman may well be proud of, as it shows skill in shooting, and a considerable amount of patience and perseverance in struggling through the thickets, where they are generally found. As "Awahsoose" says, they are not the most easily killed birds in existence. Once, while shooting this fall, I started two from a small cedar thicket, and as they had to cross an open space to gain the main woods, I had a fair, open shot at them for about fifteen or twenty yards. When I fired I had the satisfaction of seeing one of them drop in the brush, but upon putting in another cartridge and walking up to the place, my bird was nowhere to be seen. I searched for some time, and was about giving up the hunt, when a friend who was shooting with me, came up with his dog, and then I set Juno, with her keen nose, to find what I could not. After hunting for a minute or two, she found the spot where the bird struck when it dropped, and on trailing it up, I found my bird hid away under some brush fully 100 yards from where it had fallen—not then dead, but nearly so, as it died in my hand within a minute after finding. I marked this bird, and when plucking it in the evening, found that no less than seven No. 5 shot had struck it, two of which had passed through the lungs from side to side. Like "Awahsoose," I have never seen or even heard of a king partridge, although I have had considerable experience with grouse. Penobscot's article in your paper was the first intimation I had that such a thing existed, and on inquiry among some old woodsmen, I cannot find any who have ever heard of such a thing, much less seen one.

The habit of the ruffed grouse in leaving its usual haunts does not seem to be peculiar to one place only, as I have repeatedly observed the same thing here. Last fall, while sauntering up the river looking for a stray duck or snipe, I flushed a grouse from a small bunch of willows near the water, and had the luck to get him, although I was not expecting such game. There was no other bush or trees of any kind near, and the nearest cover, when any of them were to be found, was a full mile and a half away. This was late in the fall, and all the leaves had been down some time, so that theory will not hold good in this instance. It could not have been want of water, as there was a stream running through the cover where the birds were to be found. Another instance: Late in the season, after the first fall of snow, a gentleman living in town happened to be on the lawn in front of the house, when his little son called his attention to two birds under one of the spruce trees with which it was adorned. Upon investigation they proved to be the ruffed grouse, which had thus ventured so near civilization, and were fully two miles away from their usual haunts. They stayed for two days, but on the third morning turned up missing. While in Muskego last fall I frequently saw them shot in a clump of larch that had been left near a spring on the farm of a settler. Certainly, the woods were only a short distance away, but water was plentiful in them, so why did they resort to the small clump of trees, not covering the twenty-fifth part of an acre?

About their drumming: I can testify with "Penobscot" and "Awahsoose" that they will stand on a rock to drum, as I have seen them do so; also on a stump and, once or twice, on a tree that had not long been felled. But there is one curious point that I would like to ask some older shooter than myself—What causes them to drum during the night time in the fall, or do they do so in the spring also? This fall, while duck shooting on the Au Sable River, we camped in a thick piece of pine and oak woods near the river, and several times during the night while there, I heard the grouse drumming in our vicinity. We went after them several times, and in every case where I got any, I found them to be solitary birds, and, in every instance, cocks. I did not see a hen bird killed, although a good many birds were shot. Perhaps "Penobscot" can explain this point.

About shooting them from a tree: I saw a man shooting near here about two years ago, who had a small terrier dog with him. On first going into the woods the dog flushed a covey of them, and all the birds flew a short distance into a hemlock tree. The man went up, and, standing in the shelter of a small bush which hid him from them, began

by shooting the lowest. As he had only a single-barrelled gun, he lost considerable time, but, nevertheless, managed to secure seven of them before the rest were frightened, and sought safety in flight. I have since killed four myself in a similar manner, and when shooting one, the rest did not seem at all disturbed. I do not see anything unsportsman-like in shooting them on a tree. As they are so shy and hard to hit that I kill them any way I can that is, lawful! and I would advise all sportsmen to do the same when they get a chance. More anon.

AU SABLE.

## The Drumming.

NORTHERN NEW YORK, Dec. 24, 1877.

EDITOR FOREST AND STREAM:

Although the above topic has been discussed at length in your columns, it seems by no means settled to the satisfaction of all. So please permit me to tell what I have seen and heard.

For a number of years, from the age of fourteen to twenty, I lived on the border of our great Southern (to you Northern) wilderness, where a part of my time was spent in hunting and trapping. During that time and since I have seen a good many grouse in the act of drumming, and in some respects my experience will differ from that of others. In the first place I never saw a female with or near the male bird at such times, and I have often hunted the ground over thoroughly for a considerable distance around. The male commences drumming just as soon as the snow is off the tops of the logs and hillocks. At this time, an hour or so about sunrise is the usual extent of time occupied. Later, and at the time the hen is sitting, he drums almost constantly, taking only three or four short feeding spells during the day, and if the night be fine and moonlight, if you chance to be camping out, you will hear him at intervals during that time. As summer approaches the drumming grows less and less and finally ceases till colder weather in the fall, when snow birds drum, though probably not all, as one hears but little as compared with spring time.

As to the hollow log I never saw one drum on the ground, though I have seen them on moss-covered rocks as well as logs. The latter, however, covered with moss and situated in a thicket seem to be the favorite places. The reason I think is this, instinct teaches Mr. Grouse that his noise may attract the attention of his natural enemies, foxes, hawks and owls, to say nothing of the boy with his twenty shilling shot-gun. In the open he is exposed to all these. In the thicket, from his elevated standpoint on log or rock he is comparatively safe, as hawks cannot pounce upon him, nor fox or boy approach him unawares. If not disturbed too often he will usually stick to one log the entire season, and the same log is often occupied for a number of years, though whether by the same bird or not I cannot say. Now the act itself. I recollect one particular instance. A few years ago, in the month of May, I was at a pond in the depth of the wilderness trout fishing. Close by the camp was quite a hill that came down close to the water, the side of which was rough and broken, with rock and ravine and somewhere up its side was a partridge drumming. One morning I started out to find it. This was done by going slowly and stopping from time to time to listen. At length when well up the side hill and at the edge of a little windfall a few rods in extent, partly filled with second growth, I paused close to the roots of a large spruce that had fallen. The roots, covered with earth, completely hid me from all beyond. I did not have to wait long to locate my bird. It was so near as to almost startle me. Changing my position a very little I could look through between the roots of the tree, and there sat Mr. Grouse within fifteen feet of me. I stood and watched it drum a dozen times or more before a slight noise on my part attracted its attention. It sat up straight, just as a hawk or eagles does upon a limb, turned its head with a quick tearing motion right and left two or three times, and then seemed to draw its head down close to its body, half closing the eyes. Then commenced the motion of the wings. These were raised or spread but very little and brought back or struck against the side with a quick, light blow three or four times, with a moment's interval between blows, when suddenly it changed to a harder blow with the wings extended further, say half open, and after the first half dozen strokes the motion is too rapid for the eye to follow, but growing less in strength, till it stops with a sudden whirr. It would now stretch up its neck and look around right and left as if on the lookout for enemies. Sometimes it would not change its position any more than this, but in a few moments it would walk up and down the log for a few feet, but always in a natural manner, looking about as if its only object was to guard against surprise. I have seen the male of the spruce partridge drop its wings and strut about with all the importance of an old gobbler, but have never seen the ruffed grouse do so. As to the production of the noise made in drumming I always supposed it was caused by the striking of the wings against the body. I have watched a good many, but never was so near another. I have watched some till they left the log and have then observed them feeding alone. At this season, May, I have often seen the female from sunset till dusk, which I take to be her time of getting food when sitting. The first chance I have I will find out if possible about the air pouch your correspondent "Monon" talks about. I never heard of it before.

LADOC.

THE WOODPECKER AS A FLYCATCHER.—In a late number of *Harper's Magazine* I noticed an item concerning the catching of flies by the common red-headed woodpecker. Reading this recalled a fact that came under my own observation, which I will proceed to relate: In the summer of 1863 I was living in a small town in middle Alabama, not far from Selma. In one corner of the yard there stood an old china tree, the top of which had been shattered by a storm. At the time of which I write, a pair of red-heads were engaged in rearing a brood in a hole which they had excavated in the old tree-top. This tree was the only one in a decaying condition within a radius of at least one-fourth of a mile; and from lack of his accustomed food the red-head was forced to resort to a diet of flies. At least this is the way in which I accounted for what I thought a departure from the traditions of his ancestors. The bird assigned to duty as caterer took a position on the twisted lightning rod of the house, and from this point of vantage darted with unerring aim upon his winged prey, taking them always in mid-air, after the manner of all flycatchers. I remember to have thought this very singular, not having seen any mention of it in such works of ornithology as I had read, but allowed it to pass from my mind until the paragraph in *Harper's* recalled it to memory.

WILL.

QUAIL WITHHOLDING SCENT.—A correspondent in Mahoningtown, Pa., states that he has noted several undoubted instances of quail withholding their scent. Among others was that of a wing-tipped bird, which the dogs failed to find, though they ranged all the ground over thoroughly. Subsequently returning to the same spot the bird was found. The writer concludes:

That under certain conditions of the atmosphere a quail alighting on the ground, and not moving from the spot it first

alights upon, does not give out enough scent to enable a dog to smell it. Of course one must bear in mind that when a quail is not in motion its feathers are always pressed tightly and compactly to its body, which in a great measure tends to withhold its scent.

A LARGE HERONRY.—Our friend Dr. T. Garlick, writing from Ohio, tells us of a nesting-place of the Blue Heron in the olden time. He says:—

"The last number of *FOREST AND STREAM* has an article on the nesting-place of the Wood Ibis, which reminded me of a breeding-place of the Blue Heron (*Ardea herodias*, Linn.) that I went fifty miles once to see. It was in the midst of a wilderness, covering from twelve to fifteen miles square, a region of flat land, filled with many small swamps, inhabited by myriads of frogs and lizards.

"The forest was mainly timbered with swamp oak, the trees being of immense size. The woods were literally alive with these birds. I counted on one tree thirteen nests; there were hundreds, if not thousands, of nests. I was amused to see a number of unfledged birds, out of their nests, walking through their long, still-like legs, on the limbs of the trees. One fellow made a misstep, and lost his balance, but hung by one foot, and finally got his long neck over the limb; whether he ever righted himself I do not know; I left him "doing his level best" to get back. I could not help him, for he was nearly a hundred feet high.

"This nesting-place was in the township of Richmond, Ash-tabula County, O., now a thickly settled country. Since my recollection that region was full of game, elk and deer in abundance."

PROPAGATION OF THE EEL.—Owing to the obscurity that exists respecting the propagation of the eel, the following statement made by Herr L. Griesinger, of Murrhardt, to the Schw. Institution, may be of interest. Herr Griesinger writes: "On Saturday, August 13 last, some workmen who were preparing the foundation for a railway bridge over the Murr, observed an eel in the still water of a channel, a quarter of a mile below the town. The men had hammers with them for stone-breaking, and, wishing to kill the eel by a blow on the head, one of them hit it, but only in the middle of the body, which was greatly lacerated. Owing, however, to the toughness of the skin, the parts held together. It was an ordinary full-grown eel, but unusually stout. I bought it and set about skinning it in my kitchen, an operation that necessitated a strong pull from head to tail. At that part of the body which had received the blow, a total separation took place, and at the same moment there fell out upon the table an animated bag or ball about the size of a walnut, from which there escaped a number of active young eels. In circumference they were of the dimensions of a large knitting needle and as long as a man's finger. They lived for an hour, during which time they wriggled about on their sides. The parent eel seems to have quitted the rapid water of the Murr for the still water of the channel to deposit her young.—*S. in Land and Water.*

AN INTERESTING SNAKE STORY.—"Snake eating snake" is no imaginary story. I can add my own evidence in substantiation of the fact. Several years ago, when weeding corn in my Pugh Island, in the county of Northampton, N. C., I discovered a very large king snake lying on a ditch bank, perfectly straight, and unusually large. I called the attention of my servants to the snake, and directed that no snake of that species should be killed on my land, as they were said to be the special enemy of all venomous reptiles, particularly the highland moccasin. By the by, I had been bitten by a moccasin, and, barely escaping with my life, my sympathy was quite reasonably excited in behalf of his enemy. My servants promised obedience. I took from the hands of one of them a weeding hoe, and attempted to wake the snake by chipping off a part of his tail. The operation was quite artistically performed. The snake, however, did not relish it, and immediately began to disgorge a large highland moccasin, recognized by us as the most venomous of all found in this section of the State. The Hon. J. J. Davis, the present representative in Congress from the adjoining district, gave me a history of a similar occurrence which he himself witnessed. Stopping at a branch to water his horse, while on his way to one of his courts, he discovered the tail of a small king snake firmly fastened around a twig, the body immersed in the stream, and he holding fast to a large water moccasin, double his size, which was struggling heroically for his life. The contest continued for some minutes, the moccasin drawing the king snake under the water, and in turn the king snake drawing the moccasin to the surface. The victory finally resulted in favor of the little king snake, and the Hon. Mr. Davis remained a passive spectator during the whole struggle. I think he stated that after the termination of the affair he pulled them both ashore. The king snake is not the black snake, or black runner. He grows to a much larger size, and is black, with white rings around the entire body. I really do not know whether or not he is venomous. The black snake is certainly not, though by quick rattling of his tail, and rapid ejections of his tongue and apparent preparation for the fight, he would make a very different impression upon one.

T. G. T., Gaston.

PHILOSOPHICAL SOCIETY OF WASHINGTON, December 22.—Mr. Theodore Gill made a communication on a new species of chimara found in American waters. One of the most unexpected discoveries recently made in American ichthyology is that of a species of the genus *Chimara*, of which a specimen has lately been sent to the Smithsonian Institution. It was caught southeast of the La Hava bank, in lat. 42 deg. 40 min. north, long. 63 deg. 23 min. west, at a depth of 350 fathoms, with a bait of halibut, and sent to the Institution by Captain Robert L. Hurlbutt. An attentive comparison of the specimen with individuals of the European *Chimara monstrosa*, renders it evident that it does not belong to that species, but is an entirely distinct specific form. It may be named *Chimara plumbea*, and diagnosed as follows: *Chimara plumbea*.—A *Chimara* with the snout acutely produced; the anteorbital flexure of the suborbital line extending little above the level of the inferior margin of the orbit; the dorsals close together; the dorsal spine, with its anterior surface rounded; the ventrals triangular and pointed; the pectorals extending to the outer axil of the ventrals; and the color uniformly plumbeous. By these characters the species is readily separable from the *Chimara monstrosa* and other species of the genus.

A BEZOAR STONE.—A beautiful Bezoar stone has been sent Professor Holmes for examination. The father of Rev. John W. Lemacks, of Waltherboro, obtained it about seventy years

ago from the stomach or viscera of a Carolina deer (*Cervus virginianus*), and it has been retained ever since as an heirloom in the family. The stone is about two inches in length and in diameter at the middle. In form it is not unlike an elongated egg, somewhat pointed at each end (a prolate spheroid). The surface-coating of phosphate of lime is highly polished, and of a mottled brown color. In the presence of a party of gentlemen at "Ingleside" the stone was carefully cut a few days since, and, as was expected, a hard substance found in its centre, which proved to be a pebble of quartz.

The nucleus is covered with a deposit of phosphate of lime in nine annual layers, showing a growth of at least that number of years.

This is the fifth Bezoar or Persian medicine stone examined by Professor Holmes. The first contained a flattened ball, or buckshot, of lead; the second, a quartz pebble; the third and fourth each an acorn, and the fifth a pebble like the second. The buckshot specimen was destroyed during the war, when Professor Holmes' library was burned, but the others are at present at Ingleside, and form, perhaps, the most remarkable collection of the kind known. A description of the buckshot specimen, with colored figures, was published many years ago in the *Charleston Medical Journal*, and copies in photograph have been lately made of it.

Ingleside, the country seat of Professor Holmes, contains just now not only these rare Bezoars, but one of the most unique collections of the abnormal forms of antlers of the Carolina deer we know of; the main hall, library and cabinet walls are hung with about two hundred specimens, which are greatly admired, not only by sportsmen and naturalists, but excite the wonder of many Northern tourists who visit annually these ancient "baronial halls of Goosecreek."—*Es.*

**VITALITY OF ANTS.**—A number of curious observations have been made by the Rev. H. C. McCook on the endurance by ants of extremes of heat and cold, and the results have been published in the proceedings of the Philadelphia Academy. This year a formicary of *F. pennsylvanica* was cut from an oak bough, and exposed out of doors to the rigor of a mountain winter, and survived. A number were dropped separately upon ice, and were found alive after forty-eight hours, each in a little depression. *F. rufa* was found active in its formicary at 84 deg. F., sluggish at 30 deg. The extreme of heat seemed also to be endured by *F. pennsylvanica*; they did not suffer at all from the heat of stones walling in a camp fire, having been driven into the position out of a burning stump. A community of agricultural ants (*M. molefucens*), lived in a mound upon which some smiths in Texas made their fires for heating wagon tires. Numbers of ants were seen at work by Dr. Linneum cleaning out the entrance to their city before the entire extinction of the fire just used for heating tires. They had learned all about the fire and knew how to work in and around the dying embers without injury. A quality of mason ants (a variety of *F. rufa*), observed by Mr. McCook, were accidentally flooded under five inches of water, and they appeared quite dead and floated about in this condition for many hours; but subsequently most of them recovered full activity. In Texas Mr. Linneum found that the agricultural ants are seen in great numbers in wells, forming a sort of floating mass as large as an orange, clinging together. In this condition they got drawn up in the bucket, and though they may have been in the water a day or two, they were all found alive. Yet individuals cannot survive under water more than six minutes, and life in these balls can only be preserved by the mass revolving either by the continued struggle of the individual insect, or by an instinctive and orderly movement of the outer tier of ants.

**ANOTHER FOX WITH A WHITE FOOT.**—In a recent issue of *FOREST AND STREAM* I see an account of a red fox with white hind feet. He is not the only one, as I shot a large dog fox to-day ahead of my hounds whose hind legs were snow white to the gambrel joint.

**A WILD HOG—ONE-EYED AND EARLESS.**—The *Pittsburg (Pa.) Standard* of a recent date describes a new monster whose aspect have terrified that valiant traveler, Sir John Mandeville himself:

"A few days since Mr. W. Miller of Uniontown, who, like Nimrod of old, is a mighty hunter, and keeps a pack of fifteen hounds, captured an earless wild hog in the mountains of Fayette county. The animal not only has no auricular appendages, but no orifice in the head for the admission of sound, and is in consequence totally deaf. It has also but one eye, which, however, is large enough for two, being nearly two inches in diameter. The animal will weigh about 160 pounds, and is as ferocious as a bear. Mr. Miller will send it to the zoological garden in Philadelphia. Mr. Miller is a noted deer hunter, who follows his game on an Indian pony. He lately killed four deer on one excursion."

**ARRIVALS RECEIVED AT THE CENTRAL PARK MENAGERIE FOR THE WEEK ENDING JAN. 13, 1878.**—Seven Guinea baboons, *Cynocephalus sphinx*; one Patas monkey, *Cercopithecus ruber*; three Polar bears, *Ursus maritimus*; one Axis deer, *Cervus axis*; one hog deer, *Cervus porcinus*; two Indian antelope, *Antelope coriacapra*; one mottled owl, *Scops asio* presented by Mr. E. R. McCarthy, New York City; one horned owl, *Bubo virginianus*, presented by Mr. Ed. Marzaga, New York City. W. A. CONKLIN, Director.

**INDIA-RUBBER SPORTING GOODS.**—Such articles which induce to the comfort and health of the sportsman are numerous. These are fishing stockings, pants, boots, clothing, gun covers and blankets, all made of rubber. If the outdoor man manages to weather wind, sleet and rain in water-proof clothing, the indoor man finds comfort in drinking-cups and canteens made of rubber. Messrs. D. Hodgman & Co., of 27 Maiden Lane, corner of Nassau street, keep a full assortment of these most useful goods, and we can recommend these gentlemen and the articles they sell to the attention of our many readers. Messrs. Hodgman & Co. are also the leading people for the sale of rubber foot-balls, supplying most of the colleges with their balls.

## Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, RES. N. Y. HORTICULTURAL SOCIETY.

### GRINDELIA ROBUSTA AS A REMEDY FOR IVY POISONING.

IN a recent number of "New Remedies," published by Wm. Wood & Co., of New York City, I find an article copied from the *Scientific American* upon the use of *Grindelia robusta* as a remedy for oak and ivy poisoning, and as it is of special interest, particularly to your Western sporting friends, I have ventured to transcribe it, or at least the most interesting portion thereof. James G. Steele, of San Francisco, writes to the *Scientific American* that the *Rhus toxicodendron* is a very common cause of a great deal of misery and suffering in California, and contributes a paper on the properties of *Grindelia robusta* as a remedy, from which the following is taken: "Dr. L. A. Canfield (deceased), of Monterey, Cal., was the first," so Mr. Steele says, "to call the attention of the medical profession to the therapeutic action of *Grindelia robusta* in cases of 'oak poisoning.' Some twelve years since he caused to be published in the *Pacific Medical and Surgical Journal* a short account of this plant—its botanical features, habitat and medicinal value. My attention being thus directed to the plant, I procured specimens and prepared various pharmaceutical compounds containing the virtues of the drug, which were prescribed by the medical faculty of this city with sufficient success to warrant me in keeping a bountiful supply of the plant. It has been my practice yearly, during the months of May and June, to go into the rural districts and have gathered and dried in the shade one or two tons of *Grindelia robusta*." Here follows description of the manner of preparing the fluid extract, which is to be used as follows: "For poison oak eruptions, the best method is to mix one or two teaspoonfuls of the strong fluid extract of *Grindelia* with half a tumbler of cold or tepid water and apply freely, with a sponge or cloths dipped in the mixture, to the parts affected. One or two applications will often suffice for a cure; but if the disease has been of long duration, several days may elapse before entire relief is obtained. In severe cases of poisoning, cloths dipped in the solution may be bound upon the parts, and, if necessary, more of the fluid extract added. The most obstinate case of poisoning will be overcome by this mode of treatment, and immediately after the first application the most surprising relief is experienced. Another medicinal use has been found for *Grindelia* and its preparations. Asthma and kindred ailments have been made to succumb in a remarkable manner." Wishing to know something more of this plant, I wrote to my friend, Prof. J. T. Rothrock, of the University of Pennsylvania, whose knowledge of the medicinal flora of our country is excelled by none, and the following is his reply:

My Dear Doctor—*Grindelia robusta* is one of the composites found very commonly in the open grounds of California, as, for example, the place where we camped during our field work of 1875, near Santa Barbara, California. It is abundantly covered with a gummy exudation. The leaves are thick and the whole plant has a harsh, rigid appearance. It has been reported to be of value in asthma, and also in poisoning from the California poison oak, a species related to our own. I am not aware that it has been tried as a remedy for our own poison oak, though if of value in the one it would probably be also in the other. Local use of the fluid extract of *serpentaria* is, in my hands, a never-failing remedy for our own poison oak (see *Harrison's Essentials of Practical Medicine*) from which I learned its use.

Ever yours,

J. T. ROTHROCK.

In view of the facts above stated, I trust no apology will be needed for inflicting upon your readers this notice, as many of our sportsmen, owing to a peculiar susceptibility to vegetable poisoning are entirely debared from following their favorite pursuits. In this connection I may mention that I have no less than three botanical friends who have never suffered from the poison oak, notwithstanding the experiment has been frequently made of rubbing the hands, neck and face with the leaves and other parts of this plant. Here the old adage comes in—"One man's meat is another man's poison." Very truly yours,

H. C. YARROW, M. D.

**TO CLEAN BUCKSKIN GLOVES.**—Take half a pound of prepared chalk, half a pound of prepared alum, three cakes of pipeclay, half an ounce of oxalic acid, one-half ounceisinglass, one ounce pumice stone powdered, one tablespoonful of starch, six tablespoonfuls of sweet oil, two ounces of white soap. To be mixed in boiling water; the oxalic acid and prepared alum to be added last.

—The pineapple trade with the Bermudas has assumed great importance. During the shipping season just closed about 180 cargoes of pineapples were shipped to New York, Philadelphia and Baltimore. Ninety voyages were made by American vessels in the conveyance of this fruit to the United States. The freight earnings of these vessels is computed at \$100,000, and the amount realized by the sale of the cargoes was spent in the purchase of American goods for return cargoes.

**FLOWERS FOR HOME DECORATION.**—Set flowers on your table—a whole nosegay if you can get it; but two or three, or a single flower—a rose, a pink, a daisy. Bring a few daisies or buttercups from your last field work, and keep them alive in a little water; preserve but a bunch of clover, or a handful of flowering grass—one of the most elegant of nature's productions—and you have something on your table that reminds you of God's creation, and gives you a link with the poets that have done it most honor. Put a rose, or a lily, or a violet on your table, and you and Lord Bacon have a custom in common, for this great and wise man was in the

habit of having flowers in season set upon his table, we believe, morning, noon, and night—that is to say, at all meals, seeing that they were growing all day. Now here is a fashion that will last you forever, if you please—never change, with silks, and velvets, and silver forks, nor be dependent on caprice, or some fine gentleman or lady who have nothing but caprice and changes to give them importance and a sensation. Flowers on the morning table are especially suited to them. They look like the happy awakening of creation; they bring the breath of nature into your room; they seem the very representative and embodiment of the very smile of your home, the graces of good morrow. LEIGH HUNT.

**LUING FOR TREES.**—In pruning large limbs some composition should always be at hand to cover the wound. This will not only prevent its cracking by the cold in winter pruning, but will keep out the air and maintain the exposed wood in a sound state until it is covered with a new layer of bark. Many compositions have been in fashion abroad for this purpose, which under our summer sun and wintry frosts are nearly worthless, as they generally crack and fall off in a single year. The following is a cheap, and admirable application which we recommend to all cultivators of fruit trees: Take a quart of alcohol and dissolve in it as much gum shellac as will make a liquid of the consistency of paint. Apply this to the wound with a common painter's brush, always paring the wound smoothly first. The liquid becomes perfectly hard, adheres closely, excludes the air perfectly, and is affected by no changes of weather; while at the same time its thinness offers no resistance to the lip of the new bark that closes over the wound. If the composition is kept in a well-corked bottle, sufficiently wide to admit the brush, it will always be ready for use, and suited to the want of the moment.—*Dorring's Encyclopedia.*

—It is said that the French Government is about to take measures for the irrigation of the broad and fertile valley of the Rhone by means of the waters of that river. While there has not been recently any serious damage to crops in this region through drought, it cannot be doubted that the proposed step is a wise one, and will be productive of immense benefit to a large tract of country.

**A SIMPLE ORNAMENT.**—A pretty mantel-piece ornament may be obtained by suspending an acorn by a piece of thread tied around it, within half an inch of the surface of some water contained in a vase, tumbler, or saucer, and allowing it to remain undisturbed for several weeks. It will soon burst open, and small roots will seek the water; a straight and tapering stem, with beautiful glossy green leaves will shoot upward, and presents a very pleasing appearance. Chestnut trees may be grown in the same manner, but their leaves are not as beautiful as those of the oak. The water should be changed once a month, taking care to supply water of the same warmth; bits of charcoal added to it will prevent the water from souring. If the little leaves turn yellow, add one drop of ammonia into the utensil which holds the water, and they will renew their luxuriance.

—The manufacturers of Peerless Fine Cut present every customer of a ten-pound pall with a splendid seven shooter. As tramps are getting so bold now-a-days, this seems to be an opportunity to procure means of defence, and getting one's tobacco at the usual cost.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed signs of suffering, etc.

**THE ST. LOUIS BENCH SHOW.**—Everything points in the direction of an immense success for the St. Louis show. As we go to press we have received the following despatch from J. W. Munson, Esq., the secretary: "Thanking friends for their liberality, we must decline any more donations. Our specials already amount to nearly three thousand dollars, and we really have no places for more." Some of the gifts presented to the show are of the finest character. Mr. W. W. Greener, through the Simmons Hardware Co. of St. Louis, has just sent as a prize a superb forty-guinea gun, made in his very best style. That would be a gun to win. Mr. T. H. Scott has sent £10 sterling as a prize for the best setter, any age or strain, bred in America. This gentleman promises to be present at the show. Mr. Snellenberg, of New Brighton, Pa., gives a \$40 velvet shooting suit, for the best pair of pure Laveracks. Tiffany & Co. have presented a silver vase, valued at \$75 for the best setter, and Messrs. W. Read & Sons, of Boston, a Scott double express rifle.

Entry blanks of the St. Louis Bench Show may be had at our office which we will mail to applicants. Particular attention has been paid to the stalls for the dogs, which will be built in sections of five. In the centre of the rink a large space will be reserved for moving the dogs, and for the use of the judges. Many of the leading New York houses dealing in sportsmen's goods will have exhibits. The headquarters of the show will be at the Lindell House. We would call attention to the following: The A. & G. W. R. R. will give half fares to exhibitors from Salamanca or any other point on the line, to St. Louis and back, with passes for dogs. Every railroad entering St. Louis gives half fare, and the express companies half rates. If energy and perseverance make this

show a success—which it certainly will be—it will be in great part due to the untiring exertions of the secretary, Jno. W. Munson, Esq.

**ST. LOUIS BENCH SHOW.**—Mr. Lincoln, Superintendent of the Show, writes as follows: "The Rink, where the show is to be held, is admirably adapted for a bench show, as it is on the ground floor, with good ventilation, and ample space outside for dogs to have a good run. The dogs will all be provided with good, roomy stalls, made from clean-dressed lumber. Straw bedding will be used. The members of the association are all enthusiastic over the show, and, what is better, good, practical workers. Dogs sent by express without their owners will receive the best of care and attention, as special attendants will be allotted to them, overlooked by one of the members. A registry book will be kept, so that dogs sent will be exercised twice during the day and properly fed and watered. The Scott rifle, presented by Wm Read & Sons, will be given to the 'best couple of fox hounds.' The prize lists and forms of entry are now ready. Entries will close on the 5th of February."

**JUDGES AT THE ST. LOUIS BENCH SHOW.**—Dr. Davidson will act as judge for pointers and setters, Col. Skinner for hounds and Dr. Twaddell for spaniels, Chesapeake Bay dogs and non-sporting dogs. We shall be glad to distribute the forms of entry, which may be had on application at the office of the FOREST AND STREAM AND ROD AND GUN. Entries will positively close February 5.

--We beg to acknowledge receipt of the printed list of premiums and classification of dogs at the St. Louis Bench Show. There are ninety-two classes for dogs and eighteen divisions for sportsmen's goods.

**MASSACHUSETTS KENNEL CLUB.**—This club will hold its first regular bench show at Boston on March 26, 27, 28 and 29. Mr. Charles Lincoln will act as superintendent. The following gentlemen will form the Exhibition Committee: Messrs. F. B. Greenough, J. N. Borland, J. F. Curtis, S. W. Rodman, Luther Adams, J. Fottler, Jr., T. S. Sawyer, Jr. The exhibition will take place in the building formerly used as the Aquarium Gardens, Theatre Comique, etc., and latterly by Jordan, Marsh & Co. for their wholesale warehouse and store. It contains four floors, each having as much floor space as Music Hall. One floor will be used for sporting dogs, another for non-sporting dogs, and the third for an exhibition of sporting goods and pictures. Entries will be \$3; exhibitors free. Admission, 50 cents; season tickets, \$2. The prize list is now being printed in pamphlet form and will be very complete. Many of the prizes will be cups, the rest in gold coin. Very many special prizes have already been offered by sportsmen and dealers of the city. Mr. John Davidson, of Monroe, Mich., will act as judge of the sporting classes. Arrangements have been made with railway express companies to take dogs at reduced rates.

## FOX HUNTING EN REGLE.

RICHMOND, Va., Jan. 9, 1878.

EDITOR FOREST AND STREAM:

What sort of an animal is the "Annisled Bag," and has anybody caught one yet?

Almost every county down here has fox hunters, horses and hounds, but they always run gray or red foxes, the former in the lower country and the latter in the upper country. Dr. Paul Carrington, of Halifax, caught forty-two in one season—eighteen "straight," and all with his own pack. Drag-hunts and bag-foxes are rarely heard of—in fact, the only one I know of was when Col. —, of Hanover, having some guests at his house on a Christmas spree, started a little darkey on a mule with a dead fox, and the little "cuss," after following the route mapped out for him, got so numbed with the cold that the old mule took the bit in her teeth and started for home by the shortest way, which was right through Richmond. And then there was a chase sure enough! Here came forty hounds in full cry, and after them twenty riders, the whole concern rushing down Main street like a fanatic asylum out on a spree, and the people rushing out and yelling all along the way.

There is a hunting club in Richmond composed of a dozen gentlemen, among whom Col. R. S. A. is a most accomplished sportsman, and though not easy to keep up with in the hunting field, yet one would not desire a more agreeable companion. All the others are good riders, and, what is more, good fellows. And if the editor of the FOREST AND STREAM will direct any friend who loves real sport to any of the gentlemen whose names are in the enclosed private note they may enjoy a run almost any clear day during the season. The expense attending a trip would be but little beyond the ordinary cost of traveling; and though one must not expect to see any fanciful "make-ups," yet he will be certain to see a real fox hunt, and have a chance for the brush.

P. M.

We trust the readers of FOREST AND STREAM will all properly comprehend and appreciate the marked compliment extended to them from the Hunting Club of Richmond, through our esteemed correspondent. We do not remember any similar invitation to have been given through any public journal, even in the flush times of twenty and thirty years ago. Veteran readers of the *Spirit of the Times* assuredly will put the proper estimate upon it, and piously invoke the blessings of the good upon the venerable and honored brotherhood who thus extend the right hand of fellowship across the border. As for the present generation, it ought to study from the text-books of old memories and traditions, so as to revive the chivalrous intercourse of old-time sportsmen, and wipe the stains and blots of unpleasant war episodes from the escutcheon of the fraternity. The overtures of our Richmond friends seem to foreshadow the approach of a golden era of sport when a man's honorable training and culture in the manly arts will be the best credentials he can offer for admission to the Order of Gentlemen-at-large.—Ed. F. and S.]

**WHEELPS.**—Jan. 14, 1878.—At Fox Farm, N. J., Mr. Raymond's Dido, orange and white, five, by Mr. Geo. Raymond's (late Mr. Theo. Morford's) Bruce. All fine and hearty.

**BELLE.**—A correspondent is good enough to draw our attention to an error in a paragraph of our issue of Jan. 10, 1878, about the sale of Belle, out of Kirby, by Pride of the Border: Capt. Foster sold Belle when a puppy at usual rates (\$50, I believe), but after she was grown her owner, Mr. John C. Higgins, sold her for \$500 to a gentleman in Wilmington, Del.

**MARQUIS OF WINCHESTER.**—Marshall, Tex., Jan. 9.—I claim the name of Marquis of Winchester for my black and tan dog pup, with white feet and breast, by Gordon out of Flash, pupped Dec. 24, 1877. W. W. TURNER.

—The late Professor Sedgwick was in the habit of taking his dog from Cambridge to the hills of Cumberland every year, and on each occasion of his visit the dog regularly left him and took a journey of some hundreds of miles over the hills, to see another dog with which he had spent his youth.—From Professor Seelye's *Lecture on Evolution*.

**VISITS.**—Dec. 18, 1877.—Mr. C. De Rouge's (Milbourn, N. J.) Glen, by Pride of the Border, out of Dimity, to Mr. D. Olcott's pure Laverack Guy Mannering, by Pride of the Border, out of Fairy. Guy Mannering has twice received special prizes, amounting in value to over \$400, as best English setter born in the United States.

Dec. 26, 1877.—Mr. F. M. Campfield's (Morris Plains, N. J.) Dimity Second, by Pride of the Border, out of Dimity, to Mr. D. Olcott's pure Laverack Roderick Dhu, by Pride of the Border, out of Fairy.

Jan. 14, 1878.—Mr. La Montagne's Abbey, by Young Laverack, out of Raymond's Dido, to the Pure Laverack, Pride of the Border.

Jan. 14, 1878.—Mr. T. F. Anderson's (Newton, N. J.) field spaniel Judy, by Raymond's Badger, out of owner's Topsy, to Mr. Grover's imported field spaniel Sport.

My bitch Pet has visited Mr. Theo. Morford's Don, of Newton, N. J. My bitch Grace has visited Mr. Wm. Conklyn's Dan, of Ocean Grove, Long Branch.

E. F. MERRILLITT.

**HALF-MOURNING.**—Dog man: "Yes, ma'am. This here dog, ma'am? Real stock, nary white hair on him. Dirt cheap for you, ma'am. Take him for twenty-five dollars." Young widow: "Oh! the sweet, pretty thing! All black, you say, my man? Well, you must know that my dear, dear husband has been dead these last eight months, and I am thinking—'heigho!' of quiet colors again. Now, couldn't you get me a nice little doggy, with just a little white on him? A kind of half-mourning dog!"

## Sea and River Fishing.

### FISH IN SEASON IN JANUARY.

**SOUTHERN WATERS.**  
Pompano, *Trachynotus acrodon*. Grouper, *Epinephelus nigritus*.  
Drum (two species). Family *Scia*. Trout (black bass), *Centropomus niger*.  
Kingfish, *Mentidorsus nebulosus*. Striped Bass, or Rockfish, *Roccus tinatus*.  
Sea Bass, *Sciaenops ocellatus*.  
Sheepshead, *Archosargus probato-tailorish*, *Pomatomus saltatrix*.  
Cephalopods. Black Bass, *Micropentus salmoides*.  
Snapper, *Lutjanus caesus*. M. nigricans.

**FISH IN MARKET.**—Stock fair and in good demand. Bass 20 to 25 cents; smelts, 15; bluefish, 15; salmon, 30; mackerel, 15 to 25; Southern shad, 75 cents each; green turtle, 20; terrapin \$18 per dozen; halibut, 18 cents; codfish, 8 to 10; blackfish, 15; herring, 6 cents; flounders, 12½; eels, 15 to 18; sturgeon, 8; lobsters, 8 to 10; sheepshead, 25; scallops, per gal., \$1.50; soft clams, per 100, 30 to 60 cents; whitefish, 18; pickerel, 18; pike, 12; ciscoes, 12; hard crabs, \$1.00 per 100; soft crabs, per dozen, \$1.00; red snappers, 18 cents. Shad, in limited numbers from Florida, do not find rapid sale. Fishers prefer waiting for the North Carolina, which are larger and fatter.

**MOVEMENTS OF THE FISHING FLEET.**—The shore fleet have not met with a very great catch the past week; but the prospect is considered good. The fitting away of several more of the La Have and Bank fleets has given a little impetus to business, and the bankers which have arrived, have brought in good fares of halibut which have been sold to good advantage. There have been three arrivals, bringing in 131,000 lbs. of halibut. It is reported that the Fortune and Bonne Bay herring fisheries have proved a failure and been abandoned.—*Cape Ann Advertiser*, Jan. 11.

**NEW HAMPSHIRE.**—Nashua, Jan. 16.—Fishing through the ice for pickerel is the sport most in vogue now, and some fine strings have been taken. WEBB.

**MARYLAND.**—Cumberland, Jan. 12.—The black-bass fishing of the Potomac has gradually decreased, on account of the numerous dams built for feeding the C. & O. Canal. No suitable fishways are constructed. Before the floods the canal itself afforded better fishing than the river. HIXER.

**BLACK BASS FISHING IN JANUARY.**—P. S. Carr, of Fayetteville, N. Y., caught four black bass at that place one day last week.

**BASS FISHING.**—Cedarville, O., Jan. 10.—We have had most remarkable weather for about two weeks, warm sunny days, the thermometer at 63 and 65 degrees. It was so pleasant it was impossible to stay indoors, and not feeling like gunning, I got out my fishing rod and tackle, and thought I would take one more fish. I was greeted on all sides with, "Not going a fishing, are you? If I were you I would go out the back way, and not let any one see me," etc. I, myself, had serious misgivings as to my success; but when I came back in a couple of hours with a nice string of bass, I had the satisfaction of turning the laugh on them. The bass taken would average about ten inches. Used live minnows. Moon full; light wind from southeast, etc. I wonder if any of your

readers have been foolish (?) enough to go bass fishing in mid-winter, or as late as the 31st of December? I assure you that no one was more surprised at my success than was myself.

DAYBREAK.

—The United States Consul at Dundee reports that the total catch of seals in 1877 was 76,000, yielding 1,092 tons, worth, with the skins, £53,944, an increase of nearly £17,000 over the preceding year's catch. Eighty-one black whales and 935 white whales were caught, yielding 955 tons of oil and 424 tons of bone, worth together £92,925, an increase of £28,085 over 1876.

**FISH FROM SIBERIA.**—Siberian fish were eaten lately at the dinner of the Bremen Geographical Society. The fish had been packed in ice and forwarded from Tobolsk, and arrived in perfect condition after a journey of 3,000 miles, though eighty-three days on the road. "A moderate amount of energy and proper appliance," says *Land and Water*, "seems to be all that is necessary to bring our fish fresh to market from any part of the German Ocean and coast of Ireland."

## FISHING THROUGH THE ICE ON GURLEY LAKE.

EATON RAPIDS, MICH., Jan. 1, 1878.

EDITOR FOREST AND STREAM:

Last winter a party, consisting of Elder Phelps, Dr. Case, Ellis E. Shaw, Chas. Dodd and myself, all members of the Eaton Rapids Boat and Gun Club, went into camp at the celebrated Gurley Lake, eight miles from this place. We arranged our bed by placing a pole on the ground beside one of the tents crosswise, and putting in a good lot of straw, which we obtained of a farmer not far away, then we spread on about fifteen or twenty blankets, robes and comfortables. This tent was our sitting and sleeping-room, and was heated by a sheet-iron heater; the other we used for a dining-room and commissary department. The morning after our arrival we commenced our *modus operandi*, cutting holes through the ice with an ice chisel and setting lines. We started at the south end of the lake and set north, using live minnows for bait. We had set for half a mile, leaving a line about every ten rods, when I had occasion to go back over the line, not expecting to have a bite so soon. But I was surprised to see one of the floats standing up as straight as a cob. I hastened to the spot and had the satisfaction of landing a fourteen-pound pickerel. Within one hour from that time we had four of the monsters lying side by side on the ice, the first one being the smallest of the lot, the others running as high as sixteen pounds. Some say they were muscalonge, but I am positive that they are the real lake pike or pickerel (*Esox lucius*). We caught one on the same lake the year before that weighed over seventeen pounds. We also took a goodly number of smaller ones, which I shall not stop to describe. I will say right here, for the benefit of those who believe in the wind having anything to do with fish biting, that we stayed on the lake about a week, and had wind from every direction, and no day or time did we have as good luck as we did with the east wind, which is called an ill wind. As far as I am concerned, I don't care which way the wind blows so long as the fish bite good. I once witnessed a large pickerel in the pursuit of its prey; it was on the ice at Portage Lake, Jackson County, this State. In this instance we had a hook baited with a live sucker that we caught while we were after minnows; it would weigh about half a pound, making a good-sized mouthful. Seeing the float up I at once repaired to the spot, when I found the fish had let go. So I spread down a blanket and laid me down upon the ice to watch proceedings. Presently there came a sort of phosphorescent light, which filled the water as far around as I could see, and finally the head of a monstrous pickerel appeared, not over three feet below my face. He stopped and gazed at the sucker, who was showing great signs of fear. After a short space of time he snapped his jaws together, then, with open mouth and eyes glaring and sparkling like balls of fire, he made a grand rush for said sucker, catching him near the tail, scraping off the little scales, which threw out a shining light as they descended to the bottom. After holding the little fellow awhile he let him go, and then the fun commenced; round and round the hole went the little sucker, having about fifteen feet of line to play on, with the pickerel in hot pursuit. Finally, the pickerel, by a bold manoeuvre, changed his course and made a rush straight for the sucker. Catching him by the head he wrenched him from the line, not having the hook in his mouth, the hook being fastened to the sucker just under the skin near the dorsal fin. He sailed off in triumph with his prize. Our week at Gurley Lake soon came to an end, as all weeks do, and we broke camp and came home. Some object to camping out in the winter, but I have made a practice of doing it for years, and have yet to take my first cold by camping, either summer or winter. With good warm clothing, plenty to eat, lots of fire-wood, a good bed, and the fresh and bracing morning air to stir one's blood, who could not enjoy camping in the winter.

PETER DENNIS.

## HINTS ON BASS FISHING.

GLENS FALLS, N. Y., Jan. 6, 1878.

EDITOR FOREST AND STREAM:

I have read to-day, for the first time, the FOREST AND STREAM of Nov. 15, and without reading subsequent papers to see what answer, or answers, "Splasher" has drawn forth in regard to "conditions for bass fishing," I will give a few extracts from my note-book, as well as some personal experience in the same connection. Like the crab, I will advance backward:

August 1, 1877.—I caught two bass, weighing 6 lbs., 4 oz., and 7 lbs., 14 oz. The smaller one was landed at 5:30 A. M., and the other at 6:10 A. M.; the bait, yellow perch about five inches long. Wind very slight, and in the northeast; sky cloudless. Although using two rods in the boat, both fish were caught on the same rod, which weighed 10½ oz., single gut leader, and Kirby hook. I do not know the number, but like a No. 2 O'Shaughnessy, tied on a single gut. The place, Long Pond, Warren Co., N. Y. When dressed, the stomachs of both fish found perfectly empty.

July 21.—Fished Round Pond, one-half mile from Long Pond, with a friend, who, at 6 P. M., caught a bass weighing 4 lbs. Wind north of east; sky partly cloudy; bait, small perch—by small I mean from four to six inches. On the same day, in Long Pond, two bass were caught by one person weighing 7½ lbs. each; bait said to be gold shiners, but believed to be small perch—fishermen will make mistakes. These two fish were caught in the morning, about 8 o'clock, by a Mr. S., who was fishing with two hand lines. When he landed one fish, he discovered that his other line was gone. Half an hour later, thinking he saw the wooden reel to which his line was attached dancin' on the water, he pulled anchor, and rowing to the spot, found he was mistaken. But, while looking to locate his old position, he did see the piece of wood

come to the surface, and getting hold of it, found the fish still fast, and killed it.

September 20, 1876.—Julius Seeley caught in Long Pond a bass weighing 7 lbs. 10 ozs.; half, small perch. Do not know condition of weather. September 7, 1876.—Fished Long Pond. When first anchored, about 6 A. M., water smooth as a mirror. Anchor hardly down before I got a strike on my 8 oz. bass rod that indicated a large fish. When nearly 100 feet of line had been deliberately taken and I was forced to strike without the fish once halting to gorge the bait, I was gratified to see a large fish show himself twice, at the end of my line. After getting him nearly to the boat, he made two runs, each time taking the most of my line. When I finally reeled him close to the landing net, he jumped from the water, and spit out the bait—a five-inch perch. Upon examination, I found that the bass had swallowed the bait only to the hook, which was crosswise of the perch under the back fin; and there held on and made his fight without once being pricked with the hook, and it was only the proximity of the net or boat that made him repudiate. The fish was estimated by the boatman, Julius Seeley, to weigh over six pounds. I did not weigh him. Later in the day there was a slight breeze from the northeast.

September 17, 1876.—Went to Long Pond. Got on the fishing grounds about 7 A. M. Wind N. E. E., and blowing a gale. Anchor would not hold. While looking for heavy anchor on shore, Julius Seeley, who anchored on same ground as I had drifted from, caught a bass weighing 6½ lbs., when his anchor rope was broken, and he, too, came ashore. He used perch for bait. The day was pleasantly warm, and sky clear. August 12, 1876.—Fished Long Pond. Largest bass 3½ lbs. Used silver shiners, had no perch of suitable size for bait. Wind east of north. The fish was caught in the middle of P. M., on grass bottom.

I fish in water from fifteen to twenty feet deep, and anchor between a patch of weeds and deep water, to intercept the bass on their way from the deep, cool water to the weeds, where they find the small fish on which they break their fast.

Fish in such a place in the morning and evening for big ones, and the balance of the day, if you choose to sit in the sun, find grass bottom and go for the small ones, three-fourths of a pound upward, with the chance of once in a while striking one of two or three pounds. Put on a float the length of your rod from the hook, care being taken not to put on too heavy a float, and use a light sinker. With a heavy float or sinker your bait is soon used up. In catching perch for bait, set them in shallow water near the shore; those caught in deep water are darker in color, not so conspicuous, and will not live as long as you are putting them on the hook. A shallow water perch will live longer than a minnow, and there is not the danger of throwing them off the hook. For small bass, minnows are as good as any other bait fish, and tougher than gold or silver shiners. A sucker is equally good, but the fishing in different waters will differ even with the Oswego bass, to which I refer in the foregoing.

When you come to a black bass that grows in rapid water, you must "Stand down the hall." He is a gentleman of the first water, and entitled to respect. He wants a bill of fare every day, and he makes his own selection. Don't go fishing on Saturday with Friday's menu alone; if you do, commence at the bottom or the top, and go through it, you may strike him somewhere between *huitres* and *cafe*, and—you may not.

If you fish with bait, go to some bass river, and where the current is strong at the foot of rapids, with comparatively smooth water—perhaps there is a bend in the river, and the channel is deepest just off shore. Anchor just above the "hole," in the early morning. If the current is not too strong, put on your float so your hook will almost touch bottom. Stick your hook through the tail of a fresh water crab or crayfish, throw it overboard, and look out for a squall. If the current carries your bait on the surface, take off your float and drop your bait on the bottom. "But my crab has got under a stone my hook is fast." All right, don't try to pull it out, light your pipe, but be quick about it, get hold of your rod and admire the beauties of the morning, or—By theobonies of the Imperial Bacchus! what a break he made! He noted that crab out of his hole in a hurry, and he is as full of business as St. Nicholas the night before Christmas. He is a Cash-in, and now it is the freedom of the black-waters from which he came, or into port dead. (Brother H., this is owing to the turkey I ate for dinner, and if the higher powers let me off with "six months," I won't be found here again.) A man has his hands full, or four of a kind, to beat a black bass. In such a place as I mention above, a bass will make his presence known at once, for that is what he is there for, to feed on what comes down the stream. I have found crayfish the best bait, and most certain to take in rivers with rocky bottoms. When you have fished the first place and it is 10 o'clock, go ashore and rest in the shade until 4 P. M.; then joint your fly rod, and from the boat, cast toward the shore and over the pools, and give the bass their dessert.

In 1872, fishing with Col. Jephth Garrard, I was casting with three flies on my leader, and saw a small bass rise close in shore at my stretch. I hooked him, and he did not show again, but became suddenly a two-pound bass instead of a one-pound fish, and he soon increased still more. As we were fishing below a fall and above some very rough water, and I was using an eight-ounce fly rod, we had to shoot the rapids or break something, and shoot we did. When the landing net went under that bass he was three base, and weighed nearly 4½ pounds. In this connection let me say that in November, 1876, the types of F. AND S. made me say that Col. Garrard caught a black bass on his fly rod weighing three pounds, and it was the largest of which I had any knowledge caught in the Hudson. If you will please make that bass weigh five pounds (don't use shot, or you will infringe on the patent of Mr. John Van Bu-kik of Washington) the statement will be correct.

Much of what I have written will be old news to many, but if we get at the true inwardness of bass fishing, those who know it all must be patient with those who don't, while they air their ideas; and, too, we must make notes of days that are drawn blank, as well as those we mark with a red letter.

It would almost seem as if the large bass go in pairs all the summer. Seeley, that I mention above, while fishing a year ago last summer, caught, at two different times, two bass that weighed about six pounds each, and once, one of about the same weight, and lost another. I did this last myself in Lake George in 1875. You see that on the days when the wind was noted, it came from between north and east.

If "Splasher" will send me his address, I will be pleased to send him some tied hooks that, I think, are the best bass hooks used; and if he will come here and catch some bass that I will show him, or tell me how to do it, I will make my thanks loud and strong, if "my left lung is nearly gone."

I agree with "Splasher" that a bait fish, of whatever kind, must be lively; and it needs looking to frequently, if it is anything but a perch, which I consider the best bass bait—and I am not alone in this opinion—for large bass. A perch will live longer than any other fish; is tougher; and fishing with two rods, on one a perch, on the other a minnow or shiner, or gold shiner, or silver shiner, the perch will be preferred. For large bass use large bait. If one of your minnows gets cut or mutilated in any way, the jig is up for that bait, unless the bass are very hungry. I never caught a bass on a dead fish—I don't remember that I ever tried. You can do as you like with the pronoun in first person singular that occurs so often, it is beyond me. GLENS FALLS.

—A few gentlemen wishing to join a first-class shooting and fishing association can hear of a favorable opportunity by addressing GALE, this office.—[Adv.]

## Game Bag and Gun.

### GAME IN SEASON IN JANUARY.

Hares, brown and gray.

Wild duck, geese, brant, etc.

FOX FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocet etc., coming under the group *Limicola*, or Shore Birds.

NEW HAMPSHIRE.—*Nashua*, Jan. 16.—Weather favorable for protection of quail; grouse abundant; good bags the last month. Not so much fox and rabbit hunting as usual at this season owing to the bare ground. WEBB.

MASSACHUSETTS.—*West Newbury*, Jan. 7.—Whistlers numerous at upper end of Plum Island. Some little game in woods about here. TRAIL.

PENNSYLVANIA.—*Mahonington*, Jan. 7.—Shooting season just closed. Largest bag of quail in county reported was fourteen brace to two guns. A fair breeding stock left over. A.

Sharon, Dec. 29.—The Messrs. Cole, who have just returned from Michigan with 21 deer and one bear, report game plenty there. Good bags of grouse and quail have been made by several of our sportsmen. ELMER.

MARYLAND.—*Cumberland*, Jan. 12.—Quail have been very plentiful this season notwithstanding that numbers perished last winter from cold and want of food. We have also had good woodcock shooting. Some of the largest deer ever captured in these parts have been killed a few miles west of us in the Alleghenies and the adjoining counties of West Virginia. Wild turkeys are very plenty, and pigeons (in the glades on the E. and O. R. R.) so thick that there was no sport in shooting them. The squirrels last fall in their emigration destroyed a great deal of grain; as high as six and eight being killed on one shock of corn before the others scampered off. So plentiful were they that they would swim the river and come into the city, numbers being killed in private yards. Panthers seem to be rather plentiful. They are quite numerous in Garrett County (the glades adjoining us), and some were killed by sportsmen last fall. HINER.

FLORIDA.—*Lentes Lodge*, Jan. 1.—Several enthusiastic sportsmen are at Enterprise, they are making good bags of quail and ducks. Owing to warm weather, ducks not so plenty as usual; red-heads, blue wing teal and golden eyes afford fair sport. Quail not so plenty this year as last, owing, I think, to the very wet summer killing the young ones. Deer and turkeys very plenty, saddles only 8 cts. per lb. The fast steamer, *Wate Lily*, that formerly ran on the Harlem River, now carries the mail on the Upper St. Johns. She seldom varies ten minutes in her schedule.

St. Augustine, Jan. 5.—Snipe, quail, and deer shooting good.

TEXAS.—*Galveston*, Jan. 4.—Game abounds with us this season. F. S. C.

MISSOURI.—*Powellton, Atchison Co.*, Jan. 1.—The shooting here in the Northwest has been simply elegant this fall. Chickens and quail in abundance. Old Sol Ohl, the champion snipe hunter, has made some huge bags. E. T. P.

OHIO.—*Woodstock*, Jan. 11.—Weather favorable for the quail crop next season. T. M. O.

SOUTH-WESTERN OHIO, Jan. 10th.—Our hunting season has just closed; game has been exceedingly plenty, partly accounted for from the fact that we were restricted from hunting for two seasons past. Quail were more numerous than any season in my recollection. The season lasted one and a half months; the weather during that time being all that could be desired, no snow having fallen, for which I am very thankful, as it prevented the wholesale destruction of game by "pot hunters." The farmers here have had a very severe attack of the "posting fever," and are swearing vengeance on any one hunting on their premises. About a half dozen sportsmen have been arrested, most of them pleading guilty and paying their fine of from \$7 to \$10 and costs; one, a market hunter, not pleading guilty, was bound over to court in the sum of \$100. There has been some stock crippled too, much cow shot in the upper. But I find there is no hunter these farmers detest as much as the market hunter; one such person in our neighborhood has done more to set the land-owners against hunters than all the sportsmen put together; he shot between five and six hundred quail and shipped to city market. There is talk of passing a law this winter not to allow any hunting for five years—we tell them quail will be so thick they will bite them! Some of our sportsmen made good scores during the season—two, three, and some four hundred quail; a fair shot could bag from fifteen to twenty-five quail in a single day's shooting. "DAYBREAK."

MICHIGAN.—*Detroit*, Jan. 12.—W. Smith and R. Gay yesterday bagged eight rabbits out of nine started. RED RUFFS.

WISCONSIN.—*Debron*, Jan. 5.—Game this fall was almost totally defunct, owing to the fine weather which prevailed during the month of November. Few mallards and very wild; no good bags made. AMATSBUR.

A GOOD MANY SNIPES.—The New Orleans *Picayune* is responsible for what it calls "the greatest shooting exploit ever performed in this country." On the Teche snipe are abundant. A gentleman owning an estate there, so our authority affirms, is in the habit of shooting on the wing 300 snipe a day. Late in this sportsman in six days killed 1,900 snipe. Allowing six hours per day to the hunt, this would give about a snipe every minute. As our readers have been frequently informed by our Southern correspondents, snipe are found in enormous quantities in Southern Louisiana. Conceding the mere ability of the person who shot all these snipe, still we doubt as to his possessing true sportsmanlike proclivities. Such wholesale slaughter we cannot mention with pleasure.

—The Cuvier Club of Cincinnati gave its usual reception to its friends on New Year's Day. Very numerous invitations had been issued—for the Cuvier does not throw open its doors to mobs—and the elite of the city looked in upon its cosy quarters and did justice to the elegant cuisine. The callers numbered about a good regiment—some 800 persons. Its own membership is about 400, and the future of the club is promising. R. E. DUCAIGNE.

AUDUBON CLUB.—*Chicago*, Jan. 9.—Editor *Forest and Stream*—The Audubon Club, of this city, held their annual meeting Jan. 8. The Secretary's and Treasurer's reports show a membership of forty names on their rolls, no debt, and a comfortable cash balance in the Treasury. The following officers were elected for the ensuing year: Chas. Kern, Pres.; W. T. Johnson, First Vice-Pres.; Greene Smith, Second Vice-Pres.; Geo. Barnard, Sec.; Abner Price, Treas. Board of Directors—S. H. Turrill, Thos. Stagg, J. J. Gillespie, Chas. Morris, N. C. Hinsdale; Dr. N. Rowe, Kennel Manager. Action was taken in regard to the State Sportsmen's Convention, to be held in June, and the following delegates and alternates were appointed: Delegates—Chas. Kern, S. H. Turrill, Abner Price, N. C. Hinsdale, W. T. Johnson. Alternates—Dr. N. Rowe, Chas. Morris, Chas. E. Felton, Alex. Cook, Thos. Stagg. The Board of Directors were instructed to call a club shoot at the earliest practicable moment. There is a prospect of an early match at glass balls—teams of eight or ten men—between the Audubon and Chicago Clubs. G. B.

SOUTH BROOKLYN SPORTSMEN'S CLUB.—At a meeting at their rooms, 933 Third Avenue, S. B., the 7th inst., the following officers were elected: Francis Juif, Pres.; John Marony, Vice-Pres.; Paul A. Bassinger, Secy.; Gus Boyesen, Treas.; John Castlehune, Sergeant at Arms.

FERNISBURG (VT.) SPORTSMEN'S CLUB.—The officers of this efficient club who have been elected for the ensuing year are: President—Walker Field; Vice-President—M. E. Hall; Secretary—R. E. Robinson; Assistant Secretary—Wm. C. Bradbury; Treasurer—Byrn W. Field; Executive Committee—J. A. Cadwell, Reuben Parker, F. A. Woodbridge, Daniel R. Young; Chaplain—Brevet-Rev. Joseph Birkitt.

OUR NEW YEAR'S DUCKS.—We are frequently called upon to acknowledge the receipt at this office of the kindly remembrances of our friends. All kinds of fish and game have graced first our sanctum and then our table. Visions of a like savory gift came before us, as New Year's eve, we opened a box sent us by M. C. Wedd, of Rochester. But, alas! the ducks were unpalatable—wooden; in short, stones for bread. Our thanks are due, but what can we say with an empty stomach? Wooden decoys are all very well in their place, but don't tantalize a hungry editor by such inedible gifts.

LRA A. PAINE AT PROVIDENCE.—Mr. Paine has just closed a most successful engagement in Providence, at the Opera House, where he has been smashing the glass balls for the last week. The sportsmen generally in Providence, to whom glass ball shooting was novel, have expressed themselves as delighted with this new amusement, and in Rhode Island glass ball shooting will soon be the rage.

WHERE THE WILD PIGEONS ARE.—Correspondents tell us that the pigeons were roosting on Tionesta Creek, east of the Allegheny River, in Forest and Warren Counties, about a month ago. A week ago they were roosting about six miles back of President, Venango Co., Pa. Several flocks flew over Petroleum Centre within the last few days. Trappers could have caught them here by thousands during November and December as they would come down to tame birds, and they flew in vast numbers mornings and evenings. Pigeon hunting and good sleighing seldom come together.

STILL ABLE TO SHOOT A LITTLE.—On Saturday afternoon, Jan. 19, Capt. Bogardus will shoot a match with Dr. Talbot, a well-known amateur shot. Capt. Bogardus gives Talbot 50 broken balls in 100, Talbot to shoot at 50 balls, Bogardus 100 balls to be sprung from one trap, screened from view of the shooter, and arranged to throw the balls each time in a different direction. Both to use the same gun, not to weigh more than 7½ lbs. Capt. Bogardus will at any time shoot a match with Paine, giving him some odds.

W. & C. SCOTT & SONS' GUNS AT SCHUYLER, HARTLEY & GRAHAM'S.—Such admirable specimens of arms made by W. & C. Scott & Sons, as were exhibited to us by Messrs. Schuyler, Hartley & Graham, we have rarely ever seen before. In some respects these guns were exceptional as to weight and bore. Fancy breech-loaders 5½ lbs. to 5½ lbs., 26 to 28 ins. long, with a 20 bore, and loading with a shell charged with 2 to 2½ drs. of powder and ¼ of an oz. of shot! Such beauties we are comparatively ignorant about in the United States where heavier guns are more in demand. Such small bores and light weights are, however, coming fast into use in England. As they are modified choke bores, of course they hit hard and true, but may require greater skill on the part of the shooter. These small bores may be considered as the refinement of sport. The barrels are of the finest laminated steel, with bar and rebounding locks, top snap and double bolt, extension rib, large head strikers, patent fire-end fastenings, pistol grip, with horn heel-plate. As to exquisite finish and beautiful work, these guns are unsurpassed. All that patient and conscientious skill can do for barrels, locks, breech movement, has been expended on these arms. Messrs. Schuyler, Hartley & Graham exhibit a Scott & Sons' gun of heavier weight and bore, an 11 lb. gun with a 10 bore, 34 in. barrel, which was made specially for the Paris exhibition. This arm is, undoubtedly, the choicest gun we have ever set eyes on. Perhaps Messrs. Scott & Sons never built a more perfect arm.

WITH A REMINGTON RIFLE.—A correspondent from the State of New York writes as follows: "I shot a deer at sixty rods with a Remington rifle, 38-100 short cartridge. I put the ball through and through the deer. I am sure to kill whenever I get a ball from a Remington into a deer. He always drops in his tracks."

FOND OF THE WOODS.—James P. Williams, Esq., Cashier of the National Bank of Schoharie, is an ardent sportsman. For the last twenty-two years Mr. Williams has not missed fishing or hunting in the Adirondack region. His sojourn is generally of a month. It speaks well of Mr. Williams' love for a life in the woods, and we hope he will long be able to seek the sylvan glades of John Brown's track.

THE FINEST TURKEY OF THE SEASON.—Messrs. E. & A. Robbins, Fulton Market, have this week sent to Allen Gilmore, Esq., of Ottawa, Canada, by our order, one of the finest wild cock turkeys we ever saw. It is the selection of three weeks' consignments, and was chosen for its size and plumage, it being intended for a Natural History collection. Its weight was ponderous, its beard patriarchal, and the sheen of its bronze transcendent. Messrs. Robbins declare it to be the finest specimen received by them in many years, and we feel indebted for the pains they have taken to secure what was wanted.

RECOIL.—A correspondent writes [us] the following in regard to some theories of recoil, which have found publicity in our columns, and which theories we by no means indorse:

PHILADELPHIA, Jan. 5.

EDITOR FOREST AND STREAM AND ROD AND GUN—I have been very much amused at some of the articles on recoil that we have had lately, and which claim that the projectile has no influence on the recoil. Have any of our friends ever got two loads of shot into one barrel (in former muzzle-loading days) and not have their shoulder sing out on the subject feelingly? If they will fasten a rifle on a block, attach to it a spring balance made self-registering so as to take the recoil, and then fire it with a bullet, and then without a bullet, they will be satisfied that the weight of the projectile is a very important feature in recoil.

N.

A QUESTION TO "STRAIGHT-BORE."—Editor Forest and Stream.—I would like to ask "Straight-Bore" why, if the recoil takes place after the ball leaves the gun, a heavy gun gives, with the same charge of powder and lead, so much better penetration than a light one? Yours truly,  
Washington, N. J., Dec. 31, 1877. E. N. MILLEN.

CAPTAIN BOGARDUS.—The *rentree* of this celebrated shot at the Tivoli Theatre after his wonderful effort of skill and endurance drew a very large attendance. Though still suffering somewhat in the muscles of his right arm, during his special performance not a miss was made. The captain broke ten singles thrown from behind the screen; next broke fourteen balls in the minute; after that he pulled three balls, smashing them, and concluded by making a neat double. The Tivoli Theatre was crowded on the occasion, and the captain for his skill and gallant mien was rapturously applauded. Captain Bogardus will shoot during the present week at the Tivoli Theatre.

—A correspondent corrects our statement that the close season for quail in Maryland begins Feb. 1. We took our information from the law as published in the current number of *Fur, Fin and Feather*, and are indebted to our correspondent provided our authority is wrong.

## \$20,000 CHALLENGE TO BOGARDUS AND DR. CARVER.

### EDITOR FOREST AND STREAM:

Being desirous of giving an exhibition of my skill with the shot-gun, I will offer the following challenges: 1st. I can break more glass balls than any man in the world. (I say this because every one else does), 2d. I can break more glass balls than there are in the world at this present time. 3d. I can break more balls at 25 yards standing on a No. 8 wand than any man in the world can at 30 standing on horseback. 4th. I can break more Winchester rifles, or rather break more balls with one at 20 paces, than Dr. Carver can at 10 with a bow and arrow. Rhode Island rules, plumb trap; each man to trap and gather his own balls. Parties meaning business will apply soon, and arrangements will be made of once with the U. M. C. Co. for several million shells. Mr. Hobbs will be only too glad to furnish them.

The Ladin & Rand Co., also Hazzard, Dupont & Dittmar, will go into estates at the mere thought of furnishing free all the powder necessary, and Ely Bros. will stand a sight drag for a half ton of pink edge wads. Tatham, Otis LeRoy and the Sparks estate will, no doubt, get into a lawsuit as to who will furnish the most shot; but as this is a matter of no moment, we will not discuss it here. I will say to the gun trades that I have a gun—in fact, several of them—and therefore will anticipate the thousand and one offers of choke-bores, taper-bores, cylinders and belt-muzzles that are to be made. I shall be delighted if my friend, Geo. Haydon, of Jacksonville, Ill., will consent to be present to prevent any "crookedness," and if "Glean" will be on hand to settle legal questions, he will be entitled to traveling expenses and thanks of

Philadelphia, Jan. 15, 1878.

## SPORTING NOTES FROM THE LOWER COUNTIES OF CALIFORNIA.

### EDITOR FOREST AND STREAM:

In the latter part of December, the most attractive sport is the pursuit of wild geese. These are fairly domiciled in the grain fields and water courses of the lower counties, and growing immensely fat from feeding on the young, tender barley. They are approached in the feeding on the wagon or by saddle, the gunner in the latter case screening himself from view by walking close to the horse on the opposite side from the game. In the warm, sunny hours of midday, the flocks of the Santa Anna River are well covered with the immense gray geese, whose summer home is in the Arctic region. There are also the smaller varieties which have neck and wings of pure white.

Starting out any of these fine winter days, with lower limbs well encased in water-tight boots and leggings, with a good breech-loader and retriever, a day can be well spent among the miniature islands of this river. The latter seem specially adapted for the fowler. The current makes its way in numerous shallows, nowhere over the foot in depth, flowing over a dazzling white quicksand, the latter being not in the least dangerous to traverse, as it rapidly packs in a hard mass after a few footsteps in the same place. It is on the wide, shallow flats, conveniently sprinkled with hummocks or miniature islands of tules and bushes, that the geese and mallards bask themselves in the midday sun. Decoy shooting for the former has not been practiced here as yet, but as they have their favorite haunts on the river, and as observation has shown me that large numbers will frequently alight where one or two are occupying a favorable position, it appears probable that if the above method was practiced in such localities, with several tame geese as decoys, or wild ones stuffed, great numbers could be shot down. In cruising along the river, decoys are frequently met with which cannot be approached unseen. In such cases, substituting shells loaded with swan or buck shot, and emerging into plain view, walking quickly toward them, the writer has frequently got within 50

or 100 yards before their reluctance to move was overcome, they generally leaving, as a penalty, one or two of their number behind. Mallard, and several other varieties of large ducks, are quite plentiful; also the diminutive but ever-welcome teal, the above getting in fine condition feeding on the wild celery which grows luxuriantly in these parts. Just scarce enough to make them highly acceptable when bagged, are the Wilson snipe, which are eagerly sought after by San Francisco epicures. Before closing I would state that quail, as usual, are very numerous, and a day among the Arroyos, to the south of R., or on the brush plains to the north of the Southern Pacific R. R., will generally bring you a well-filled bag. Unfortunately, the services of our canine friends are not as necessary here as in the East, owing to the generally open nature of the ground, thus depriving us of one of the chief pleasures connected with bird hunting; but since the brush plains above mentioned are found to abound with the quail, their use and necessity become more apparent. Two Englishmen, shooting for the San Francisco market in the above-named locality with dogs, are reported to have brought in forty dozen as the result of one day's work. As for larger game, our old friend, Uncle P., was down from Mount San Bernardino a few days since, reporting burs scarce, but deer very plenty. Engaged in hunting stray stock recently, he had brought down three during the day while in the mountain valleys to the south. A regular hunt, with horses and dogs, a somewhat unusual occurrence here, resulted in the capture of seven fine deer.

J.

## ANOTHER FUSILADE.

### MR. EDITOR:

So many correspondents of the great quadrilateral (F. and S. R. and G.) have been firing off their guns at recoil theories, merits of guns, etc., that I feel surcharged myself, and seek relief by firing my own gun—squib. On the recoil theories I simply make this suggestion, if recoil does not take place until after the charge has left the muzzle of the gun, why is it that a rusty or rough bore will kick like a mule with a small load, and no recoil be perceptible after the bore is emerged smooth?

In regard to altering muzzle-loaders to breech-loaders, any gun can be altered to use brass shells, but for paper shells the breech of gun must be of a certain thickness. The method proposed by your correspondent, S. L. Hart, is defective, as the screw holes in barrels are an element of weakness. The lugs should be brazed or silver soldered, which will make the joint as strong nearly as the metal itself. Soft solder will not do. I have knowledge of one instance in which the solder gave way, planting the shell in the sportsman's face, and making its mark for life—happily the eyes were not permanently injured. The gunmakers charge from \$40 to \$100 to convert a muzzle-loader to a breech-loader. What the actual cost of the job is I will not pretend say, but have been assured by an expert that \$85 will pay for a first-class job, small breeches, centre fire, etc. If gunmakers can and will do such jobs for \$25, and will let it be known, they may be assured of thousands of good muzzle-loaders to convert. At present prices—unless a man has an extraordinary fine gun—it will not pay to have it converted, as he can buy a new breech-loader, of good material and finish, for less than the cost of converting the old gun. If money is no object, buy a breech-loader, and lay your old gun on the shelf. If impetuous, let me whisper in your ear that you can make as good a bag with your old friend as with the best \$300 breech-loader ever imported, and if out for an all day shoot, have a lighter load of ammunition to carry. The chief advantage of a breech-loader is its convenience in charging ammunition, and the ease with which it is cleaned. I have both systems in use, and know whereof I write. A new gun can be sold at retail for from \$50 to \$75 that will shoot as well and wear as long as a \$300 gun. Any amount above this is simply so much paid for the gratification of the eye, and adds nothing to the real value of the gun. The \$50 to \$75 gun should have laminated steel barrels and fine quality steel coils. Laminated steel will outwear two twist or Damascus barrels. A fine Damascus barrel is beautiful, but I have never seen one that would keep smooth inside without the constant use of emery. Indeed, as far as a fine surface is concerned, I think that homogeneous steel, such as Remington puts in his \$45 guns, will wear better than the finest Damascus ever made. Will not some one who has the conveniences—Remington, for instance—experiment with homogeneous steel, and relieve our minds of all doubt as to its strength? Can barrels of homogeneous steel be made as light as twist or Damascus, and stand the same proof charges? Is there any danger of the metal becoming crystalline? A few words as to the case of muzzle-loaders: Always clean your gun before putting it away, and occasionally remove the breeches and polish the interior with fine emery. If you use the old style nipples, throw them away and buy a pair of reversed cone nipples, you can then use coarse powder, and not be troubled with misfires, thereby making better pattern with increased penetration and less recoil. For a gun to carry all day, use a 16 to 14-gauge, 6½ to 7 lbs. weight. Such a gun, with 2½ to 2¾ drs. coarse powder, and ¾ oz. No. 8 American shot will fetch anything at forty yards, if held right. A 10-gauge gun would require at least 3¼ to 4 drs. powder and 1½ oz. shot to be equally certain at the same distance (both guns to be same style boring), and if of no greater weight the recoil would be demoralizing.

TEN BROOK.

## PIGEON MATCHES.

BROOKLYN DRIVING PARK—Parkville, L. I., Jan. 9, 1878.—Pigeon shooting; monthly handicap contest of the Fountain Gun Club for a gold badge. Twenty-four contestants at 7 birds each; 80 yards boundary; 1¼ ounces of shot; H and T traps; the club rules to govern.

† Divided the money.

Referee, Mr. Charles Dexter. Time of shooting, two hours and forty-five minutes.

PENNSYLVANIA—Germantown, Dec. 26.—Match between Greenwood, of this city, and J. Wistenmeyer, of Phila.; 21 birds, 21 yards. The score was:

|                  |                            |
|------------------|----------------------------|
| Greenwood.....   | 11 11 11 10 11 11 11 11 13 |
| Wistenmeyer..... | 11 10 1 0 1 1 11 11 11 17  |

Christmas team shoot; 12 balls, 18 yards; Bogardus' trap and rules. Score as follows:

|              |                         |
|--------------|-------------------------|
| Karsner..... | 11 11 11 11 11 11 11 12 |
| Edgard.....  | 1 0 0 0 0 0 0 1 10 2-14 |
| Emory.....   | 1 1 1 1 1 1 1 1 1 10    |
| Thomas.....  | 1 0 0 0 0 1 0 1 1 10-15 |

In sweepstakes, five single birds at 21 yards, Emory and Karsner tied on five; shoot off won by latter on three. Thomas and Edgard tied on four and divided second money. Match at 25 yards; Emory and Karsner tied at 31 yards; Emory won by three.

WACO GUN CLUB.—The Waco Gun Club shot, Jan. 1, for three elegant silver prizes; 15 glass balls; Bogardus' rules:

|                  |                           |

On tie for third, Disney won on five straight birds.

To COLOR MEERSCHAUMS.—He was a grave man. We respected him highly, because we never yet had seen any human being with such a talent for coloring meerschaum pipes. He never talked much, he mostly smoked. He recalled to our mind the party who, when he died, had no one to utter a good word for him, save one sympathetic creature who said over his mortal remains, "Well, he was a good smoker." Ho, our own smoker, was not a communicative person; but, once being out of tobacco, we gave him some Vanity Fair, and won his heart. "I will tell you," said he, between his puffs, "how it is done." He exhibited his pipe. It was mahogany, rich umbré, the delicate tints of Sienna, Vandyke Brown, with a creamy whiteness above that line of demarkation which only the true meerschaum smoking amateur understands. "Imprimis, buy a Kaldenberg pipe," he said. "I have bought pipes in London, Paris, Dresden, Berlin, Munich, Venice, St. Petersburg, but the best I ever purchased were made by Kaldenberg. It is the material, the choice material which Kaldenberg selects, which does it. It is only a silicate of magnesia, you know, and the froth of the sea is fudge. Smoke slowly, and above all be careful. Don't lay your pipe around. A scratched pipe is a horrible thing. It is dreadful to think how dumb people are. Do you remember when folks used to swathe pipes in buckskin, as if they were mummies? It was all stuff. Now, as to the theory of coloring, your maker blows his pipe in wax; and why? It isn't to increase the capillary action. That's nonsense, too. It is done because the surface of the meerschaum can be polished. The wax is there, and can be burnished, making the pipe glossy. I have had pipes of meerschaum undressed, without wax. They were neither good tasted, nor were they ever colored. Now, suppose we take a piece of stone and break it, can you see any prettiness of color or shade there? Now, take and polish it, and out comes the color. It is the glazed and even surface which, reflecting the light, intensifies the color. Don't you see? Scratch a fairly colored pipe, and the scratch shows almost white. Of course the oil of the tobacco does come through, which imparts the shade which polishing deepens. Understand? What are you to do? Why, get a piece of canton-flannel, after you have smoked your pipe, then rub your pipe bowl clean. Don't be slovenly, and leave ashes in your pipe case. Tobacco ash, containing silica, cuts the pipe like sandpaper. That's all. First Kaldenberg, and then a polish. Some more tobacco." Then the grave man lapsed into quietude. After an hour's silence he said, "I never broke a pipe in my life." We must confess that we did not credit this assertion. "It was always other people who did it," he said, reflectively. We hasten, then, to give this explanation of how to color a pipe for those who intend putting their minds to the task. Mr. Kaldenberg says our informant was right both in theory and practice.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 109) FULTON STREET, NEW YORK.

(POST OFFICE BOX 2832.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 17, 1878.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

**VICTOR EMANUEL.**—On reading of the death of the King of Italy all true sportsmen will express their regrets. For a king, Victor Emanuel was a bluff, honest and hearty man, and had endeared himself in the hearts of all Italians. Passionately devoted to hunting, he sought in the chase that wholesome relaxation from the cares of statesmanship. The title of *Re gallantuomo* will long be remembered when associated with Victor Emanuel, who, in more respects than one, resembled the best beloved of all the French Kings—Henri Quatre. May St. Hubert, the patron saint of hunters, find a place for this brave king in the region of the blest!

**OUR CHESS DEPARTMENT.**—With this week's issue we add to our columns a Chess Department, which, we trust, will be an additional attraction to our pages and of interest to a large number of our readers. Chess playing has ever been regarded as a high intellectual recreation, and the beauties of its varied and marvelous combinations engaged more than the passing attention of statesmen, generals, philosophers, poets and cultured minds for centuries past. The patient researches and investigations of different chess authors would form quite a library of themselves, and not a little astonish the uninitiated should he attempt to obtain such a collection, or be lead by a sudden inclination to inquire into the character of their contents. In the dark ages chess was only known to the nobility, and regarded with superstition and awe by the commoner; but happily the game has now extended to all classes and justly become a favorite pastime; and although of Oriental origin, it has now no confines, and is today, perhaps, more popular in America than elsewhere. The names of its eminent and illustrious masters will remain ever green so long as this world exists. Our readers, therefore, should find an occasional spare moment to devote to chess, justly called the "royal game," as did Napoleon, Frederick the Great, Franklin, and countless men of genius in the past.

**PORT ROYAL AS A PORT OF ENTRY.**—Efforts are now being made to have a port of entry established at Port Royal, S. C. This harbor, which is the most capacious on the South Atlantic coast, will, without doubt, ultimately be the terminus of the great railroad lines now contemplated, and thus form the outlet for the products of the West and Southwest.

There are a very large number of letters at this office for the gentleman who advertised in our columns for a grazing range in Colorado or Texas. We have notified him three times by mail without result.

**THE OLD GUARD BALL.**—The arrangements for the Old Guard ball, to be held Jan. 24, at the Academy of Music, are being rapidly completed, and if we may judge from the ready sale of tickets and boxes the event will be most successful. Within the last few days boxes have been secured for the officers of the Ninth and Twenty-second Regiments, the staff of the Governors of New York and Massachusetts, and for Gen. Varian and his staff; Mayor Stokley, of Philadelphia, a number of army and navy officers, and many of the foreign Consuls at New York have accepted invitations. Messrs. Taylor & Gelston, of the St. Denis, will furnish the ball supper in Nilsson Hall. The music will be by Downing's military and Bernstein's string bands.

**OUR CONGRATULATIONS.**—We offer our best wishes to our brilliant French contemporary, *La Chasse Illustrée*, on the completion of its tenth year. Under the capital management of M. de la Blanchère and his talented assistants this journal, for solid information and brilliant writing, has no equal. With correspondence from all parts of the world, the information which it often affords us we are only too glad to acknowledge. Apart from the excellence of the text, *La Chasse Illustrée* is perfect as to illustrations and general typography. We are quite certain that its future success will surpass even the expectations of its proprietors.

### VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 11.

BY THE EDITOR.

JANUARY 12, 1878.

**MY READERS:** My last letter touched of sport among the sharp-tails near Brainerd. Something of what follows will refer to my hunt among the pinnated grouse in the southern part of the State, of which my *compagnon du voyage*, John Swainson, Esq., editor of the *Swedish Pioneer*, of St. Paul, has already written at length.

While at Brainerd I was encouraged to go West into Dacotah by our mutual friend, Jerome Marble, Esq., of Worcester, Mass., whose special car had stood on a side track over Sunday. He had his family along, with two English officers as guests, Capts. Fitz Matthew and Messiter. Engagements, however, prevented my accepting his courtesy, and so I lost the opportunity to contribute my quota to his big bag of 180 birds. Retracing my steps eastward along the line of the Northern Pacific Railroad, I reached the junction at Thompson, and then ran due south along the line of the Lake Superior and Mississippi Road to St. Paul, the officers having courteously sent me passes. The first part of the route is wild, but the lower portion is much occupied by settlements; and there are some noted watering-places, chief among which is Lake Minnetonka. The greater part of the route is nearly parallel with the St. Croix River, which is the boundary between Wisconsin and Minnesota, and at Rush City it touches it. There are many places where excellent entertainment is provided, and the sportsman can get all the big and small game he wants by making one of these places his headquarters. No trouble about obtaining guides, white or red.

Of the scenery around St. Paul, as observed from the river, the guide books have spoken with abundant enthusiasm. The city is chiefly perched upon a limestone cliff, into whose base huge vaults have been excavated for the accommodation of beer, whose quality is said even to exceed that of Milwaukee. These cliffs impinge upon the river, and being interrupted by seams of sandstone, water has percolated through the latter in many places and worn out caves of great or less extent, which for years afforded hiding-places and council-chambers for the Indian tribes. The broad sweep of the Mississippi incloses an island, most conveniently located for a pier of the bridge which crosses the river. Several miles above St. Paul is the suspension bridge which unites St. Anthony to Minneapolis. This group of three cities, with their varied industries, especially the great lumber and grain interests, constitutes a commercial centre of no small significance and stir. It is difficult to imagine a financial depression that can vitally affect the great combination. The fur trade is an important item of itself, and as long as a great scattered population exists in the country beyond, it will look to St. Paul as its source of supply. It is said that those who once take up their residence in the city never move.

Twenty years ago St. Paul remained, as it had long been, the outpost of our Northwestern frontier. There was no civilization beyond, except the depots of the fur companies. The brave pioneer merchants who bartered with the half breeds in summer, when the Red River wagon trains came down from Pembina, found leisure, autumn and winter, for manly sport. Trained in the school of frontier experiences, and familiarized with all the soft and harsher features of the border, the lads who are now the middle-aged men of the city became adepts in the field. They carried the gun for pastime and the rifle for personal protection. Gentlemen who sauntered forth on the prairies and bottoms in those days after grouse and snipe were apt to meet swarthy interlopers. Frequent intercourse made them familiar with their tricks and their manners. Unpleasant little episodes taught them to scrutinize distant objects, and to scan closely and study those natural or abnormal phenomena termed "signs." They learned to divine by

the flight of birds and to interpret footprints in the grass. Every turned blade or broken twig had a meaning, and the distant smoke on the horizon was a manifestation. Game was abundant all around, and the hearts of the hunters warmed to the chase. Powder was never burned in vain. No wonder that the sportsmen of St. Paul to-day are among the best in the land. Almost all of the old lads are alive yet, with constitutions like iron, hardened by tough training, and a longevity that winks at tables of life insurance companies. No wonder they made good soldiers in the war, habituated as they were to expedients and emergencies, pot luck and hard knocks. On the grand old meadows around Fort Snelling, and within hail of the sentry, that old frontiersman, Gen. H. H. Sibley, whom the quondam readers of the *Spirit of the Times* will recognize as "Hal-a-Dacotah," has shot woodcock by the bagfull. There are Norman Kittson and H. M. Rice, his contemporaries, and Col. Uline, of the Minnesota Cavalry; A. H. Hamilton, now Treasurer of the Sioux City Railroad; Horace Thompson, President of the First National Bank; Reuben Warner; and Wm. Golcher, who made guns for them all; and a score of gentlemen a few years younger, who could tell us of the ponderous strings of snipe and ducks they once brought in from the sloughs on the river bottoms, the ruffed grouse from the ridges, and the deer from the adjacent timber and open prairie. They would smoke up a twenty-five pound canister of "Vanity Fair" tobacco before their yarn was fully spun. It is somewhat different now in these days, when the locomotives of half a dozen railway lines rumble out continually, and all the country round about is daily walked over and beaten up by the resident gunners of a city which has become metropolitan; yet there is game to be found near by, and the knowing ones will guarantee you a bag of birds at the proper season within a few miles of town. For a day's shooting this is well enough; but sometimes a man feels like several days, and then he is seldom at a loss what place to choose, as the several railway lines afford him quick transportation to choice localities.

Some of the more wealthy and devoted sportsmen of St. Paul keep a complete wagon outfit constantly on hand, sending it in a box car hither and yon at will. E. R. Warner, Esq., Superintendent of the American Express Company, has ingeniously transformed an express wagon into a hunting cart, with sections for ice, provisions, and equipments; racks for guns, lockers for ammunition, and a canvas-covered kennel large enough for half a dozen dogs. A canvas awning provides shade, and side curtains can be buttoned on for protection against rain. The seats are fitted with easy springs, and the sides are so low that it is easy to mount and dismount, which is a great advantage on a hunt for grouse.

Placing this wagon and team upon one of the trains of the Sioux City Railroad, we followed the beautiful valley of the Minnesota River for several hours, and then crossing a belt of heavy timber which bisects the State, ran out on an open prairie and halted at a town called Madelia, where we were well accommodated. Large farms and pretty towns of varying population had lain all along the route, and the numerous grain elevators at the way stations told of the natural productiveness of the land. Until we emerge from the timber we have seen little that strikes the stranger as novel; but on the prairie an observant person will notice that the pretty groves which surround the farm houses and cottages, and the trees that line the streets of the villages, have all been planted out. Very little native shrubbery is seen except at long intervals, or upon the banks of the creeks. Not far from Madelia is a pretty stream called Wahtonadon, and a little further east is a private demesne known as Crystal Lake, which is one of the prettiest residences imaginable, embellished throughout with discriminating taste. These beautiful lakes of pure water are characteristic of Minnesota, and are so frequent that they constitute one-thirty-sixth part of the entire area of the State. Given a lake and a rolling prairie one can lay out and perfect a charming home in the few years which are required for his transplanted trees to grow. Sometimes a ledge of rock crops out, and this gives additional advantages for landscape gardening. Not far east from Crystal Lake there is a beautiful fall of water over a rocky ledge some sixty feet high, with picnic grounds in the neighborhood. With these little reminders I prod my Eastern readers to remember that the prairies I write of are no longer desert and unoccupied wastes. Farms extend clear across the State on the lines of railroad, and homesteaders have taken up sections at considerable distances from these lines. To the traveller by rail little remains to indicate crudeness or primitive condition. There are comparatively few fences on the prairie, wood being scarce; but hedges are substituted with great advantage to the landscape.

Wandering apart from the railroad, the grouse hunter seeks the vicinity of the most distant grain fields where the birds are least liable to be molested. The grain having been cut, and no fences to intercept, he drives his wagon pretty much at will from native grass to stubble, conscientiously avoiding standing corn and acres of newly-plowed ground, doing no damage whatever, and seldom meeting objection from the farmers. The farms are not always contiguous to each other by any means, and houses are frequently miles apart. The prairie here is more undulating than in the northern part of the State, and the sweep of outlines more diversified. One roves listlessly from mound to dell, now dropping into an interval which wholly shuts out the view, and anon mounting a knoll from whose summit billows of grass, like swells of ocean, surge off to the horizon in all conceivable curves, peacefully islanded here and there with drooping elms and clumps of black-jack

or traversed by lines of stately cottonwoods and willows which mark the courses of the creeks. In the bottoms the grass is rank, sweeping to the armpits; but the prairie grass is for the most part short and thickly mixed with weeds and flaring flowers which emit a pungent aroma. Mouse-colored gophers heap up their mounds of earth over every square rod, while sand rats and crawfish burrow in the intervening spaces. These gophers go for the farmers' corn with insatiable rapacity. They have natural pockets on each of their chaps, which they cram with the grain until they can't see. Then they carry the grain to their burrows and go for more—and seldom go far—do these gophers. In such large proportion do they contribute to the sustenance of the hawks which constantly hover about, that it is doubtful whether it be expedient to destroy the hawks for the sake of saving the grouse. As the wagon jounces along, meadow larks, flickers, sparrows, and ring-doves fly up from the cover, and presently settle down again. Meanwhile the hawks, of several varieties, which have been idling overhead, take advantage of the momentary disturbance to make successful swoops. Occasionally we let off a cartridge at one of them. Old dogs do not like to retrieve wounded hawks. The *celat* which usually attaches to such an achievement is embarrassing to their native modesty. Sportsmen regard hawks as belonging to that class of trifles which should be handled with gloves.

We often read of the hazy atmosphere of the prairies, but the word *haze* has no application. On the contrary, the air is so transparent that distant objects seem close by; while in heated midsummer the lower stratum is often disturbed by refractions and wavelets of light, such as one detects on the outside of a stove, which have the opposite effect of making near objects appear distant, though not shadowy or indistinct. Looking off on the horizon, where the green meets the blue, we observe a belt of timber apparently miles away. Its lines are toned and softened into the semblance of clouds, yet as tangible and intensely vivid as the shapes which the sunlight throws through the stained-glass windows of a church, or the prismatic hues of the rainbow. Gazing intently at it, we discover a tawny animal of immense proportions, half the height of the trees, coursing along the edge of the timber. Almost before we have time to conjecture or become astonished, we have arrived at the spot and find that the creature was only a small coyote, or prairie wolf, and the gigantic timber merely a strip of gnarled and stunted black-jack. Again, surmounting a knoll, we overlook a valley of apparently great extent, sweeping gracefully to a parallel eminence opposite, and filled with such shadowy repose and softened hues that Tom Moore's Vale of Cashmere seems no longer an oriental dream. On the farther elevation are objects whose outlines seem sharply defined, but the filling of the picture is so blurred and blended that we cannot determine whether it represents a large barn or a haystack of enormous size. A few minutes' walk, however, will bring us to a small bush or pile of weeds! In the far distance is apparently a sandstone cliff, flanked by grassy bluffs of richest green. When we reach it, we find only a patch of coffee-colored marl cropping out of a rise in the prairie. In like fashion the golden stacks of grain on the tops of knolls gleam in the sun like sulphur-capped cones of volcanoes. And so, throughout all the landscape, one continually meets the like phenomena. A few rosin weeds or mullein stalks a furlong off may take the semblance of a clump of trees, or a horse and buggy be transformed into an army wagon or load of hay. When the waves of refracted light are multiplied the true mirage results, and then every object becomes distorted out of all true character. One of the most comical effects is produced by a flock of cranes dancing. It is "too funny for anything." Stage shadows are nowhere. First, their legs get so mixed up and interlaced that each pair seems to belong to the whole flock. Presently the legs begin to thrust, cut and parry, like a hand-to-hand combat with swords; heads and bodies swell into balloons; out steps one leg and kicks them all into collapse; the shapeless mass resolves itself into a trio of donkeys with huge, flapping wings, and these wings presently change to panniers; one of the donkeys kicks up behind, turns a somersault and swallows himself; the rest follow suit, and all blend into an elephant with twenty pairs of legs; then cranes' necks begin to stretch up out of the body, and keep on stretching until they get so thin that they break off; legs turn to a file of soldiers, front dress, eyes right; all simultaneously bring their hands to their hips and lift themselves into the air by the waistbands; elbows grow into huge wings, and as they fly off they change back into the cranes which have taken flight at our approach.

Cranes are wary birds and difficult to approach, and since they make a most palatable dish sportsmen are proud to count them among their trophies. Their flesh is white, and especially toothsome when boiled or made into a pot-pie. Various are the subterfuges and stratagems employed to circumvent them. The best method is to drive as near as possible without seeming to observe them—not directly, but with a detour—and, when the wagon is prudently near, let one or two of the gunners quietly drop off behind, while the wagon passes along out of distance. By carefully crawling through the grass, the gunners can sometimes approach within fair gunshot.

It was as hot as Tophet when we beat up the prairies around Medalia. The sky was cloudless; the thermometer marking 97 deg. in the shade, and the wind blowing a red-hot gale from the southwest. It was more tolerable in the shade under a lee than in the full sweep of the wind. The birds, however, were more numerous than we had found them before, and we scored twenty-four brace for our united bag. Nearly

all were driving birds, scooting down wind like rockets, and affording the most sport I have ever known pinnated grouse to do. Pinnated grouse lie closer to a dog, and are not as swift flyers as the sharp-tails or white-breasted grouse. The range of the latter is from the northern boundary of Kansas to Alaska; of the former, from southern Minnesota to Texas. The first are found in the scrub chiefly, the second in grass. Both species are not often bagged on the same range. To get our birds we scattered wide, each marking down flocks or stragglers as they flew far and near, and seldom missing a count. It was terrible work for the dogs, who would have suffered more but for a crystal runlet that wound through a part of the territory where we hunted. For the most part, however, they had to depend on the wagon butt, and the delicious and refreshing ice, whose supply did not give out. In very hot weather sportsmen should apply small pieces of ice to the tops of their dogs' heads. At such times pointers are always thankful that they were not born setters; they don't take much stock in "fine feathers."

One of the most interesting phenomena of the prairie is the "tumble-weed." In the growing summer time it is a goodly bush, with branches numerous, thick, succulent, and spreading; but in the autumn, when the sun has ripened the grasses as well as the grain, when the earth is parched and dusty, and seeds rattle in the pod, it becomes the driest and scraggiest of weeds. Not a particle of moisture remains in its fibres. Its once pinnate-like root shrinks to a mere sinew, and the passing winds of September scurrying over the plain catch it by its withered fronds and whisk it around and round until the root wears itself loose in its hole, and the thread-like extremity clinging to the moister ground below, alone holds it in its place as the anchor holds a storm-tossed ship. As gale after gale passes, feeble becomes its fastening, until finally it breaks loose altogether and goes tumbling over the prairie, grasping the golden rods and mullein-stalks with its claw-like fingers, or temporarily clinging to other weeds more firmly rooted. But its career is as fated as the waif on the rapids of Niagara. Another whiff of wind tears it loose again, and away it goes, streaking it like mad, and rolling itself into a ball, gathering other weeds as it rolls and growing rapidly and enormously by constant accretions, until at length it has reached ten feet in diameter! Its specific gravity is lighter than cork's, but it is tremendous for size; and as it comes bowling and bounding over the grass at locomotive speed, borne toward us on a 2:40 blast, frightful in its threatening aspect, tell me what unaccustomed horse can be found so staunch as to keep his tracks in the ghostly demonstration? One might imagine the boulders of the glacial system let loose on a frolic, or Titans and Son, of Anak rolling ten-pins down the shores of Time! To see a vast area of prairie in this commotion, with tumble weeds rolling far and near, one feels as if prophecy were being fulfilled, and "the heavens and earth were rolled up like a scroll." Had the tumble-weeds been a little riper and the gale a trifle stronger, we would have had to do our hunting under disadvantages such as I have portrayed.

I do not care to occupy space with a repetition of the oft-told story of a grouse hunt. Those who have been there know how it is themselves. Those who don't know but wish to, can learn the lesson in the papers and books, I will only say that I found two articles of rig most convenient. One was a "70 shooting coat," made by George C. Henning, of Washington, D. C., in which I comfortably carried my seventy-six shells; (no other contrivance so satisfactory;) the other a set of leather thongs fastened to a waist-belt, which, fashioned into loops, carried dead birds conveniently by the heads until they could be deposited in the wagon. I have used this method for years. It is better than pockets or game bags, which cumber and chafe.

We spent but one day on this lay, as the next morning threatened rain, which finally came in torrents in the afternoon. However, we improved the washing hours by shooting ruffed grouse on the Minnesota bottom, near a station where the early train dropped us, the birds being fairly numerous and affording good sport. In the evening we retraced the remainder of our journey back to St. Paul.

My next letter will conclude this series. I make the announcement because I fear my readers will think that, like Tennyson's Brook, I shall babble on forever. HALLOCK.

#### OUR WASHINGTON LETTER.

DUCK SHOOTING ON THE POTOMAC—SINK BOXES AND BLINDS—WILD WATER-FOWL AND THEIR FOOD—COVES AND CREEKS—BIG GUNS AND FRIGHTENED BIRDS, ETC., ETC.

[FROM OUR OWN CORRESPONDENT.]

WASHINGTON, D. C., Jan. 5, 1878.

The Potomac River from this city to its mouth, a distance of about one hundred and ten miles, with the numerous creeks and inlets on both the Maryland and Virginia shores, has always been a favorite resort for water-fowl during their spring and autumn migrations, but more especially at the latter season, when they seem to be attracted to these waters by the abundance of food found on the flats and shoals where they stop for rest and to satisfy the cravings of hunger caused by their protracted flights through more northern regions. For some years past the numbers of these fowl have steadily decreased from several causes, one of which is the constant warfare against them, not on the part of the few who indulge in aquatic shooting for pleasure, but the hundreds who shoot them for profit, and supply the markets of Washington and

neighboring cities. The big guns used by such persons, with half a pound of powder and several pounds of shot for a single load, not only carry death and destruction among the ducks, but frighten off all within miles of them. The new game law of Virginia makes it unlawful to kill any water-fowl except with a gun that can be raised at arm's length and fired from the shoulder without a rest. It is to be hoped that the law will be rigidly enforced. Another cause of the decrease in the number of our water-fowl is the gradual destruction of their food, and especially the *Valsneria americana*, or wild celery, upon which the far-famed canvas-backs, red heads, bald pates and some other varieties subsist while in this section of the country. A few years ago a favorite feeding ground for these ducks on the James River, where the wild celery was abundant, was entirely destroyed by a season of cold weather when the ice formed to an unprecedented thickness for that climate, and the stalks of the plant, which grow from six to eighteen inches in length, were thus enclosed in the ice. A sudden change in the temperature and warm rain caused a rapid break up of the ice blockade, and the celery being easily uprooted was torn from its bed by the ice and washed out of the river by the freshet. The next seasons there was hardly a stalk of this marine plant to be found where it was so abundant for years previous, and consequently the ducks deserted that section.

I have on many occasions been deeply interested in the reminiscences of old sportsmen, who can no longer stand the hardships of aquatic shooting, but who, twenty, thirty and even forty years ago, enjoyed that sport on the Potomac when the birds were so plentiful that they covered the surface of the water for miles; but they have steadily decreased in numbers year after year, until this season we have scarcely any ducks on the river, and those who have made a business of shooting them for market have not been well rewarded. I am inclined to the belief that the exceedingly mild winter we have had up to this time have retarded the birds in their southern flight, and that they will be more plentiful after we shall have had a brief season of cold weather. As the temperature has not yet been below the freezing point, the ponds and creeks all over the country are open, and the birds have not been forced to resort to the large rivers, as they often are when smaller bodies of water where they feed are closed by the ice. As to the delicious canvas-backs, very few have made their appearance, but some mallard, green and blue-winged teal and other species have been killed.

#### FAVORITE SHOOTING POINTS.

The Potomac, one of the most beautiful rivers of the North American continent, off the city, is about one mile in width, but it gradually expands until we reach its mouth, where it is twelve miles wide. From here to Aquia Creek the water is fresh; about that point it begins to get brackish, and a few miles further we come to Blackiston's Island, where it is quite salt. I might fill a column and weary the thousands of readers of FOREST AND STREAM should I attempt to name the many famous shooting points on the river. There are any number of persons who are fond of the sport of duck shooting, although the exposure from cold and wet is often very disagreeable, and unless the sportsman be robust and healthy he had better keep out of the blinds. To those blessed with a strong constitution, and who are able to stand severe weather, the sport excels that of field shooting. On the Virginia side of the Potomac the nearest feeding ground of the ducks is in an extensive cove just beyond Gravelly Point, and near the Four-Mile Run, half way between this city and Alexandria. A short distance below Alexandria is Hunting Creek, another favorite resort. Soon we reach Mount Vernon, with its extensive flats covered with grass. Doag Creek, Gunser Cove and Craney Island are the next places, and this brings us to Occoquan Bay, where the *Valsneria* is plentiful, and canvas-backs are generally quite abundant in that locality. Freestone, Cockpit and Brents Points are favorable refectories for shooting the ducks as they pass from one cove to another. Aquia Creek, Marlborough Point, Upper Machodoc Creek, Rosiers Creek, Bluff Point, Faime's Point, Mattox Creek, Curwinan Bay, Nomini Bay, Hollis Marshes, Elbow Point, Lower Machodoc River, Ragged Point, Jackson Creek, Yeocomico River, and the numerous inlets and coves in that vicinity, Travis Point, Coan River, with its creeks a shoals, Presley's, Hall's and Cubitt's creeks, and finally the Little Wicomico River, emptying into the Potomac a few miles this side of the Chesapeake Bay, are all well known as desirable feeding grounds for the water fowl frequenting this sect.

On the Maryland side of the Potomac, commencing at Oxen Creek, between this city and Alexandria, and then in Broad Creek just below that city, ducks are always found in season. Following down this side of the river we reach Hutton's Point, Piscataway Creek, Chapman's Point, Pamunky Creek, Mattawoman Creek, Chicomuxen Creek, Wade's Bay, Smith's Point, Lower Thomas Point, Nanjemoy Creek, Blossom and Windmill Points, Port Tobacco River, Pope's Creek, Lower Cedar Point, Picowaxton Creek, Swan Point, Neal's Creek, the Wicomico River, St. Catharine's Sound, Bullock's, St. Catherine's, St. Margaret's and Blackiston's Islands; and then St. Clement's Bay, Kaywood's and Higgin's Points, St. George's Creek just below Piney Point, the St. Mary's River with its numerous creeks and inlets, Calvert Bay, and finally Point Lookout at the mouth of the river. Along the whole course of the river, in the creeks and shoal waters upon either side, the ducks, geese and swan find the various marine plants and grasses, water insects, crustacea, etc., upon which they feed and grow fat.

## DUCKS AND THEIR FOOD.

Generally the ducks begin to arrive in this locality from their breeding grounds in the North, between the middle and latter part of October, when some of the smaller species, such as the buff-head (*Bucephala albeola*), make their appearance, and they are in the course of four or five weeks followed by the mallard (*Anas boschas*), dusky duck (*Anas obscura*), pin-tails (*Pinetta acuta*), bald-pates (*Mareca americana*), green-winged teal (*Querquedula carolinensis*), blue-winged teal (*Querquedula discors*), red-head (*Fuligula ferina*), and, lastly, the noted canvas-back (*Fuligula valisneria*); but this duck never becomes abundant until severe weather is experienced. The swan (*Cygnus americanus*) and geese (*Branta canadensis*) also arrive about the same time as the canvas-backs, and soon distribute themselves over the Chesapeake Bay and neighboring rivers emptying therein. When the birds first arrive they are very poor, and their flesh has no desirable flavor on account of their protracted flights. A few weeks' rest in this section, however, and the abundance of food which they procure, soon puts them in excellent condition, and they become tender and juicy.

The *Valisneria*, or duck grass as it is called here, seems to be the favorite food not only of the canvas-backs, but red heads, bald pates, and some other species. I have often observed them feeding together where this plant grew, though I have never seen them in company during their flights. Old sportsmen here, with whom I have conversed on this subject, declare that the red-heads and bald-pates especially are the most daring robbers in the duck family, and frequently attack the canvas-back when he has returned from the bottom with the duck-grass which he has uprooted, and plunder him of all his spoil. Others express the opinion that the canvas-backs uproot the grass and consume the root thereof, which is the most tender part, and that the other species usually found feeding with them eat the stalks and leaves. That the canvas-backs and red-heads especially partake of similar food is evident from the flavor of these two species, which is so much alike in every respect. Indeed, there are many persons claiming to be sportsmen who are not able to distinguish a canvas-back from a red-head after the feathers have been removed or the two served upon the table. True, the canvas-back is the larger duck of the two, as a male bird of this species will weigh very often as much as three and a half pounds, or even more, while a male red-head rarely exceeds two and a half pounds in weight.

## MANNER OF SHOOTING THEM.

Of course there are various means employed to kill the ducks by those who wage a warfare upon them for pecuniary gain, the principal one of which is the use of the immense ducking gun to which I have briefly alluded. This piece of ordnance, with a barrel from five to seven feet in length, and a muzzle of two inches in diameter, is affixed to one end of a skiff, and the gunner, lying down therein, paddles cautiously upon a flock, with very short paddles made for that purpose, and which work entirely beneath the water. When within 200 or 250 yards of the birds, he fires upon them, with his load of nearly half a pound of powder and three pounds of shot. The report of his gun frightens all the fowl within a mile, and the recoil from the explosion sends skiff and gunner back fifty feet; but there in front of this death-dealing concern lie many birds dead and others wounded, but the gunner, with a gun which can be discharged from the shoulder, soon pursues and captures them.

The market hunters also trap the fowl by means of nets, though they can only prosecute this mode of capture in creeks and inlets where the birds are not disturbed by the guns. These nets are staked out, covering the surface of the water to the extent of a quarter of an acre or more, and beneath them is placed a bountiful supply of corn. Rows of corn are then strewn in the surrounding water, all leading to the net, and the ducks, finding these rows of corn, keep diving for and consuming it until they get beneath the net and are caught.

Sportsmen who enjoy the duck shooting of the Potomac usually do so from blinds, though many have rare sport upon different points of land along the river, dropping the birds in their morning and evening flights from one feeding ground to another. This shooting, however, depends to a great extent upon the velocity and direction of the wind. If it blows with the same force and on the point where the sportsman may be located, providing it lies in the course of the ducks, he is apt to have good success. The birds always avoid a near approach to the shore, but when the wind blows toward these points they are often compelled to pass within easy shot, and are thus dropped while on the wing.

Shooting from blinds is practiced to a great extent along the entire length of the river, and many birds are killed by sportsmen in this manner. The blind is generally constructed of old brush, fence rails or logs, sometimes upon points of land or in marshes over which the fowl pass, and at other times on the flats at some distance from the shore, but always early in the season, so the ducks will become used to it. When placed upon the flats the blind is always made of brush, and large enough to conceal one or two sportsmen and a skiff. The decoys are anchored in the vicinity of this blind, where they attract the attention of the birds passing over from one feeding point to another, and as they descend to join the supposed flock upon the water the concealed sportsmen often have beautiful shots. Sometimes the birds are allowed to alight among the decoys, but the true sportsman drops them on the wing just as they hover over the decoys, fifteen or twenty yards above the surface of the water.

The shooting or sink box is not regarded as legiti-

mate by the true sportsman. It is used by the market hunters, and consists of a long, narrow, coffin-like arrangement, in which the gunner lies on his back. This box has attached to it flanges or broad leaves hinged to it at the top, which float upon the surface of the water and prevent the swell from washing into it or the box sinking. The decoys are arranged around it just as around a blind, and as the birds descend to join the flock the gunner arises and gives them both barrels. These sink boxes are generally towed upon the flats, and there anchored with the gunner concealed, while his comrade is secreted upon the shore with a light skiff to pursue and capture wounded birds which may be dropped. Years ago there were a number of points on both shores of the Potomac lying in the course of the birds as they passed from one feeding ground to another, and many birds were killed on wing in a true sportsmanlike manner as they passed over these points. It is a well known fact, however, to all familiar with the habits of wild water-fowl, that the constant disturbance of them on favorite feeding-grounds will cause them to forsake such places and seek others. The interminable pursuit of them with boats upon their feeding haunts has, to a great extent, driven them from many desirable coves, and therefore the shooting points over which the birds formerly passed in their flights from one cove to another no longer afford desirable places for dropping them.

The ducking season on the Potomac usually opens about the middle of November, and about that time mallard, dusky ducks, green and blue winged teal, bald-pates, and sprig-tails are plentiful. As the weather begins to get very cold, blue-winged teal and bald-pates leave for a more southern climate, but canvas-backs make their appearance and soon become plentiful. Mallard, dusky ducks, green-winged teal, and sprig-tails remain longer, and, indeed, if the weather is not too severe, many tarry here all the winter. Even when the river is closed by ice there are hundreds of springy places in the marshes and creeks on either shore which do not freeze, and here the birds generally find food.

THE CANVAS-BACK (*Fuligula valisneria*).

Of the many varieties of ducks frequenting the Potomac, of course I rank the canvas-back first, as it acquires a most delicious flavor here from the wild celery upon which it feeds. In some other localities, where it cannot procure this food, and is forced to live upon water insects, seed, berries, etc., I believe it loses this flavor, and is held to be a very common bird. The Chesapeake Bay, Susquehanna, Potomac, James and other rivers emptying into that body of water, are the favorite resorts of the canvas-back on the Atlantic coast. They extend their winter migrations to more southern waters, and are distributed more or less abundantly throughout the interior. The fall migration of the bird, I believe, is principally from the north-west and over the interior of the country, where it is distributed according to the nature of the weather. Some ornithologists have found it breeding in our Western country as far south as latitude 47 degs.; in the Cascade Mountains of Oregon and in the Rocky Mountains. Its breeding grounds extend from that section far into Alaska and the north. It does not breed in any of our Eastern States.

Audubon, who seems to have studied the habits of the canvas-back in New Orleans, when he was there in 1837, does not speak very favorably of the delightful flavor of this bird. After referring to the species commanding a price of two dollars a pair, he says: "This enhancement of its value I look upon as having arisen from the preference given to it by the epicures of our middle districts, who have strangely lauded it as superior to any other duck in the world. Previous to that time, in the South, they were regarded as being poor, dry and very fishy, in short not half so good as mallards, or blue-winged teal. With this I cordially agree; for there, at that season, they are not better than represented."

No doubt the birds were unable to procure the *Valisneria* or wild celery, and therefore did not excel any of the other species in flavor.

The canvas-back is a rapid flyer, and it takes an expert marksman to drop him. If winged only and brought to the water he is an expert diver, and will frequently make his escape by diving and moving under the water toward the shore, where he will seek shelter and may recover from the wound, provided he can escape his natural enemies—minks, gulls, hawks, etc.

RED-HEADS (*Fuligula ferina*).

Next to the famous canvas-back comes the red-head, and though it is smaller, equals that duck in flavor, as it feeds upon the same marine plant when in this section. In the West I believe it lives on various water insects, frogs, grain, berries, and such food as it can get, and I suppose does not have its delicious flavor in that locality. Red-heads seem to be of a sociable disposition, and are often found in company with other ducks, especially the canvas-backs and bald-pates, and in Florida I am told they are often seen with mallards, spoon-bills and other species. It is fond of both fresh and salt water, and is an expert diver. It breeds in the far north, and like the canvas-back its migrations are overland rather than by the seaboard. The weight of a full grown male red-head is about a pound and a half less than that of a full grown canvas-back.

As I have yet much to say respecting the habits of the mallard, teal, pintails, bald-pates, geese and swan found on the Potomac, I will endeavor to interest your many readers in my next letter.

—A friend in Spottsylvania, Virginia, who probably thinks our head is too big for our body, has sent us an Indian arrow-head.

## GAME PROTECTION.

**NATIONAL SPORTSMEN'S ASSOCIATION.**—The annual meeting of the National Sportsmen's Association will be held at Wilkesbarre, Pa., June 11. Secretaries of State Sportsmen's Associations are requested to send their addresses to Benj. F. Dorrance, Esq., Secretary of the Pennsylvania Association, Wilkesbarre, Pa.

**THE PHILADELPHIA ASSOCIATION AT WORK.**—The grand jury have found a true bill against Philip J. Lauber, charging him with selling game out of season. The prosecution is brought by the Sportsmen's Association, and is the first of a number which are to be instituted against restaurateurs.

**PROTECTION OF GAME.**—The annual meeting of the New York Association for the protection of Game was held on the 14th of January at the residence of Mr. Charles E. Whitehead, Mr. Clinton Gilbert presiding. The following resolution in reference to the sale of venison was unanimously adopted:

That, after reading the petition of the importers and dealers in venison in this city, the club consider it unwise to attempt to extend the time within which venison can be sold in this State, and the counsel of the club is directed to prosecute all persons found after the 21st violating the law on this subject.

Mr. Whitehead read a communication in reply to charges made against certain parties trapping wild duck on Shinnecock Bay. The accused parties denied that duck trapping was practiced on the bay. The feasibility of altering the game laws in relation to the shooting of woodcock, to make it commence on Sept. 1 instead of Aug. 1, as at present was discussed. It was deemed inadvisable to make any effort to amend the law on that subject. The Treasurer showed a balance of \$578.20, and in United States bonds of \$4,600. Mr. Whitehead, counsel of the association, showed that during the year twelve suits had been brought for violation of the Game laws. The officers of the association for the ensuing year are: President—Robert V. Roosevelt; Vice-President—J. H. Gautier; Counsel—C. E. Whitehead; Secretary and Treasurer—J. M. Cuthbert; Executive Committee—Henry T. Cary, Alfred Wagstaff, Jr., W. M. Fliess; Committee on Game Laws—Mr. Alfred Wagstaff, D. L. Luddington, and R. B. Roosevelt.

**KILLING DEER FOR THEIR SKINS.**—At a meeting of the California Senate Committee on the revision of the Game law, it was stated by a member of the Sportsman's Club that two hunters had been shooting deer for two years past in the eastern counties, under engagement to a glove manufactory in San Francisco. Hundreds of deer were slaughtered and their carcasses left for the coyotes and birds of prey. This wholesale killing has nearly exterminated the deer tribe in that part of the State.

**POUND NETS IN STATEN ISLAND WATERS.**—The New York and Staten Island fishing clubs have given the impulse to the movement against the use of pound nets in New York State. Their counsel, Messrs. Morgan, J. O'Brien and J. Stillman, appeared last Friday before the Board of Supervisors, of Richmond County, asking for the pounds and a new regulation concerning the use of fykes and gill-nets. Counsel urged that, as, under section 32 of the laws of 1877, the Board of Supervisors has power, it should entirely prohibit the use of pounds in the waters surrounding Staten Island and the rivers approaching thereto; and also that the use of fyke and gill-nets be forbidden from the 15th day of August to the last day of December in each year, and that no fyke, seine or gill-net shall have meshes of less than four and one-half inches in size. The matter was referred to a special committee, with instructions to draft such regulations as will remedy the evil complained of. This is but the initial step in a general movement, and soon King's, Queen's and Suffolk counties will follow Richmond's example.

**ACCLIMATIZATION SOCIETY.**—The annual meeting of the American Acclimatization Society was held at the New York Aquarium last Wednesday evening. Fourteen new members were enrolled. The officers elected for the ensuing year were President, Eugene Schieffelin; Vice-presidents—A. H. Green, William H. De Lancy, R. B. Roosevelt, W. H. Schieffelin, F. Van Zant Lane; Secretary, John W. Green; Corresponding Secretary, Seymour A. Bunce; Treasurer, Edward Schell. Council—J. C. Mills, John Schuyler, Henry Keteltas, J. W. Fellows, H. C. Pell and W. A. Conklin.

## EDITOR FOREST AND STREAM

It is not generally known and it is still less appreciated, that the waters of central New York are most magnificent in proportion and exceedingly suitable for game fish.

Seneca River, receiving its supply from Canandaigua, Kena, Seneca, Cayuga, Skaneateles and Onondaga Lakes, besides other smaller lakes and numerous streams and brooks, finally merges with the Oneida River at what is termed Furoe River Point, and thus forming the Oswego River it finds its way to Lake Ontario.

No one can trace the course of these waters, knowing the immense supply, without concluding that they must be suitable for bass, pike, pickerel and other game fish, as they certainly are.

That these waters can be productive of countless thousands of choice fish for the public at comparatively little cost, and at the same time afford abundant recreation for hundreds of sportsmen, there is no shadow of doubt; provided, however, there be given sufficient protection to fish to multiply and attain suitable size.

Under the present deprivations that are annually committed by the use of seines and nets of every description, and especially by catching fish in spawning seasons, the supply is nearly exhausted, and to attempt a day's fishing in these waters with hook and line, is simply a waste of time, money and patience.

It is safe to say that not less than forty or fifty pound-nets, gill-nets and other illegitimate and barbarous ways of taking fish from Oneida Lake (about fifteen miles from Syracuse), have been used by marketmen and resorted to through the entire season of 1877; and even farmers owning land on the banks of this lake as well as other prominent business men residing near, have been engaged in this nefarious traffic and shared in the results: no appeal, no threats, no inducements are of any avail, and the conclusion seems to have at last been arrived at that the evil must work its own cure by eventually destroying the source of supply.

SYRACUSE, Jan. 7, 1878.

JONES.

**SIR HENRY HALFORD EXPERIMENTING.**—Sir Henry Halford writes to the *Volunteer Service Gazette* that he will shortly lay before its readers a full report of experiments he is making "between English and American rifles."

**SERGEANT FERGUSON'S SPEECH AT INVERNESS.**—From the *Inverness Advertiser* we learn that Sergeant Ferguson, of the English team, made a capital speech on the occasion of a total abstinence society meeting, of which he is a leading member. A handsome gold medal was presented to Sergeant Ferguson as a remembrance of Mr. Ferguson's services in the Highland Rifle Volunteers. The Sergeant, referring to the Creedmoor contest, commented on the excellence of the American team-shooting. The hot weather, the Sergeant said, was somewhat against the English team, and the mosquitoes, although very small insects, had caused them many sleepless nights. One thing very much to the point, which we copy in full from the gallant sergeant's speech, was as follows:

"The majority of good rifle shots in this country (America) are generally very temperate men, and during our shooting on Creedmoor I was very much pleased to see that almost all the American marksmen drank only milk, which goes so far to account for their steadiness. In fact, during our stay on Long Island, I did not see anything more than a glass of claret drunk by any of our party, or even their many distinguished guests, and very few indulged in so much."

We heartily indorse Sergeant Ferguson's ideas about abstinence in regard to rifle shooting. Drinking men never make good rifle shots.

## BREECH VS. MUZZLE-LOADER.

BRIDGEPORT, CONN., Jan. 8, 1878.

EDITOR FOREST AND STREAM:

The international rifle match of 1877 has almost passed from the minds of the American people. They are accustomed to victories that they take them as a matter of course, and in a few weeks they are comparatively forgotten. But such is not the case with the defeated nation. It has been said of them that "they never know when they are whipped." In this case it appears that they are gradually beginning to suspect that, at least, they were not victorious, and their newspaper writers are vigorously endeavoring to prove that the Americans won the match because they had worse guns, poorer powder, and men of indifferent shooting abilities. Our men are characterized as "mere trigger pullers," our rifles as "despicable abortions" and "mere shams." The *Volunteer Service Gazette* abounds with correspondence of this kind, and many of the letters have been from gentlemen who have had abundant opportunities of learning the truth. But they appear to be of that class of men who—

"—convicted against his will,  
Is of the same opinion still."

The principal charge made against our guns is that they cannot be shot without cleaning after each discharge, and the charge is sweeping. Long-range military and sporting rifles are all included. Sir Henry Halford, in a letter to the *Gazette*, writes: "Without cleaning the American breech-loader is absolutely useless, for no second cartridge can be inserted." We trust Sir Henry will not consider us discourteous if we republish part of a private letter he wrote us in 1875. We felt proud of the score at that time, and still think it a good one. In 1874 he ordered one of our long-range breech-loading rifles, and, acknowledging its receipt, he sent us the score and diagram of target made at his first trial with it. We send you the diagram as it appeared in your columns at that time:

5 4 5 5 5 5 5 5 5—49 out of a possible 50.

And now we quote from Sir Henry's letter: "Forty-nine out of a possible fifty at 500 yards; fired ten shots; very bad light; lying down, no rest; rifle not wiped out." In addition to this testimony we produce that of J. K. Miller, one of the best shots in the United Kingdom, either at long or short range. He shot a Sharps' mid-range breech-loader at the meeting in Chicago last fall, winning the first prize in a field of forty competitors, at 800 yards, off-hand, without cleaning, with a score of 48, the best ever made at that distance off-hand. Added to the testimony of these may be had that of many Englishmen who have hunted on our Western frontier. Their arms are very generally used, and the hunter seldom or never cleans his rifle till camp is made at night. Professional hunters for pelts often bag one hundred or more buffalo in a day, and do not clean from first shot to last. We make rifles that can be fired 1,000 consecutive shots without cleaning, and still retain their accuracy.

Mr. John Rigby, who makes one of the best of muzzle-loaders, and is a correspondent of the *Gazette*, refers often and with evident pride to the fact that in 1874 he defeated us in a match with his muzzle-loaders against our breech-loaders, both without wiping. We acknowledge the defeat, but deny that it was a conclusive test, or that it proved anything except perhaps that we had yet much to learn about rifle shooting. In the first place, our representatives at that time had had but little experience in shooting 1,000 yards in the strong, gusty wind in which this match was shot, it being their first year at the sport, while their antagonists were veterans of ten years' practice. Again, in point of fact, the muzzle-loaders, though not "wiped," were cleaned every shot, for it is impossible to "insert a second" bullet until the barrel has been cleaned by forcing down upon the powder a thick and tight-fitting and lubricating wad, which carries all the debris with it, leaving nothing to impede the true flight of the bullet. Last we be accused of being inconsistent, we hasten to say that we do not claim for our match rifles, with their heavy charges of powder and lead, that they will do as close work without cleaning as with. Our military and sporting rifle cartridges contain sufficient lubricating material to keep the barrels in good shooting trim; this is left out of the long-range ammunition. As the purpose for which the match rifles are made admits of cleaning, they are made with that intention. As we have shown, the muzzle-loader is cleaned (or supposed to be) every time it is loaded, and this difference between certainty and supposition is just the difference between a breech and muzzle-loader, and manifestly in favor of the former.

We claim for our breech-loading military rifles that a fair shot can

keep on the target (6x12) at 1,000 yards without cleaning; and a rifle that can be shot within the space occupied by a front of six men, at that distance, is accurate enough for military purposes. As regards the alleged high prices of American arms, we will not ask you to publish all of our price list for the benefit of our British cousins (you might mention that it will be mailed post free upon application), but our best match rifles are only £20 instead of £40. The latter figure can be made up in extra polish if desired, and our military rifle is only £25, while the sporting rifles vary all the way between these two extremes. We leave our marksmen to defend themselves against the imputation upon their skill. They have shown themselves capable of doing it in the past in four international matches. But if it be true that our men are "mere trigger pullers," that "every rifle is fired by the captain," we are surprised that none of the writers have taken note of the extreme politeness of our captain in the late match in firing all the other rifles so much better than his own.

Yours truly,

SHARPS' RIFLE COMPANY.

For Forest and Stream and Rod and Gun.

## EXPLOSIVE AND EXPANSIVE BULLETS.

Explosive bullets have only lately excited the attention of American sportsmen, and very naturally great results are expected from them. Having given such bullets a thorough trial on deer as well as smaller animals, my experience may be of some value to those about to adopt them, and also to afford an answer to the many inquiries about them by correspondents of the *FOREST AND STREAM*.

Their construction is very simple, and any gunsmith of any skill can easily make the moulds. A moveable metal plug is inserted at each casting, so as to leave a cylindrical hole in the front end of the ball, running back one-half or two-thirds of its length. This plug is guided and held in place by passing through a thick, solid plate of metal, screwed to one side of the moulds. Upon striking any solid substance, even though it be very soft, the walls of this cylindrical hole expand outward. To insure accuracy the hole must be closed and the end smoothed over. This may be done with wax, or in cold weather with tallow. Copper cylinders made for this purpose are very good. When carefully made, these balls have a perfectly accurate flight up to 400 or 500 yards.

This is the expansive or "express" bullet, though "express bullet" properly means an expansive ball that is also very light in proportion to its calibre, so as to have a high initial velocity—the most sensible idea in the world for a hunting rifle.

This may now be made explosive in several ways, of which by far the best is to have the plug made the size of a rim-fire pistol cartridge, .22 long for a .44 ball. Then take the ball out of the pistol cartridge, fill it up with powder, and insert it in the rifle ball until the rim sits close upon the edge of the hole. These will explode without fail upon the softest flesh, and may be carried (except in the Winchester rifle) and fired with perfect safety. If any hammering be necessary to seat the ball in the cartridge, the pistol cartridge must, of course, not be put in until the other is loaded.

This ball makes, upon striking, no larger hole than that the solid ball of same size. At about an inch deep it explodes and makes a wedge-shaped hole, the width increasing with its depth for three or four inches, and varying with the toughness of the animal from two to four inches at the widest part. This wedge-shaped hole is caused, not by the explosion, but by the outward expansion of the walls of the cylinder. If the animal be a small one, such as a fox, the hole on the opposite side will be from three to four inches across, according to its age and the place of striking—a young one being almost cut in two by it. But on a large animal, like a deer, the sides of the cylinder generally tear off, and the butt of the ball passes on as an independent bullet.

So much for the ball; now for the results. The ball I have used is one that, when solid, would weigh about 530 grains. .44 calibre, with a .22 long rim-fire pistol cartridge inserted, and driven by 70 grs. of the best powder. Having a very fine shooting .44 Maynard, I hoped that these balls would fully overcome the great trouble which makes deer hunting in or near the thick chapparal of California with a small-bored rifle not only a vexation, but, I don't hesitate to say, an outrage. I fully believe that at least one-third of the deer shot in California die a lingering death in the chapparal, either from their wounds or from blow-flies, which generally kill anything that is wounded, unless it is attended to by man. Here a wounded deer strikes instantly for thick brush and there skulks and hides so that he cannot be seen any distance, and cannot be approached because of the noise.

I very naturally thought I had struck just the thing, for on trying this ball upon two hares, they were blown into a fair grade of boarding-house hash, and a mud hen was lifted about five feet in the air, and had its back, one leg and one wing broken by the shock from a ball fired purposely three inches under it into the water. I was still more pleased on trying them on deer. The first shot I got was on a three-year-old buck, that dropped almost in his tracks from a ball behind the shoulder, when with the solid ball he would probably have run fifty or one hundred yards. On opening him I found the lungs torn into shreds.

The next was one of those provoking shots called a "panch shot," which are often unavoidable where you have to take many running shots. The deer died in about 400 yards from the place, where struck. With the solid ball it could have run all day, and I naturally thought this solved the vexatious question of "panch shots."

The next shot was at a doe, in a position where I had to take a "hunch shot" or none. I heard the ball explode, saw her drop her leg and start on a hobbling gait for the brush, and had that exquisite pleasure so often enjoyed by the possessor of one of those single-barreled small calibre abominations, misnamed "sporting rifles," of seeing my deer disappear to die beyond reach just as I got a second cartridge in. The trouble with this shot will be explained further on.

To go through the list would weary the reader. Suffice it to say that of forty-two deer unmistakably struck, eleven have escaped entirely; while out of the thirty-one I have bagged, seven were saved only by getting in another shot, either by heading off or where the brush happened to be thin enough to allow tracking without making a noise, by allowing them time to lie down and sicken. Twenty-four (a large proportion) either dropped in their

tracks or within a very few yards. Every one struck in or back of shoulders, or in the neck or loins, dropped in less than half a minute, while every one struck in the paunch, stern or hip either got away, or was secured by a second shot, obtained only by hard or careful work. Of eight struck in the paunch not one showed any more sign of distress than they do when struck by the solid ball (except the first one, which must have been killed by a splinter of the ball ranging forward or upward into the kidneys or back veins), and one half-grown fawn that I was almost ashamed to shoot at, after having four hours time to lie down, was about as lively as ever, and actually got away from me. Four struck in the hip, like the third one mentioned above, got away. The solid ball would have gone clear through and broken both hips, whereas it simply made a large flesh wound in one, and leaving the other strong enough to travel on faster than a man can.

This lack of penetration is the most serious drawback of these balls. If made to take a .22 long cartridge there is little left to the ball, the expansion retards it very materially and the explosion still more. The difference in penetration is immense, several balls having failed to pass through both shoulders of a deer, where the same ball, if solid, would go through two or three deer. They should consequently be made hollow not over half their length, and I think only two-fifths better still.

I have come to the conclusion that the best way to use these balls is without any powder, or anything but wax to close the hole, and east of hardened lead like the Creedmoor ball, with the hole made small and narrowing nearly to a point at its bottom. This may seem absurd; but I am not theorizing, and after a thorough trial of each have abandoned the explosive part of it until I can find something far more explosive than black powder, that is also safe. The advantages of such a ball are these: First, it will not fly to pieces, but by remaining together will retain its momentum and have greater penetration; second, by expanding without tearing off its walls it will cut a hole of greater average width throughout its entire passage; third, a short, swift ball may in this way be made to do capital work, whereas, if explosive, it must either be made so heavy that the intolerable nuisance of low initial velocity, and consequent shortening of the natural point-blank must be submitted to, or else it made light it will have little penetration upon the solid parts of any large animal. Another objection is this: Game at long ranges will often stand for one or two "sighting shots." The explosion of a ball around their feet will (unavoidably to my experience) make them run far enough to ruin your calculations for the next shot, whereas they will often stand or jump only a step or two for a solid ball.

In "Hallow's Gazetteer," page 546, note, is an account by a Mr. Mead, of the top of the skull of a 1,000 pound grizzly being torn off by a ball containing .22 long pistol cartridge. I regret I differ from anything ever quoted (without being indorsed) in such excellent authority; but there is a mistake here which may mislead some brave sportsman into serious danger. Either that ball contained dynamite or fulminate of mercury—things far too treacherous for safety—or the ball struck in such a way that it would have shivered the top of the skull anyhow, or the account has passed through two or three months, or the observer's expectations of what would occur have, by a well known law of human nature, led him unconsciously to exaggerate what did occur. At all events I do not hesitate to pronounce it an entire mistake as it stands. I have fired precisely the same cartridge into the head of a wildcat, into the shoulders of a coyote and fox, into a black eagle, and as a quailing shot into the heads of several deer, besides the instances before cited. In no case was there any sign whatever of blowing, tearing or shattering either of bones or skin, except where the ball came out, and there the hole was precisely the same as is made by the ball without any powder or cartridge in it. The only way I can explain this is that black powder is too slow; that while it will tear a tender thing like a hare in pieces, where the object is tough the gas escapes partly behind the ball, which it can easily do, owing to the wedge-shape of the hole, and partly through the hole which is cut for it by the ball in front, which is done just about as quick as the gas can fill it.

In order to test this question thoroughly, I bored out some balls with a bit, so as to take a .32 long cartridge. These contain about twice as much powder as the .22 cartridge. The bullets of these balls were so injured in shape by the rise that I did not try them on deer, for I doubted their accuracy. A melodious old 12-pound tom-cat, of whose inspiring eloquence the ranche was weary, furnished, however, a far better test. I shot first at his middle, but struck too low down, about an inch from the lower edge. The skin was torn for several inches on each side, the heart and lungs laid bare, and the cat killed in about a minute. I then fired another into the back between the shoulders. It came out between the fore-legs, making a slightly larger hole than the merely expansive bullet would have done; but there was no tearing or blowing apart of the shoulders whatever, nor was the skin anywhere broken except where the ball entered and passed out. Another fired into the head produced exactly the same effect, viz.: cutting a larger hole on the exit side, but without blowing open anything. I then fired one into a piece of dry cottonwood log, eight inches in diameter and twelve inches long, free from knots and straight grained, and the mate to which required only one good blow of an ax to split. The piece was not split or shattered in any way. In opening it with an ax I found the ball had penetrated about five inches, and was torn to bits. This seemed to confirm what I had noticed before with the smaller cartridge, that the gas can, in a tough substance, escape entirely out of the hole the ball entered. I then took another piece of cottonwood, only five inches in diameter and ten inches in length, and perfectly straight. The ball passed entirely through this, cutting a little larger hole on the other side than the simply expansive bullet would have done, but I failed to find any sign of a crack or split in the block from the explosion.

In none of the instances given has there been any question as to whether the ball exploded or not. I have never yet known one to fail. The blackening and smell of the powder is always more or less noticeable, especially in wood, and at over sixty yards or so the explosion may be plainly heard like a fire-cracker.

The conclusions to which I have come to are these:

That these balls are a great improvement over solid balls of same calibre (except where great penetration is needed, when they are decidedly inferior), but do not wholly overcome the objections to small calibre.

**NEW CRAFT.**—The builders are designing and constructing quite a number of new yachts for the coming season, among which we hear of a schooner-yacht about the size of the Comet, which Mr. Sam Pine is to build for Mr. Pierre Lorillard. Mr. Pierce, of the Atlantic Club, has contracted with Mr. Gorman, of Brooklyn, for a centre-board sloop-yacht, forty-six feet long. Mr. Gorman is also to build a sloop-yacht, forty-eight feet long, for Mr. John Dimon, of the Brooklyn Yacht Club, who has just sold his sloop, the Wave, which Mr. Gorman built for him last year. Mr. Fred May and his brother, of the Seavanhakas, have a sloop-yacht 31 feet long, 11 feet beam and 3 feet 10 inches deep, built by Mr. John Munn, of Brooklyn, from a model by Mr. A. Carey Smith. The same builder has also nearly ready for launching a centre-board sloop-yacht for Mr. James Smith. She is 33 feet long, 13 feet beam and 3 feet 7 inches deep. Mr. Munn has built since the close of the last season three cabin yachts, 29, 26 and 23 feet long respectively, and three open racing yachts, 20, 18 and 16 feet long respectively. All these six he has on hand ready for purchasers at the opening of the season. Mr. Rhodes, of Brooklyn, has nearly completed a 28-foot racing yacht, which he has built for a member of the Atlantic Yacht Club. Mr. Jacob Schmidt, the builder of the Pluck and Luck, Dare Devil, etc., is building a catamaran. As he has sailed frequently in the John Gilpin, his proposed boat may be expected to embody all the advantages of the Herreshoff model with any improvement which may suggest itself to a builder like Mr. Schmidt. Mr. J. Lennox, Brooklyn, is building for Mr. J. Buchanan Henry, of Staten Island, a centre-board yacht. Her dimensions are 37 feet long, 14 feet beam and 5 feet deep. She will be cat-rigged, but the main boom will not come to the taffrail, and abaft it she will carry a jigger. Mr. William Watts, of the Williamsburg Yacht Club, has nearly complete, at Greenpoint, a centre-board sloop-yacht 42 feet long, 17 feet 6 inches beam and 4 feet 6 inches deep. Mr. Richard Wallin, at the foot of Court street, has completed a racing yacht for ex-Commodore Noble, of the Columbia Yacht Club.

**THE DAUNTLESS SOLD.**—James Gordon Bennett has sold his famous schooner-yacht Dauntless to a member of the New York Yacht Club, for \$15,000.

—The steam-yacht which is building for Mr. Dion Boucault is to be of iron, and is being constructed at Chester, Pa.

—Mr. J. Buchanan Henry's new yacht will be called the Cruiser. It will fly the pennant of the New York Yacht Club. She is thirty-five feet over all.

—Mr. O. Iselin has sold his racing yacht Dare Devil to Mr. Dillworth, of Hoboken, and she will be enrolled in the New Jersey Yacht Club.

—Mr. John Dimon, of the Brooklyn Club, has sold his sloop-yacht Wave to Mr. E. B. Underhill, of the same club.

**BROOKLYN YACHT CLUB.**—At the regular meeting of the Brooklyn Yacht Club, Jan. 9, the following officers were elected for the ensuing year: Commodore, J. Lester Wallack, of the schooner-yacht Columbia; Vice-Commodore, Rear-Commodore, John B. Norris, of the sloop-yacht Sadie; President, Charles W. Blossom; Secretary and Treasurer, William T. Lee; Asst.-Secretary, George G. Dunning; Messrs. John W. Sawyer; Fleet-Surgeon, Samuel Hall, M. D.; Judge-Advocate, Henry O. Place; Trustees, Samuel McElroy, D. S. Hines, W. R. Wadsworth and Geo. R. Randolph; Committee on Membership, B. L. Blood, W. R. Ringwood and F. W. Jenkins; Regatta Committee, H. W. Turner, Henry Hentz and R. J. Cortis.

**QUAKER CITY YACHT CLUB.**—This club, of Philadelphia, has elected the following officers for the ensuing year: Com., A. F. Bancroft, of the yacht Lillie; Vice-Com., L. Coleman, of the yacht S. Joseph; Rear-Com., Paul Klotz, of the yacht White Wing of Chester, Pa.; Pres't., N. B. Boyd; Sec., Chas. S. Salin; Asst.-Sec., J. J. Baughman; Treas., Robt. Baird; Meas. Capt., Jno. C. Vanderslice; Regatta Com., Chas. S. Austin, Jno. S. Pomeroy and Jno. M. Seigel.

**LECTURES ON NAVAL ARCHITECTURE.**—Mr. A. Carey Smith, the well known yacht builder, is delivering a course of lectures before the Seavanhaka Yacht Club, on the modelling and con-

struction of yachts. The first of the series was given at Delmonico's last Saturday evening, and was upon the sheer, half-breadth and body plans of a yacht. The speaker illustrated his lecture with capital black-board drawings. The next lecture, Jan. 26, will be upon the calculations involved in yacht-designing, tonnage, draught, etc.

**TOURIST.**—The steam-yacht Tourist, owned by Commodore Charles A. Chesborough, of New York, Capt. J. S. Simmons in command, arrived at Wilmington, N. C., on the 12th inst., en route for Jacksonville, Florida.

**NATIONAL ASSOCIATION OF AMATEUR OARSMEN.**—At the annual meeting of this Association, held in this city last Saturday evening, Alexander Krumbhaar, of the Philadelphia Barge Club, of Philadelphia, Pa., was elected chairman. There were present the following named gentlemen: O. M. Bevington, Narragansett Boat Club, Providence, R. I.; Robert L. Reade, Nassau Boat Club, New York; H. E. Buermeyer, Athletic Club, New York; H. W. Garfield, Mutual Boat Club, Albany, N. Y.; T. W. Kennedy, Passaic Boat Club, Newark, N. J. The next regatta will be held next August at Newark, on the Passaic River, the Newark citizens to place \$500 in the hands of the executive Committee, as a guarantee, before the second Saturday in June, the next regular meeting of the Association. There was a lively discussion upon the attempt to disqualify the Dauntless and Columbia College crews for rowing last October against the Argonauts. The latter contained a professional, Mr. Ed. Smith, and a rule of the Association is that any man rowing in a contest where there is a professional shall be from that time excluded from the Association. No club has made any application for the dismissal in this case, and nothing was done. The Atlanta sent in their resignation, and it was accepted. Messrs. Reade and Buermeyer were appointed to draw up a definition of "junior sculler."

**BOATING AT HARVARD.**—For the University crew of 1878 twelve men are now in training. Of these six were in last year's crew, namely: Bancroft, Captain, '78, Cambridge; Smith, '79, Worcester; Schwartz, '79, Bangor, Me.; Crocker, '79, Fitchburg; Brigham, '80, Salem; Littauer, '78, New York City; Allen, the last year's coxswain, is to be coxswain for the coming race. The new men are Stowe, '80, San Francisco; Parker, '78, Lancaster; Trimble, '80, New York City; Taussig, '79, St. Louis. From these Mr. Bancroft feels he can select a capital crew. The weight of the candidates averages about 187 pounds. Their average age is 20 years, which is about the age of the average Harvard crew. In their race with Yale the crew will use a paper boat of the same length and build as that of last year. Harvard is also well satisfied with the present system of eight-oared crews that she will probably not return to the six-oared system. The interest in boating is not nearly so strong as it was a few years ago. The 1,400 students connected with the University furnish only twelve candidates for places on the crew, and the enthusiasm of the club crews is in a sad state of decline. Their prospects, however, in the coming race are as encouraging as ever they were, and under the energetic and efficient control of Capt. Bancroft we shall expect a good record from the Crimson next summer.

**OXFORD'S CHALLENGE TO COLUMBIA.**—Oxford University has challenged the Columbia College four to row a race from Putney to Mortlake for the college championship of the world. If the Columbia crew defeats Oxford a second race with Cambridge is proposed. The Columbia boys very sensibly disclaim representing anything more than their own college in this contest, and while expressing their willingness to let all America and all American colleges participate in her victory if she wins, they do not wish to involve any other oarsmen in their defeat.

**ATLANTAS.**—At the thirty-first annual meeting of the Atlanta Boat Club, of New York—the oldest rowing club in American waters—the following officers were elected for 1878: Pres., George B. Dean, Jr.; First Vice-Pres., Frederick H. Clark; Second Vice-Pres., Edward C. Ripley; Sec., John E. Eustis; Treas., Henry S. Sprull; ex-Pres., J. H. Kent; Board of Trustees, ex-Pres. Ransom Parker, Jr., John Kirk, Seth H. Noyes, A. Byron Cross, Charles Devoe; Lieutenant, George W. Young; Log-keeper, P. Brennan.

**TRITONS.**—The officers of the Triton Boat Club, of Newark, N. J., for the ensuing year are: Pres., A. W. Conklin (Mr. L. E. Saunter declining a reelection); Vice-Pres., J. W. Morrill; Sec., Caleb Crockett; Treas., Frederick H. Shipman; Capt., Frank Phillips; Lieut., Frank M. Peters; Log-keeper, Charles B. Campbell. Messrs. H. C. Rommel, C. Glaze, J. O. Littell and J. W. Van Ness, were chosen trustees.

**ETREKAS.**—The Eureka Boat Club, of Newark, N. J., has elected the following officers for the ensuing year: Com., John Young; Pres., George Clark; Vice-Pres., Watson Ryno; Sec., Manning Forde; Treas., John P. Contrell; Capt., Peter Young; Lieut., Fred Fisher; Log-keeper, Adam Groel.

—The annual meeting of the New York Yacht Club will be held Feb. 7th.

**ECCENTRIC.**—East Newark, N. J., has a new boat club called the Eccentric; Pres., Whitefield Still; Vice-Pres., Sidney Askey; Sec., E. E. Smith; Treas., Frank Hedden; Capt., John Evans; Lieut., George McClure; Log-keeper, John P. Mead.

**DETROIT BOAT CLUB.**—This club has now a total membership of 231. The log shows a total of 625 miles rowed in 191 trips. Officers for the ensuing year: Pres't., Henry Russell; Vice-Pres't., Addison Moffat; Sec., C. L. Andrews; Treas., H. M. Campbell; Capt., John M. Hinckman.

**THE ENGLISH CHAMPIONSHIP.**—The rowing-match for £200 a side and the Newcastle Chronicle championship of England Challenge Cup between John Higgins, of Shadwell, and Robert Boyd, of Gateshead, on the River Tyne, from High Level Bridge to Scotswood Suspension Bridge, Jan. 14th, was won by Higgins on a foul.

### New Publications.

**UPLAND GAME BIRDS AND WATER FOWL OF THE UNITED STATES:** by A. Pope, Jr. Published by Scribner, Armstrong & Co., New York, 1878.

As publishers of one of the leading magazines in the United States, Messrs. Scribner, Armstrong & Co. have in a measure revolutionized American illustrative art. In Upland Game Birds and Water Fowl, these enterprising publishers have shown their capabilities of carrying out successfully a new branch of art. Familiar as we should be with ornithological books, of which Audubon is the most remarkable in a pictorial sense, the publication now under review certainly forms an era in illustrative natural history. Mr. Pope's work may be described as exactly that happy conception of artist and sportsman combined, where the form, contour and general color of the bird is caught. We may remark just here that the naturalist *pave el simple*, does not often possess the true artistic feeling. If it is a fish he draws or paints he necessarily proceeds in a quasi Chinese manner. He depicts every spine, every scale. If it be a bird he wishes to portray, each wing feather must find its place, and he is inclined to insist on the distinctions of *plumula*, *semiplumae* or *filoplumae*. In his anxiety for absolute scientific accuracy, artistic effects and finish are sacrificed. That admirable collection of forms of plaster fish, with their exact colorings, due to the labors of the Smithsonian Institution, are rigorously correct. An ichthyologist would delight in such an assemblage of fish, but the artist would find but little pleasure in them. The aesthetic principle is what is wanting. A carefully modeled wax figure recalls the man, but a statue or picture embellishes, through the taste or genius of the artist, the human form. Mr. Pope is an artist in water colors, of marked merit, who has given careful study to the birds he paints, and Messrs. Scribner, Armstrong & Co. have taken his sketches and reproduced them in colors. Each illustration is mounted on card-board some 22x23 inches. There are two such pictures in each number, and the letter press is printed on heavy paper, the descriptions being compiled from Wilson's American ornithology, Audubon's Birds of America, Baird, Coues and all well-known authorities. The two pictures in the present number show the American Snipe and the Green Winged Teal. As much care has been taken with the birds as with their surroundings. In the snipe the round pretty head, the lustrous eyes of the *Gallinago wilsoni* are carefully hit off. Effects of plumage are wonderfully truthful. In the illustration of the teal one bird is down and hit hard, while the mate bird, with affrighted wing, shoots off like a bullet through the edge and underbrush which fringes the water side. We can hardly fancy more agreeable pictures for the sportsman or naturalist than to take these illustrations and to place them either in a portfolio for reference, or having them framed to ornament his walls with them. As to what is called "registering" in color printing these pictures are absolutely perfect, and those not familiar with this art will wonder how by mechanical means such exact copies of the painter's skill can be produced. Upland Game Birds is to be published in ten parts, five of which are now announced, and will be sold by subscription, and then only for the entire series.

**THE AMERICAN NATURALIST.**—The recent change in the ownership of this journal has developed, as might have been expected, no little dissatisfaction among leading naturalists, who seem to think that its usefulness is thereby greatly diminished. Heretofore many of our best known workers in science have contributed to its pages, and it was regarded as an impartial medium for communication with the public; but the feeling against the change is so strong that it is resulting in the gradual withdrawal of those who have hitherto been its most influential supporters.

**BOOKS RECEIVED.**—American Ornithology: Natural History of the Birds of the United States, by Alexander Wilson and Prince Charles Lucian

Bonaparte. The illustrative notes and life of Wilson by Sir James W. Jardine. 3 vols. Illustrated in colors. New York: J. W. Bouton, 706 Broadway. 1877.

**MESSRS. TIFFANY & CO.,**  
UNION SQUARE, NEW YORK  
City, have made extensive preparations for the approaching  
HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

mier," 12 bore, 30-inch, 8 lbs. (all im-  
provements.) C. L. RITZMANN, 943 Broad-  
way, N. Y. j17 47

FOR SALE.—A London gun, in perfect order, and  
an extra shooter, 7 lbs., 12x28x21x14. Also, a  
Gordon xzp, splayed, three years, well broken on  
woodcock, partridge and ruffed grouse. A rare  
chance. Address Dr. J. P. McLEERY, Milton, Pa.  
j17 47

FOR SALE OR EXCHANGE.—A fine English  
double breech-loading rifle and shot combined,  
pistol-grip stock, 45-100 calibre, 12-bore; also a very  
fine English double breech-loading shot-gun, 12-bore,  
20-inch barrels, laminated steel. Will exchange for  
a very large bore breech-loading duck gun, or sell  
cheap for cash. Address, FLORIDIAN, Office Pon-  
est and Stream. j17 47

FOR SALE, CHEAP.—Two first-class breech  
loading shot-guns, 10 and 12-gauge; been used  
but little, and all as good as new; sold only as I have  
no time to use them. Address JOHN TOMKINS,  
Kennebunk, Me. j3 37

SECOND-HAND.—A very fine Tolley breech  
loader, with two sets of barrels fitted to same  
stock; one pair 10-bore Damascus and very close  
shooting, other pair laminated steel and cylinder  
bore; weight, 9 lbs. and 9½ lbs. This gun was  
made to order for the owner, and is very superior in  
every respect. Can be exchanged at gun store of  
HENRY C. SQUIRES, 1 Cortlandt street, N. Y.  
Nov 17

#### Wanted.

WANTED.—An eight-gauge double breech-loader.  
Address, with description and price, S. E. D.,  
Office of "Forest and Stream." j10 47

### HIGHEST HONORS AT THE Centennial World's Fair, 1876! THE SHONINGER ORGANS

### PRONOUNCED UNANIMOUSLY AS THE Best Instruments.

Their comparative excellence is recognized by the  
Judges in their Report, from which the following  
is an extract:

"THE B. SHONINGER ORGAN CO.'S exhibit  
as the best Instruments at a price rendering them  
possible to a large class of purchasers, having a com-  
bination of Reeds and Belts, producing novel and  
pleasing effects, containing many desirable im-  
provements, will stand longer in dry or damp climate, less  
liable to get out of order, all the boards being made  
three-ply, put together so it is impossible for them  
to either shrink, swell or split. THE ONLY  
ORGANS AWARDED THIS HONOR."

There are 50,000 of our Instruments in this and  
the European countries in use, and they are so made  
that they will keep in tune, and stand any climate.  
They contain a magnificent Chime of Bells, tuned in  
perfect harmony with the Reeds, producing won-  
derful effects. The Music Rack, when tuned forward,  
will make a splendid writing desk, with our Book  
Closets and Swinging Lamp or Flower Brackets, with  
a fine stool box free with each Organ, makes the  
SHONINGER ORGANS the most substantial, con-  
venient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few  
agents.

A liberal discount to the Clergy, Sunday Schools,  
Teachers, Churches and Lodges.

Armory, 211 Fourth Avenue, near 17th street.  
Diplomatic corps, army and navy officers and  
members of the National Guard will appear in uni-  
form. j17 47

## W. W. Greener's CHOKE-BORE GUNS,

Tried on Game in America.

Supplied by H. C. Squires, 1 Cortlandt St.

NEW YORK.

See the Following Testimonials:

SR-1 is a pleasure for me to inform you of my  
high appreciation of the 10-lb. Greener breech-loader  
purchased of you last winter. I consider choke-  
boring, if skillfully done, as the greatest improve-  
ment in fowling-pieces since the introduction of the  
percussion cap. It gives the maker complete con-  
trol of the pattern, and greatly increases penetra-  
tion. To prove this, I will give you the performances  
of this gun. The 32-inch 10-gauge barrels, charged  
with 4½ drachms of powder and 1¼ oz. No. 6 Eng-  
lish pulled shot, gave patterns ranging from 285 to  
330 pellets in 30-inch circle at 10 yards. The same  
charge of powder and 1¼ oz. No. 4 American shot  
gives 160 to 175 pattern, with penetration which kills  
ducks at 50 to 75 yards like a stroke of lightning. It  
is a characteristic of the choke-bore to give its  
greatest superiority in the large sized shot. What I  
am about to say will perhaps surprise you as much  
as the performance surprised me. On trial of the  
12-gauge 28-inch modified choke-bore barrels, with  
3½ drachms of powder and 1¼ oz. of shot, I got  
about the same pattern and spread of shot at 25  
yards as with the full choke 10-gauge barrels at 40  
yards, with tremendous penetration. This is just the  
performance required of a gun for thick cover, in  
which you generally find ruffed grouse, woodcock  
and quail, these birds being killed, with few excep-  
tions, at from 15 to 25 yards.

COL. JOHN BODINE.

DEAR SIR:—The guns arrived all right. Whether  
these last guns you have sent us will place the  
Greener guns ahead of any other in this country, as  
guns of other makers don't compare in shooting  
qualities with them. We unhesitatingly recommend  
the Greener as far superior to any gun of foreign or  
domestic manufacture that we have seen. We say  
this after seeing and using guns of all the most cele-  
brated makers. CARLISLE, JONES & CO.  
SEIMA, Ala.

The Greener gun presented by Mr. Squires for the  
best pointer, and awarded to me, is a clean, clean,  
hard hitter, killing its game at very long distances.  
It is the second Greener that I have owned and they  
cannot be beaten. I win with them at the trap or  
in the field. S. B. DILLEY.

SR-1 have a pair of W. W. Greener's breech-  
loaders (bought of H. C. Squires, of New York),  
modified choke-bore. I have had an opportunity to  
test these weapons on birds heavily feathered, and  
where great penetration was essential to success. I  
have repeatedly made long shots, always killing the  
game clean. At a target both guns made a very  
even distribution of the shot, with extreme penetra-  
tion.

SR.—The Greener breech-loader I purchased of  
you is very fine indeed, and gives great satisfaction.  
WARREN, Pa. ROBERT DENNISTON.

W. W. GREENER, St. Mary's Works, Bir-  
mingham, England.

## THE

CHOKE-BORE  
MATCH.

W. W. GREENER begs to inform his numerous patrons in America that his gun has again come off victorious at the great match of Choke-Bore vs. Cylinder Bore, at the London Gun Club, on May 23, beating seventeen of the best shots in Great Britain who used guns by the best London makers, viz.: Four made by Grant, three by Purdy, three by Douglas, one by Lancaster, Boss and others.

[See London Field, May 26, Editorial Remarks.]

"Mr. Cholmondeley Pennell, the winner of Mr. Purdy's massive fifty guinea cup, weighing over 91 ozs., for the highest score, shot wonderfully well, killing all his birds at 30 yards with the first barrel. The gun he used was a full choke, by Greener, of Birmingham. The result of the trial served to show the superiority of the choke at the long range. Mr. C. Pennell cutting down 10 birds in a marvellous way with his heavy greener."

W. W. GREENER,

St. Mary's Works, Birmingham, and  
63 Haymarket, London.Rea d'Choke-Bore Guns and How to Load," by  
Cassell, Pott & Galpin, New York.

## Fishing Tackle.

W. H. BAKER &amp; CO., Syracuse, New York.

IRA A. PAINE'S  
CHAMPION FILLED GLASS BALL.

PATENTED OCTOBER 23.

MAKE THE FEATHERS FLY WITHOUT KILLING THE BIRD—SOMETHING  
MUCH NEEDED.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known Sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Glass Ball, which we hold the exclusive right to make and sell. They will eventually be the Standard Ball. Out of One Million already sold, not one complaint. No Fancy Price, but a fair profit. Every ball is warranted to give satisfaction. The number of orders from all parts of the country speak volumes.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

Bogardus' Patent Rough Glass Balls  
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8.

HEADQUARTERS FOR BALLS, HAGGETT BROS., 10 Platt Street.

FOR TRAPS, GEO. E. HART &amp; CO., Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," containing instructions for Glass Ball Shooting, will be ready Feb. 1. Price \$2, by mail, postage paid. Address,  
Capt. A. H. BOGARDUS, International Hotel, N. Y.

## Sportsmen, Attention

## Keep Your Feet Dry.

The only premium awarded by the Centennial Commission, Philadelphia, 1876, for Alligator Waterproof Boots and Shoes.

Goods sent to all parts of the U. S.,  
C. O. D.

Catalogues containing full instructions for  
self-measurement sent free on application.

503 Broadway, New York.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$8.50. Also the best brown corduroy pants at \$10 per pair, make only the one grade, as the cheapest goods do not turn briars and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Yet. Coat, \$15.00. For full Suit, \$14.00. I also make the Sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

F. L. SHELDON, Rahway, N. J.

For Sale by Dealers in GUNS and SPORTSMEN'S SUPPLIES.

## A PEERLESS OFFER.

IN ORDER TO BETTER INTRODUCE

KIMBALL'S

## PEERLESS.

FINE CUT CHEWING TOBACCO,

The manufacturers beg to announce that they will deliver, free of cost, to every dealer buying a Ten Pound Pail, one genuine

Blue Jacket  
SEVEN SHOOTER

With Safety Lock, Steel Barrel and Cylinder, Nickel Plated, guaranteed reliable and perfect in every respect, and usually retail at \$6.00 to \$5.00, which the dealer WILL PRESENT to the CUSTOMER BUYING the LARGEST Quantity of PEERLESS.

Peerless tobacco has been manufactured for more than thirty years, and has become a favorite wherever used. In quality it is unsurpassed, and a first-class article in every respect. Five First Prize Medals have been awarded, including the Centennial, and the only award at Vienna, 1873, to date. The manufacturers challenge the production of a better article.

Parties desiring to avail themselves of this opportunity of procuring a good article of Tobacco, which alone is worth the money, and a first-class Revolver, nearly equal in value, should forward their order as soon as possible, as a limited number only will be given away. Price \$9.00 per pail.

### CATASTROPHISM.

TO PROFESSOR O. C. MARSH, BY A NON-UNIFORMITARIAN.

BREAK, break, break,  
At the cold gray stones, O, O!  
And I would that my tongue could utter  
The thoughts that arise in me.

O, well for the five-toed horse  
That his bones are at rest in the clay,  
O, well for the ungulate brute  
That he roams o'er the prairie to-day!

Thy rocks bear their record of life,  
Evolved from Time's earliest dawn;  
But oh for the view of a vanished form,  
And the link that is missing and gone!

Break, break, break,  
At thy fossils and stones, O, O!  
But the gentle charm of Uniform Law  
Can never quite satisfy me.

—San Francisco Bulletin.

### Voyaging on the Upper Missouri.

By ERNEST INGERSOLL.

NO III.

EMBARKATION AT FORT BENTON—SKETCH OF THIS NAVIGATION  
—"SPARRING" A SAND-BAR—A SCRAMBLE FOR BREAKFAST—  
SCENERY AND INDIAN LEGENDS—THE PICTURESQUE DESOLA-  
TION OF THE BAD-LANDS.

NOW let the imaginative reader conceive us to have picked our way at sunrise down among the redoubts of freight on the bank of the river, walked the treacherous gang-plank and climbed the hurricane deck of the Benton—a good and comfortable steamboat, stern-wheeled, 395 tons burthen, Capt. McGarry—and that we are headed down stream, with the historic town just out of sight around the bend, and the leadsmen calling lustily the decreasing depth as we approach the dreaded Shonkin bar. Moreover, let him fancy himself greatly entertained by something a certain person is instructing him upon, namely, steamboat navigation on the Missouri.

It was not until 1811 that the waves of the Mississippi were parted by a steamer's prow, but long after this novelty had ceased, the upper Missouri was shunned as utterly impracticable for steamboats, so that as late as 1830 we find the American Fur Company clinging to its keel-boats, and dragging its goods by human labor the long and toilsome distance from St. Louis to the mouth of the Yellowstone. But in that year it was determined to try a steamboat on the Upper Missouri. It was supposed that unusual strength and solidity were essential to encounter successfully the dense array of snags and bars, and in 1831 a new side-wheel boat named "Yellowstone" was specially built. This boat succeeded in reaching Fort Pierre the first season, and Fort Union the next, but was found to be of improper build, and was soon replaced by the "Assinibogue," which was far more successful. That she might produce a more startling impression upon the minds of the Indians, she was provided with an apparatus through which the steam could escape with a terrific and unearthly din, and at her bow was a large carved figure representing an Assiniboiné warrior. One of her passengers on the first trip was Mr. Catlin, the painter and student of aboriginal life. The following winter this boat was frozen in above Fort Union, and the next season burned by accident. The American Fur Company subsequently owned a considerable number of steamboats, and every year saw one or more ascend to the mouth of the Yellowstone. Several attempts were made to push yet higher up the river, but with indifferent success, until in 1860 the light-draft steamboat Chippewa ascended quite to Fort Benton. To the Choteaus, father and son, is due the credit of this achievement.

Meanwhile we are dropping down the river, and Shonkin bar has been passed with small difficulty. This is August 17th, and the last boat of the season, hence we have grounds for fear of getting aground. The Missouri depends wholly on the melting of snow. Its highest stage is therefore in June, when the summer has begun seriously to be felt in the mountains and tablelands. After this, as less and less snow is left to be melted, the flood decreases, and in September and

Selected.

October the river is very low. The latest departure from Fort Benton on record is August 27th, and we esteem ourselves fortunate in getting a boat at this date.

When a boat fails to pass a bar after proper trials—finds herself well aground—she resorts to "sparring." At each side of the extreme prow, on the lowest deck, and therefore almost at the surface of the water, stand two stout masts about 40 feet high, inclining slightly forward and firmly stayed. To each of these is suspended, by strong tackle at the top, a spar of equal length and heaviness with the mast, so arranged that its lower end, which is shod with an iron spike, can be dropped into the water on either side of the bow. Now when a sand-bar is under the keel, and refuses to yield, the spars are dropped and the iron point sinks firmly into the sand. Then the tackle is put upon the captain, the donkey-engine puffs and pants as though it was doing it all by a personal exertion of human strength, the tackle winds up in a vain attempt to force the spars down into the sand, which of course results in lifting the steamboat up and dragging it forward to the extent of the length of the spars, which now lie prone alongside ready to be readjusted and pulled against the second time if necessary. It is just as though you had put your hands on a fence and leaped through them.

From the contemplation of this feat in navigation we returned to breakfast at the ringing of the bell. Entering the cabin I found it occupied by a long table for passengers, and a small table for the officers. The ladies on board—of whom there were a score or more, mainly wives of Montana merchants going East to spend the winter—had been seated before the bell was rung, else they would have had small chance I fear; for the seats were not half as many as the passengers, and there was a grand scramble for the first table. I could enjoy it since, though the courtesy of Mr. Barr, clerk of the boat, I had been given a permanent chair at the officers' table. The breakfast was a good one—far better than ordinary Montana hotel fare in point of both material and cooking, and after a day or two the scramble ceased by an amicable arrangement, so that the three substantial meals were thoroughly enjoyable every day. The Missouri flows through a hungry latitude. Men must eat, and are quick to discharge the duty.

While we ate at this breakfast the deck-hands took on a lot of silver bullion which had been brought down from Fort Benton in wagons, since it was too heavy to trust to the boat to carry over Shonkin bar, and the great red "schooners of the plains" were bivouacked on the bank, beside each one a little fire, where groups of teamsters in picturesque roughness of attire sat eating their breakfasts. On the way up the boat left a quantity of heavy freight here, and this the wagons will carry up to the fort this afternoon.

The bluffs here are about a mile apart and perhaps 200 feet high. They are of clay, light colored, black at the base and much gullied by water. Between these the river winds about, the bends being taken up by grass or willow clothed flats, with occasional islands densely overgrown by willows and large cottonwood trees (*Populus*), looking very green in contrast to the universal gray, yellow and brown. Twenty-five miles below Fort Benton a widening of the bottoms, broad islands of sand, and a long line of trees under the abrupt northern shore, indicated the delta of the Marias, a large tributary from the Northwest. On these bluffs a trading-post was built as early as 1831, by James Kipp, an American Fur Company's agent, whose name is perpetuated in some rapids below, and whose son led the famous Baker Massacre against the Piegiens. The river is a limpid stream, flowing over a pebbly bed, the bottoms being lined with a heavy growth of trees and bushes. A little way up this stream occurred a most sanguinary conflict between Gros Ventre and Crow Indians in 1849. Twenty-two Crows were concealed in a hollow for the purpose of stealing horses from the Gros Ventres' camp, consisting of two hundred lodges. Being discovered, the Gros Ventres surrounded them and threw up dust in the air, which was carried by a strong wind in the faces of the Crows, blinding them, when the Gros Ventres rushed upon them and killed the whole number without losing a man. Among the Crows was a Gros Ventre who had been taken prisoner in early life. He begged for his life, told who he was, but against him, very properly, they executed their wrath, telling him he had no business to come on such an errand against his own people. The Crows fought bravely; one of their number, with knife in hand, jumped down a hill some

sixty feet, but was despatched before he could do any injury. None were left to carry home the news.

This point passed, the right bank of the river continued high, the bluffs throwing strong shadows; but the left (northern) shore became sloping and grassy, permitting glimpses out upon the plains, which were devoid of much interest except when groups of antelopes would raise their pretty lyre-crowned heads to gaze at us from the top of some ridge, or scamper nimbly away as we came round a bend. The sun was very hot, and the passengers soon abandoned the deck to arrange their diminutive staterooms, sleep, read or attend to some of the seventeen babies that formed our musical corps, making the boat resemble at times an Indian village lamenting the death of its chief.

Toward noon Bear's Paw came in sight off to the north, between us and Milk River, a range of sharp pointed granite hills, with pine forests on top that look like tossing waves. The road from Minnesota to Oregon passes along their further slopes, where the aspect of the range is said to be stern and wild. The home of the Gros Ventres, once a very powerful nation, but now decimated through continual warring, Bear's Paw has been the scene of much Indian fighting; and even as I write comes the news of the Nez Percé Chief Joseph's defeat at the hands of General Miles in this very spot. Very lately gold has been found there, and emigration must soon possess itself of the woods and valleys. Beyond are the Sweet Grass Hills, with their fragrant herbage, the resort of the Blackfeet, who aver that Providence created these hills especially for this tribe to use as lookouts for buffalo.

Where the river passes through these hills the poor quality of coal underlying all this vicinity crops out in the bluff and has been mined to a small extent. Some day it will no doubt prove highly valuable for the use of steamboats. On a prairie bottom just below you notice a little ruined stockade overgrown with weeds and bushes. A year ago a "whisky trader" was killed there in a quarrel with a young Gros Ventre about a squaw. Such events are the prime cause of many an Indian war. The whisky traders are the curse of the Northwest—they are unlicensed peddlers of literal fire-water, who sneak about eluding the revenue officers and frontier troops as long as they are able. The almost invariable result of their illicit trade is violent death at the hands of some drunken savage.

The next sign of humanity was presented by Eagle Creek City, which consisted of two small log-houses, joined together by a continuous roof. We landed the citizens, to wit one man, who will stay here all winter cutting wood for the steamers; a dog, a cow, a wall-eyed horse and some provisions. It was near here that a well-known old trapper, Louis V. Mercure, drowned himself in a moment of dejection, and his lone grave is marked by four mossy posts. This is sixty-five miles from Fort Benton, and we have fairly entered the Bad Lands, by far the most picturesque portion of the whole river scenery.

In place of the yellowish and bluish cliffs, whose square fronts and crowning slopes of sere-grass had already grown monotonous, there now appeared on the northern bank a continuous array of lofty bluffs deeply eroded, and devoid of vegetation; while on the southern bank such bluffs were interspersed by open spots and grassy knolls. The earth of these steep and rugged bank was nearly as white as lime, except where protrusions of igneous rock made a black and desolate blot upon the already cheerless landscape. The bluffs rose to a height of several hundreds of feet by successive ledges, and here and there some tower of lava, tougher than the sandstone through which it had been thrust, would stand as a ruined monument of the decay of the general level. But even the lava dikes, being porous and seamed by lines of cleavage, crumble under the strokes of Time and Weather, but crumble unequally, leaving unexpected and fantastic images—freaks of those merry carvers, Frost and Water—to stir the fancy of the beholder. At one point the river flows between two high promontories of lava that stand opposite like gate-posts, rising a hundred feet perpendicularly from the water's edge. Such ruined dikes strike across the hills in every direction, standing from 10 to 100 feet above the surface, and dividing the region into great irregular fields as though with stone fences laid by Cyclopean laborers. Here and there these workmen of Vulcan have erected the dwellings, fortifications and public edifices of their ancient town. You

even fancy you can see them, turned to stone as they toiled—men with cows on like gnomes, women wearing broad-brimmed hats resembling mushrooms. On that white, dome-shaped hill stands their citadel, with rude battlements, bastions and donjon-tower; there is their cathedral, where those two lofty splinters of basalt stand side-by-side, their front faces vertical, in the rear resting upon a buttress not unlike the body of a church; the round perforation in yonder black pinnacle was their clock, and through its open face you may see the sun rise. All has the semblance of massive masonry, the volcanic rock being checkered by rectangular lines of cleavage into ponderous blocks that are piled to dizzy heights.

And everywhere between the lava-dikes are the curiously eroded white buttes as far back as the eye reaches. Almost every imaginable architectural form and animal shape is represented, and for fifty miles this curious spectacle continues with endless variation. In one place was a perfectly square house with mansard roof and dormer windows, all of gigantic proportions.

The strata are horizontal, and through the easily disintegrated white sandstone, run thin discolored layers of more compact quality, which, succumbing to atmospheric influences less rapidly than the main mass, are left protruding to stud the honey-combed face of the bluff with shelves and brackets, or to lie like a long iron beam on marble columns, between which you might ride your horse; or are poised on wind-waisted pillars to serve as round tables for the Bad Land gods. Thousands of such capped columns and little tables, like big toad-stools, were disposed along the sides of the hills; while in the *coulees*, or ravines, colonnades and detached pedestals of partially cemented sand, capped by huge globes of light-brown color, as perfectly round as though turned upon a lathe, towered up to the height of a hundred feet or more. "One of the things we brag about," a pilot said to me, "is Citadel Rock." It is a vertical shaft of lava striking two hundred feet toward heaven upon a base forty feet square. Another is Steamboat Rock, which, from a certain point, has a striking resemblance to the outlines of a side-wheeler. Some of the hills were terraced into tiers of carefully shaped domes, capped by a single huge dome, surmounted, perhaps, by a miniature dead volcano, whose hard basaltic bit of a crater preserves the apex from wasting away. Sometimes these curious forms were isolated, a whole hill having been worn down to a single grotesque monument; elsewhere they would be clustered thick over the surface of some eminence, showing that there the water had been backward in its sculpture. It was as entertaining to try to make out the varying similitudes of the shapes the water-worn rocks had assumed to objects of art or living things, as they flitted by us, as to study the moving forms of the clouds on a summer afternoon. Near Pablois Rapids (Pablois was a wicked old French voyageur who made a business of stealing horses from the northern Indians, or anywhere else, and crossing them here) the edge of the crag ahead showed the mighty profile of an ancient Egyptian, just such a face as adorns the catacombs at Thebes. As we drifted nearer, this venerable personage slowly changed into the visage of a New York plug-ugly, with low forehead, bulging eye, undershot jaw and a mole on his nose. This faded out as we progressed, and there came to view the high forehead, sharp nose, sunken lips and double chin of an aged man full of solemnity. It was the foot of a mountain of leather-brown lava, rising 1,500 feet above the river, with ragged, desolate, crimson cliffs and slopes of loose debris. Creeping around it, the Benton ran her nose against the next white cliff—so deep was the water at the base—and allowed the current to swing her into the proper channel before she backed a little away, and then went on to where the white hills shut in the blue water at the next bend. After this came mountains of lava, fragments of fire-stained rock, with gloomy canyons between square buttes of black basalt. Owing to the yielding nature of the friable sandstones and soft marls composing these buttes, their sides are easily excavated, and the soil washed down into the hollows holds the water in a most tenacious mud, which crusts over as though firm. These treacherous quagmires make traveling through the Bad Lands almost impossible for animals, and occasioned the name *Mauvaises terres*, given by the early explorers.

#### For Forest and Stream and Rod and Gun. SPORT IN MINNESOTA.

DUCKS, GEESE, JACKSNIPES AND A RUSSIAN "BIRD-DOG."

FOR sportsmen visiting Minnesota in search of health, recreation or amusement, no part of the State offers better opportunities than the region traversed by the "Main Line of the First Division of the St. Paul and Pacific Railroad, with its extension in the Valley of the Red River of the North."

Leaving St. Paul and Minneapolis, this road runs in a north-westerly direction for 216 miles to Breckenridge at the confluence of the Red River and the Bois de Sioux, and thence nearly due north, parallel with the first mentioned water-course, for 120 miles more through the beautiful and fertile Red River valley, and will, doubtless, before the end of next year, be completed to the boundaries of Uncle Sam's possessions on the confines of Manitoba, connecting there with the railroad system of the British Dominion. This is in every respect a first-class road, running Pullman's sleeping and palace cars. The officers are courteous and attentive, and what to a sportsman is of great importance—the baggage-masters will take very good care of their dogs at trifling charges.

For the first seventy miles the road passes through a dense forest of hardwood, the "Grand Bois" of the French fur traders in ante-territorial times. Deer are here quite plenty, and ruffed grouse very abundant, and in the numerous lakes good pickerel, pike and black bass fishing is found. If you are a follower of good old Isaac Walton make your first stop at Wayzata, where the beautiful Lake Minnetonka, one of the finest in Minnesota, offers you unusual opportunities, and where the hotel accommodations are very good. Farther on through the woods a sportsman may find suitable quarters at almost any station, but Howard Lake, Kokato and Dassel are recommended.

At Darwin you get the first glimpse of the great North-western prairie. Groves scattered here and there between grain fields, lakes and stretches of native prairie, are at first

numerous; but, as you proceed westward, they gradually diminish in numbers and extent, until after passing Hermann, not a tree is in sight for forty miles.

In this beautiful country between Darwin and Hermann, the pinnated grouse (*Cupidonia cupido*) is found everywhere quite plenty, and in certain places there is excellent duck and geese shooting, notably in the neighborhood of Litchfield, Atwater (at the Kandigohi lakes), Willmar, Morris and Hermann. In all the places comfortable accommodations may be had at reasonable prices, and also teams to carry the sportsmen to the hunting grounds. At Hermann you bid good-bye to lake and grove and enter a sea of waving grass, the famous valley of the Red River of the North, destined in a future time—and not a far distant either—to be the great granary of America. On a single farm in this valley, where two years ago not a plow had touched the ground, was raised during the past year 185,000 bushels of wheat of the very best quality, and there are several other places already under cultivation, the extent of which would astonish an Eastern agriculturist.

Sojourning in this valley, the observant sportsman can hardly fail to notice some new features as well in the flora as the fauna of this region when compared with that of the more eastern part of Minnesota. Instead of the usual varieties of prairie grass you find the bunch or buffalo grass of the plains. The common deer has nearly disappeared and is supplanted by the elk, and farther north by the moose. The pinnated grouse is now scarce, but its sharp-tailed congener (*Pedioetes phasianellus*) becomes more and more numerous; and to those of my brother sportsmen who would wish to find this—the finest game bird of the grouse family—in multitudes in the Red River valley, I would say, come out next season and have for once a day of good sport. Do not delay until it is too late, for the Red River valley in its whole length and breadth will soon be transformed into a waving wheat field, and the *Phasianellus* like Leather stocking of old, does not love settlements, and will soon retire to the wild prairies and open spaces, where he is undisturbed by the presence of man. Among other changes in the animal kingdom may be mentioned that our well known little cotton-tail (*Lepus sylvaticus*) is seen here no more, and its place is occupied by its larger cousin, the jack-rabbit (*L. campestris*); the common Western brant (*Anser albifrons*), is supplanted by that most beautiful of the Anserine, the snow goose (*A. hyperboreus*), which here may be seen in flocks by the hundred, and the smaller curlew (*Numenius ludsonianus*), so common along the eastern part of the road, gives room to the sickle-bill (*Num. longirostris*). Doubtless there are many other changes, but the above have come within my own observation.

After leaving Hermann there is as yet, on a stretch of 150 miles, only three stopping places with fair hotel accommodations—Breckenridge, where there are good geese, duck, grouse and woodcock shooting; Glyndon, where this road intersects with the Northern Pacific, and Crookstown, near the present terminus. Around the two latter places the sharp-tailed grouse is found in great abundance, but, according to the game law at present in force, this fine game-bird, with the pinnated grouse, is in season only from August 15 to October 1.

Stopping for a few days in the beginning of October this year at Morris, a thriving young town on this line of railroad, I was invited by my friend, John Galvin, roadmaster on that part of the road, to join him and a few other friends in a day's goose and duck shooting at Hermann. Our party included Hon. J. McCarthy, of the St. Paul City Council; Messrs. Michael Galvin, R. Morris and the writer. By the westward bound train we arrived at Hermann after dark and were most kindly and hospitably entertained by Mr. Galvin and his amiable family, in whose company we spent a very pleasant evening. Before daybreak the next morning we were on our way to the hunting field, some three miles distant. For conveyance we used a hand-car which brought us in a short time to our destination, a stubble-field, where geese and brant were known to congregate for feeding. By the thoughtfulness of our host several pits, each large and deep enough to hold a man, had been dug here the previous day, and after putting out our decoys, we lost no time to occupy our hiding-places. The weather was mild, the sky cloudy, and hardly a breath of air stirring. At the break of day the birds commenced coming in. McCarthy had the first shot and brought down a fine Canada goose. Morris came next and got two brant in one shot; but after this—and it was now broad daylight—the birds flew very high, and, although the fusillade was quite lively, very few birds were bagged. After about two hours' stay in the pits we considered the morning hunt finished, and returned to the railroad and our hand-car, bringing with us five geese and two brant.

We were soon back to Hermann and to our friend's house, where an excellent breakfast was in waiting; and to this, with the true appetite of hunters, we did so ample justice that it was nearly 11 o'clock before we were ready for the day's duck-shooting. In the meantime our party had been increased by two young gentlemen from Morris, Messrs. Fisher and Brisbane, who now joined us in the intended expedition.

We started in two wagons for a group of lakes about three or four miles from the village. These lakes are all connected by a sluggish creek, and at the several inlets and outlets are excellent duck-passes. The place assigned to me by our captain was at one of these outlets of the creek into a large lake. On account of long-continued drought the water in the creek was low, and the banks covered with soft mud. Behind was a border of high bullrushes. In the edge of these I found an old boat, in which I and my Irish setter "Rover" made our headquarters. The place was a good one. I had a comfortable seat in the stern of the boat, and my dog a dry place at my feet, and we were both pretty well hid by the surrounding high weeds. Here we were now ready for the fray. Soon a teal-duck came along the pass at a rate a good deal faster than 2:40. I aimed fully two feet ahead, and down it came on the other side of the creek. This was a good beginning. Rover saw it fall, received his order to "fetch," swam the creek, brought it back handsomely, and resumed his seat in the boat. This was repeated several times. Some ducks I missed, others I bagged. All were of the same species—the blue-winged teal. Not another kind did I see.

I had been in this place quite a long while, probably a couple of hours, when Rover's nostrils commenced working. He rose to his feet, his tail stiffened, and he came to a most decided point where he stood in the boat. I was quite puzzled, but soon the explanation appeared. A jack-snipe, a genuine *Gallinago Wilsoni*, came out of a small patch of tussocks to my left, and was followed by others until there were four of them. They went on feeding on the mud-flat close by the boat, and within six feet from me and the dog. I put my left hand on Rover's head and whispered, "Down!" which was obeyed, his head remaining on the edge of the boat, and his glaring eyes following the birds' every movement with marked interest. It was a pretty sight. The little

fellows must have seen me, but did not seem to care, and went on with their business quite unconcernedly. They put their bills about half their length down in the soft mud, then raised them up and tried another place; then they ran the bills down until the mud reached their eyes, and brought up a worm or a grub, which they gobbled with great dexterity. Sometimes, when one of them had caught some big worm, which was not at once swallowed, the others would try to take it away, followed in pursuit by the whole party, just as you can see the chickens behave any day in the barnyard. This continued for quite a while. I remained perfectly still, very much interested and amused, while more than one duck, unobserved or disregarded, sailed over my head within reach of my gun. The fun I had looking at the performance on the mud-flat was more to me than shooting teal. At last, like a flash, they suddenly disappeared among the weeds. A shadow was reflected on the water. I looked up and beheld a hawk suspended in the air just above my little neighbor's feeding-ground. To get my gun to the shoulder and pull the trigger was the work of an instant, and I sent Mr. Hawk heels over head down in the creek. I was in a humor to defend those four snipe against all the hawks in Minnesota. But they did not show themselves a second time, and after a while I again commenced to pay attention to the ducks, and brought down a few more.

During all the time I had been sitting in the boat I had heard my friends diligently at work farther down the lakes, and, judging from the number of discharges of the guns, I supposed we must have a wagon-load of birds. It was rather late in the afternoon, and remembering a big lunch basket in one of the wagons, the contents of which I thought it time to examine, I left my place and joined my companions, whom I found scattered about on a stretch of more than a mile. They reported varied success, and complained that the birds had been flying rather high and "very fast." We had now luncheon and counted our game. There were eighty-two ducks of several varieties—mallards, French teal, broad-bills, widgeons, etc., of which my contribution was ten, all teal, to get which I had emptied twenty-one shells. We now wended our way back to Hermann and Mr. Galvin's hospitable house, where we arrived after sunset.

\* A RUSSIAN BIRD-DOG.

By the morning train, the day following, we returned to Morris. On board the train we met two of the crack shots of St. Paul, Messrs. Keogh and Bruno Beaupre. These gentlemen had spent two or three days at Hermann, and brought with them fourteen geese and brant and about 100 ducks, which, added to our new supply of birds, made the luggage-car look quite gamey.

There was also on the train another sportsman, a Mr. Sapier, who had been shooting farther up the road, at Breckenridge. Mr. Sapier had with him six hunting dogs, and among their number—lo! and behold!—there was a Russian setter. No mistake about it; it was the genuine article. At the first glance his very face brought memories back from other scenes and times long gone by. Mr. Sapier, to whom I sought an introduction, is by birth a Frenchman. He was a stranger in these parts, but seemed a gentleman of cultivation and intelligence, and was on his way South to continue his hunting expedition. In the course of conversation he informed me that he got the dog in question from a Mr. Keith (of the firm Keith & Milligan), of Chicago; that the dog had won a prize at the late trench show in said city, and that some parties in the State of Indiana, well known to Mr. Keith, kept a whole kennel of this breed of dogs, which properly ought to be called, not setters, but Russian bird-dogs, under which name, Mr. Sapier asserted, they were mentioned by several authorities, and by which title the dog now belonging to Mr. S. had won his prize in Chicago. Here, then, is a key to the solution of the question, so warmly discussed in the columns of the FOREST AND STREAM AND ROD AND GUN, whether any such breed of dogs as Russian setters (bird-dogs) is in existence. "All of which is respectfully submitted."

For Forest and Stream and Rod and Gun.

#### TROUT IN THE ROCKY MOUNTAINS.

DENVER, Colorado, Jan. 5, 1878.

EDITOR FOREST AND STREAM:

The eastern two-fifths of Colorado are plains or prairies. The western three-fifths is mountainous. In most of this larger portion the mountains are very rugged and lofty, but there are wide areas of plain, park and valley. Most of the mountain slopes, from 6,000 to 11,000 feet above the level of the sea, are covered with forests of evergreen timber. In the mountain portion of the State, five great rivers take their rise. The North and South Platte flow out to the north and east, uniting midway of the great plain, and joining the Missouri near Omaha. The Rio Grande del Norte speeds away to the south, traverses the territory of the United States for more than a thousand miles, then forms the boundary between the two republics nearly as much further, and falls into the Gulf of Mexico beneath tropical skies. The Gunnison and Grand plunge down to the west, where, with the Green, they form the great Colorado of the West, which enters the Pacific through the Gulf of California.

These five large rivers are made up from innumerable tributaries, great and small. Scores of them are so large as to be formidable in the season of floods. They in turn are formed by smaller tributaries, down to the tiniest brooklets, but nearly all find their beginning in the snow-banks and ice-fields that forever flock the sides and cover the elevated plateau of the high mountains. Such water as they carry is the chosen home of the brook trout, or, as they are more commonly called here, mountain trout. The first settlers of the country, who came hither eighteen or twenty years ago, found almost every stream swarming with these delicious fish, and the same streams contain them yet, but in many of those nearest to populous settlements they have been almost decimated. Farther away they are more plentiful, and in the distant wilderness there is plenty of water over which a fly has never yet been cast. There are some streams that contain no fish, owing generally to their being cut off by inaccessible waterfalls. Generally every lake, river, creek or brook in which a trout can swim has its finny denizens at some season of the year.

The Rocky Mountain trout differs from the brook trout of the Eastern States in color and markings. The spots are black, though in certain streams reddish spots are interspersed, and some are beautifully marked with carmine stripes and shading-away tints along the sides. There are, in all, five varieties—possibly more if nice distinctions are considered—differing in color, tint and quality of flesh, form, life and habit. They are said to be less gamey than the trout of the Northeastern States. I cannot speak knowingly upon that

point, as I never caught a trout east of the Rocky Mountain waters. I know that many of them are exceedingly lively, and will make a most gallant fight in summer, autumn, and into the winter, even when air and water are freezing cold.

The season does not begin until in July, after the great bulk of snow has melted and the rush of water is over. There are some streams that can be fished in May and June, but the above applies to all that are really worth visiting. The sport improves through August and September. After that it is uncertain. One day it may be excellent, and then for a number of days hardly a fish can be taken. In July they are in the small streams, but begin leaving them by the middle of the month, gradually working down until they reach the rivers before much ice forms. In former years great numbers were caught in the winter from some of the large streams, by cutting through the ice and fishing with bait, which they will then take ravenously. But protective laws and an improved public sentiment have almost put a stop to that kind of wanton butchery. There are many lakes scattered through the mountains that are plentifully stocked, and they are favorite winter quarters for the speckled beauties. Fishing in them is generally less lively sport than in the streams. The fish are less gamey as a rule. But they are favorite resorts for camping parties containing ladies or invalids, who are thereby enabled to fish from boats. In some of these lakes unusually large trout can be taken at certain times, the season for them often lasting but a few days. But then there is magnificent sport. Of such I may speak particularly hereafter.

In the early settlement of the country, fifteen or eighteen years ago, all the sport desired could be found within from fifteen to forty miles of Denver. My favorite stream was Bear Creek, which comes out of the mountains sixteen miles west of Denver, and joins the Platte six miles south of town. At the mouth of its canyon there were delightful camping-places in box-elder groves. There were no settlements near, and the sport was excellent any distance up the gorge, and for a mile or two out into the plain. The largest trout I ever caught there was eighteen and a half inches in length. A railway station now covers the ground where I landed him; a large summer hotel crowns the hill above, and a noisy village clusters around. They say there is fair fishing yet up the stream from ten to twenty miles, but the trout I have seen from there in recent years were small. I know too many better places to waste time catching minnows in Bear Creek. Ten miles south of Bear Creek the Platte leaves the mountains. Its canyon was inaccessible until recently, since which time fine sport has been reported. Further in the mountains it divides into a great number of streams, and in nearly all of them trout are abundant. A railway is now building through the canyon, and up along the river into South Park. Eight miles north of Bear Creek, Vasquez Fork leaves the mountains. Its north fork is so lined with quartz mills, which discharge their tailings into the stream, that the water is thick as slime. Of course trout no longer live there. In the south fork, well up toward its head and near the snowy range, there are yet a few fish. Eastern tourists with nothing to do, and invalid sojourners, think they find tolerable sport from Idaho up to Empire and Georgetown, and sometimes further up, but nobody else agrees with them in that opinion. Twenty miles north of Vasquez the Boulders come out—two of them where they enter the plains, but three a few miles in the mountains. All are yet fairly stocked, though nothing to what they were ten years ago. Twelve miles further north is the St. Vrain. Its upper waters are yet in the solitude of the unbroken wilderness, and there some splendid sport can be enjoyed. The greatest disadvantage is in the fact that nearly all its streams flow through dense forests, making them difficult of access and rough to fish. Sixteen miles north of the St. Vrain is Big Thompson, with better fishing-ground. From twenty to thirty miles in the mountains its course is through Estes Park, a meadow valley, in which the stream divides into numerous branches, all well stocked with trout. Here the Earl of Dunraven has bought a great tract of land, stocked it with cattle, built a hotel, and is creating a vast estate on the English plan. In earlier years this park, which lies close up under the shadow of Lang's Peak, was a great winter resort for elk. Herds of five hundred or more were not uncommon.

Sixteen miles north of the Thompson is Cache-la-Poudre River—the trout stream par excellence east of the snowy range in northern Colorado. It has nearly a hundred miles of fishing water, with much open valley easy of access, and many of our best sportsmen still go there, summer after summer, for a camping tour. Trout are still very abundant, and many of them are large. Toward the head of this river there are plenty of elk, deer, mountain sheep, bear, and a great variety of smaller game—animals and birds.

All these streams are parallel, flowing from west to east, and forming the South Platte River. All are accessible by rail close up to the foot of the mountains, from which a day's drive will carry the sportsman to the best of the fishing-grounds. The altitude ranges from five to ten thousand feet above the sea; oppressive heat is unknown; the nights are always too cool for insects, and there are very few to annoy at any time. Those few are horseflies that are sometimes troublesome in the first half or twenty days of July and then disappear, and mosquitoes that annoy for a few hours in some days, but sunset sends the last of them to roost. B.

## Fish Culture.

**STOCKING STATE WATERS WITH FISH.**—Editor *Forest and Stream*: I desire to state through your columns that the New York State Fish Commissioners are now ready to receive orders from parties desiring to stock any of the public waters in New York State suitable for brook trout or salmon trout. They will be delivered to any part of the State by the parties paying the traveling expenses of a messenger to deliver them and giving the names and localities of the lakes or streams they wish to stock. All orders must be sent to the undersigned before February 20.

Rochester, Jan. 17, 1878.

SETH GREEN.

**FISH FRY FROM MICHIGAN.**—The Fish Commission of Michigan request the publication of the following notice:

"The Fish Commission expect to be able to furnish for the inland waters of the State during the winter and spring the fry of whitefish, lake trout, and to a limited extent California salmon, brook trout, and possibly eels and grayling. Parties who desire to stock water, and who will become personally responsible for the plant, should address the Superintendent, George H. Jerome, Niles, Michigan, and particularly give the name of lake or stream, size and depth of water, and county

and township where located; and further, plainly write their name, post-office address and railroad station at which they will receive the fry. Persons complying with the above requirements will be seasonably notified by the Superintendent of the day and the train when the cans of fry will reach the station, and they must be on hand, without fail, to receive them when the train arrives."

**THE MINNESOTA STATE HATCHERY.**—St. Paul, Jan. 8.—The Willowbrook hatchery is all right, and salmon eggs placed upon our hatching troughs, numbering over 200,000, about 150,000 are turned loose in our ponds and are doing well. The grounds, general surroundings, and the buildings are, I think, a credit to us. We expect to introduce a number of different kinds of fish in the spring. WM. GOLCHER.

**SALMON BREEDING IN NORTH CAROLINA.**—I am pleased to inform you that according to reports given me by Mr. Wm. F. Page, the Superintendent of the North Carolina Hatchery, the success at Swanannoa Gap was even greater than hoped for. Two hundred and thirty-three thousand of the young California salmon were turned loose recently in the various streams of the State, as follows: Catawba, 50,000; Pigeon, 10,000; French Broad, 50,000; Linville, 12,000; Yadkin, 60,000; Broad, 25,000; and Cape Fear, 20,000. It would appear, therefore, that over ninety per cent. of the eggs packed at the Government hatchery on McCloud River, in California, and shipped to North Carolina, were developed.

WAGNER.

**CALIFORNIA FISHERIES.**—The Senate Committee on Fisheries and Game have lately been in consultation with Messrs. Throckmorton and Redding, the California Fish Commissioners. Messrs. Brown, Rogers and Logarda, representing the fishermen on the Sacramento River, were in attendance. The Commissioners asked that the law in regard to salmon fishing, as it now stands, should not be amended. Mr. Brown thought that the season was too long, and that one month of close season was plenty. That the fishermen were in debt because they could not fish long enough. He wanted to know why the fish were allowed to go down the river where the sea lions eat them? In evidence taken before the committee, the fact was disclosed that the Chinese fishermen never waste any fish. Big or little are all the same. Small fish, no larger than a lead pencil, are dried and sent to China. Where white men cannot find a living as fishermen, Chinese take their places. Of course, in any argument of this character, poor John Chinaman comes in for all the blame. The fact seems quite clear to us that the Mongolian does not do much more harm to the rivers than the Caucasian. We must side entirely with the Commissioners, and believe if the rules and regulations, as provided by them for the fishing of the California rivers, are changed in the least, that all their labors will be wasted. It resolves itself to this: "Catch all you can to-day, and whistle after the fish to-morrow." What with native fishermen, backed up by Italians, who take what the Americans leave, and Chinamen who fish with nets that knitting needles will hardly pass through, after a while there will be very few salmon in the California rivers.

**CARP CULTURE.**—In the *Petaluma* (Cal.) *Argus*, of a recent date, Mr. Levi Davis, the carp culturist of Forestville, Cal., gives the following estimate of the increase of these fish:

"A mathematical calculation on the subject might be of interest to those who contemplate this business. With these conclusions I submit the following, which is, in reality, a 'fish story,' and will probably be considered as such in the sense of exaggeration. In 1876, five carp (three females), two years old, raised 3,040 young, being an average of 608 to each female fish. This, however, is a very small estimate, and this year the same fish will exceed the number several fold. Taking this average, which will be a small one, after deaths, etc., are allowed, and trace the results for seven years, allowing one-half the young females, and allowing the young two years before spawning, and our results are almost beyond the limits of reason:

For instance, in 1866 the increase from three females was 2,040. In 1877 the increase the same. In 1878, 1,020 females increase 695,640, and so on; and the result of the seventh reaches the enormous sum of 81,695,234,240. The total of the seven years will be 82,645,177,480 or thereabouts. Average these at one pound each and we will have 41,324, 088.4 tons. Beyond this time the increase is so rapid as to seem too far beyond reason. And while these figures seem so far from possibility, those who are more familiar with the subject know that the spawning of a single fish, of some kinds, has been known to outnumber this total by far. These all go to show what can be done, and in consideration that carp, instead of consuming their young, care for them, show that the figures are not so far out of the way, and what could be done with proper facilities and care."

**FISH CULTURE IN COLORADO.**—We are much indebted to our special correspondent and agent, B. B. Porter, Esq., formerly of the Crystal Spring Trout Farm, in Bergen County, N. J., for the following report of the Fish Commissioner of Colorado for 1877:

STATE OF COLORADO,  
OFFICE OF THE FISH COMMISSIONER,  
BROOKVALE, NOV. 28, 1877.

To His Excellency John L. Kautz, Governor of the State of Colorado:

SIR: In compliance with the law I herewith submit the following report for your consideration:

I am in correspondence with parties in the Eastern States in regard to the food fishes deemed most suitable to the waters of this State, and hope to do with the very limited amount of funds placed at my disposal all that can be done the coming year by way of their introduction into the lakes and streams of Colorado.

I have adopted measures to have proper fish ways erected wherever I had a knowledge of the existence of artificial obstructions in the streams. I have also caused to be prosecuted and fined several parties for a refusal to comply with the law, and hope to have many obstructions removed from the streams by the coming summer, thereby giving to the fish free passage to the upper waters of the different streams.

Respectfully, WILSON E. SISTY, Fish Commissioner.

Commissioner Sisty's report will do very well for a beginning. It is business-like and concise. When he has any results to promulgate he will doubtless make them known at the proper time. As the report now stands it is the shortest on record. Mr. Porter, in a letter dated at Ogden, Utah, Jan. 12, says:

Mr. Sisty informed me that the brook trout of Colorado spawn every month in the year, but that the males were only ripe during the summer months. Mr. N. A. Baker, a practical fish culturist, who, by the way, has some very fine fish ponds near Denver, well stocked with the speckled beauties, says that he has taken spawn and hatched them in the months of May, June, and July, and is sure that that is the true spawning season for Colorado. Other parties who were well acquainted with the mountains and fish that are found in the different streams say that the trout spawn in the months of July, August, and September. Some one should make a thorough investigation to learn the proper time for the close season. From what I could learn the habits of trout are entirely different here from the same species in the Eastern and Northern States. Colorado must be a sort of sportsmen's paradise at the proper season. Good guides can be had for \$2.50 per day. Should any parties wish to make a pleasure trip to Colorado for sport or scientific research they should try and secure the services of S. W. Vance, of Denver, who is a practical taxidermist, and is capable of any scientific developments they may wish to make, as well as a first-class guide, being thoroughly acquainted with this part of the country. A letter would reach him through the care of J. F. Lower, Denver, Col. I was informed that Mr. E. Coster, Breckenridge, Summit Co., Col., has the finest collection of birds west of the Missouri River.

Yours truly,

B. B. PORTER.

## CAN EELS BE BRED IN OHIO?

JEFFERSON, O., Jan. 13, 1878.

EDITOR *FOREST AND STREAM*:

Feeling anxious to add to our sport, as well as our ladder, we are debating the question of stocking the tributaries of Lake Erie with eels. Within the last forty-five years there only two eels have been caught west of Virginia Falls—one at Erie, Pa., and the other at Cleveland, O., and speculation was rife as to how they got there, all finally concluding they came via the Canal. Grand River would be a perfect paradise for eels if we could procure them, and persuade them to stay with us. There are two mill ponds that run back for miles. The water clear generally is deep at one point—said to be sixty feet. To give you a idea of the water, it is only necessary to name our native fish—catfish, bullheads, muscalunge, pike, pickerel, black and rock bass, mullet and suckers, and several other kinds of lesser importance. It is argued here that the common eel is strictly a salt water fish, only visiting fresh water for breeding, and surely returns in the fall. If that is so we are on the wrong side of Niagara Falls to succeed in eel culture. "The sole object of the communication is to get light upon this subject."

SEPTUAGENARIAN.

We are only too glad to give our correspondent what light we can on the eel topic. In the year 1875 the Fish Commissioners placed some 36,000 young eels in Buffalo Creek, which stream empties into Lake Erie, above the falls of Niagara. No positive result can yet be deduced from the experiment. Eels are very difficult of transportation, dying in a few hours unless the water is changed. When eels are young and have to be carried any distance an assistant should accompany them. Eels may be procured in myriads in all the streams around New York, and almost anywhere near salt water. Until lately it was supposed that eels bred in salt water, probably in the fall of the year, but a series of careful experiments conducted by R. B. Roosevelt, Esq., President of the American Fish Culturist's Association, and one of our leading ichthyologists, inclines him to the conclusion that eels spawn in fresh water in the spring. As to the propagation of species in the eels, that is a hidden secret. Even the sex of the eel has not been well determined. Any one who will determine the two facts—as to sex and method of propagation—will make a distinguished name for himself in ichthyological science.

—There are now twenty-seven States whose Commissioners of Fisheries receive, hatch and distribute the eggs of fishes furnished by the United States Fish Commission.

## Natural History.

### HABITS OF THE RUFFED GROUSE.

NEW HAVEN, CONN., Jan. 1, 1878.

EDITOR *FOREST AND STREAM*:

Having been intimately acquainted with the ruffed grouse for several years, the frequent remarks concerning him in *FOREST AND STREAM* have naturally attracted my attention.

Lately, some of your correspondents have been much concerned about the disparity in the sex of these birds. Now, I don't believe that any one can determine by plumage, the sex of the grouse when under eight months of age, for then the ruff in both male and female is of the same size and color, and nearly as dark as in the old male. In examining a great number of specimens, I find that three and three-fifths of all the birds killed are young, so you can easily see where the mistake lies—all of the young of the year, besides the old males, have been counted as males. For the last five or six years I have noted the proportion of male, female and young of all the game birds that I have either killed myself or seen in the markets, and find that the numbers of males and females are very nearly the same.

In October and November the young grouse weigh from 16 to 22 ozs., while the old birds weigh from 24 to 25 ozs. Occasionally, you find an old grouse very much larger than the normal size, and weighing two pounds or over. Within the last two years three or four such birds have been brought to our taxidermists to be stuffed.

Several authors have noticed a larger proportion of the Eastern ruffed grouse with the red-plumage. I have hunted only in Connecticut, and in Eastern and Western New York, but can see no difference between the birds in this respect in these places, more of them being in the gray plumage whenever shot.

Only on two occasions have I been able to get a view of cock grouse drumming, and then not a very satisfactory one. On reading the notes of your correspondents who believed the bird to strike the log/rock or

ground with the tips of his outstretched wings, I was perfectly satisfied that the thing was settled, as my two stood perfectly erect, as described, while the opened wings were carried to the feet at every stroke apparently. But last week a correspondent states decidedly that the bird drums by striking the wings over the back; so again there is doubt in my mind, as these two birds certainly did bring the wings very nearly if not quite together over the back. Analogically considered, the ruffed grouse drums in the same manner as the barnyard cock beats his wings just before crowing. Last year an old cock grouse which I brought down with a shot through the head, commenced to drum irregularly as soon as he had touched the ground; but a nervous young dog which I was using, rushed in and retrieved it before it could be seen.

Have any of your correspondents noticed the fact that the ruffed grouse in the Western part of New York will almost always alight in a tree at the end of its flight. While in Connecticut it very seldom does so.

R. T. M.

[We quite agree with our correspondent that it is impossible to tell with certainty the sex of the ruffed grouse from the plumage alone. We do not hesitate to declare that if the statements as to the disparity of the sexes in birds killed during the season are based merely upon the appearance of the specimens, they are of little value. Dissection is the only safe method of determining this question, and we hope that our readers will bear this in mind, and next season will give us the benefit of their experience in the matter.—Ed.]

RUTLAND, VT., Jan. 1, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I have been much interested in reading the articles in your paper from your various correspondents concerning the "ruffed grouse." Up here in Vermont, where game is so scarce, we consider the "partridge" the prince of birds, and when I even hear the word spoken I have the same sensation that I imagine a terrier has when somebody says "rats." I know that you can appreciate that feeling, and will bear with me if I give you a little of my experience. I can add my testimony to that of your Ferrisburgh correspondent in your issue of Dec. 6th, as to the vitality of the partridge. I am not a good shot on the wing, but I always make it a rule when a bird rises anywhere in sight to blaze away, knowing that if I don't fire I won't kill anything. I have often been astonished at my success in finding my bird after it had flown away apparently unharmed. A few days since I was passing down a ravine along the course of one of our mountain streams when I saw a partridge sitting on a small spruce within easy range ahead of me. I dropped the bird, which immediately got up, ran a few steps and then went down the ravine out of my sight. I followed him so long as I thought there was any chance of finding him, but finally gave him up as a lost bird. Three days afterward I was hunting in the same locality, but followed the course of the stream up instead of down as before. When I had arrived within about one hundred rods of the place where I shot my bird I found him lying upon his back dead. He was fairly riddled with shot.

I spent nearly a month in the "North Woods" this fall, camping on "Big Wolf Pond," about eight miles from Big Tupper Lake. I shot a few partridges near our camp with my rifle. I remember one particularly tough one that I captured. The ball from my rifle (cal. 44) nearly cut his neck from his body, letting his head fall entirely over in front, yet the bird ran nearly twenty rods in my plain sight before he yielded, and then I believe it was only from loss of blood.

The grouse, although not remarkably plenty near our camp, were very tame, and I had the chance that I have often wished for to see them drum. Toward sundown one evening I heard a bird drumming near by, and I succeeded, by carefully creeping through the brush, in getting within a rod of him, and watched him repeat the call several times. I was so near the bird that I could not be mistaken in the evidence of my senses. The wings are raised slowly, about to a level, and then a quick downward motion is given increasing in rapidity. The wings do not hit any hollow log, or the bird's sides, or anything else. Of all the birds killed by our party only one was a hen.

S. E. BURNHAM.

## THE EUROPEAN STARLING.

EDITOR FOREST AND STREAM:

Some time ago, while an interesting discussion was going on in FOREST AND STREAM on the good and bad qualities of the English sparrow as a new citizen of our country, some one contributed to your columns an article on the European starling, highly commending him as having all the good points of the sparrow and none of his bad ones. Besides it stated, if I recollect rightly, that he is no mean songster. This article interested me very much, and I have since been thinking a good deal of the starling. Will you please post me on these points? Is he gregarious to such a degree that he will drive other birds from his bailiwick—for instance, our mocking-bird, the sweetest of all feathered songsters? If he is I want none of him, whatever may be his good points. Next, is he a first-class bug and worm-eater, and will he put himself to the trouble to hunt and scratch for them? Is he urban or suburban in his habits, or will he fly away and take to the unfrequented forests and fields? Will he survive a trip over the raging Atlantic, and, if so, what is the best season of the year to import him? Does he sing well, and will he assist in making our homes vocal with music? And, lastly, is he a pretty fellow to look upon?

My reason for asking these questions about the starling is this: We stand greatly in need, in this portion of Texas, of an industrious, indefatigable bug and worm-eater—one that will work well in winter. During the warm days of our winters our gardens swarm with wretched pests, inflicting severe damage on, and sometimes destroying, our cabbages, cauliflowers, etc. Indeed, they are worse in some winters than at any other season, for the reason that the bugs and other "varmin," whose peculiar food is the tender vegetation of spring and summer, being left still alive and kicking, and, compelled to have something to eat, pitch into our hardy winter crops, which are the only kind that we grow at this season. Thus, in addition to their own peculiar enemies, the cabbage tribe now have to contend with the peculiar enemies of the Cucurbitaceae and other hot season plants. The strip bug is now attacking my cabbages and cauliflowers in precisely the same way that it does the leaves of the melon, cucumber and squash in summer; and the cut-worm climbs up on the plants to eat the tender leaves. Butterflies, depositing villainous larvae, are now depositing on my grounds. We want something to help us fight these pests, and if the starling will make a good ally, and is not too objectionable on other grounds, I propose to join with others and import him. His kinsman—our common blackbird—is a good bug-eater, but he is too fond of damp grounds and forests, and will only stay around us in wet weather. As soon as it gets a little dry he bids us good-bye, to return no more till it rains. I believe that we have no other bird that devotes his attention particularly to our destructive bugs and worms.

As for the English sparrow, I am distrustful of him. I am satisfied that he is a good insect killer, but I dread his furious pugnacity. I have seen them in your New York parks gather together in knots and balls and fall to the ground, fighting one another like forty wild-cats. I believe, if you were to turn a mocking-bird loose in one of your parks

they would skin him alive in three seconds, and then tear him into mince meat.

N. A. T.

Houston, Texas, Dec. 27, 1877.

[Our correspondent asks us a good many questions, but we will try to give him such information as we have space for. The starling is said by British ornithologists to be not at all pugnacious. It is very sociable and mingles freely and amiably with flocks of other species of birds. The food of the starling consists chiefly of insects of various kinds, worms, snails and so on, with occasionally a little grain seed and fruit, much the same diet, in fact, as that of many of our blackbirds. Whether he will work hard after insects when he can get other food at a smaller expense of time and trouble we do not know, but presume not. If he will he is certainly very differently constituted from other birds and indeed from all animals. The starling dwells indifferently in town or country, and in many English cities is found in great numbers, breeding in church steeples, holes and crevices in walls, etc., etc. This species is said to sing rather nicely, although it is by no means celebrated for its powers in this line. It has been taught to speak, and, under favorable circumstances, is said to display considerable conversational powers. Lastly, he is a pretty fellow to look at, being shining glossy black in color, each feather tipped with a spot of cream color or brownish white.—Ed.]

## SQUIRRELS AND EMASCULATION.

JERSEY CITY HEIGHTS, Dec. 31, 1877.

I was much interested in the last number of FOREST AND STREAM AND ROD AND GUN in an article from Chas. Linden in regard to squirrels and emasculation. The theory he advances, giving as authority Prof. Grote, Director of the Buffalo Society of Natural Science, is, indeed, "a new thing under the sun" to me. That an insect is the entire cause of this very common operation on the *Sciuridae*, both the gray and black, for I believe it is an undisputed fact that they are identical—that this *Oestrus emasculator* deposits its egg on the testicles of the rodent, and that this egg, after developing into a larva, gradually destroys the organs and leaves no sign, seems to me most improbable.

Is it possible that this is a fact? I have often found this larva or grub, or something very similar, with its head deeply buried in the flesh of animals, more especially of hares and squirrels in the spring and early summer; but have generally found them about the neck of the animal, but never discovered them in any other place, as the animal, one would think, would make short work of these surgical individuals, could it readily get at them. I hope Prof. Grote or Mr. Fitch, of Albany (another authority C. L. quotes), will give us an article in your columns and throw some light on this (as it strikes me, rather daisy) theory.

Again, C. L. rather takes Mr. Fitch to task for being inclined to place reliance upon the many reports of trustworthy persons, who testify emphatically in regard to their personal observation of the red attacking his larger congener for the purpose of performing this operation. What country boy familiar with squirrels and squirrel hunting does not believe this, and scores can positively testify to this act of surgery, as witnessed by them performed by the chipmunk, the Ishmael of the rodent tribe, and pirate of the forest (for it is nothing else), upon their larger brother.

Now, I know whereof I speak, for my eyes have absolutely seen the thing done. In good old Madison County, New York State—and it was a good place for squirrels, I tell you—I remember well one day having taken my place on a log in a wood, waiting for the gentle dropping of a bud or nut, or the rustling of limb, to notify me, where the bushy tail was concealed. I was aroused by the shrill chi-chi-chi-ree-e-e-e of the *S. hudsonius*. I soon espied the impudent rascal cocked up on a limb, his tail on his back, reeling off his song like a first-class sewing machine. As the presence of one of these fellows in our hardwood forests is often a good guide to one of the larger kind, gray or black, I waited to see if this should prove an exception to the rule. Suddenly a branch rustled in another part of the tree, and I saw that a large gray was endeavoring to steal off to another neighborhood. With a sudden chirp-e, and a whisk of his tail, like a flash the red was after *migratorius*. The gray turned and made for the top of the tree, and had reached the very highest point when overtaken by its more nimble pursuer. Almost at the instant of the actual contact of the two animals, as it seemed to me, I fired, and both came tumbling to the ground. Upon examining them, to my astonishment I found the act of surgery on one of the testicles complete, and the sac of the other was slit as neatly as if done with a keen-edged knife. As a gelder, *S. hudsonius* was a most skillful success.

C. L. speaks of the large number of these animals found with their organs lacking, and showing no scar or ulceration. I have often noticed that fact myself, as well as found them with very perceptible scars, but I supposed the absence of the latter might have been owing to the act having been performed when the rodent was quite young, and that it had become grown over and obliterated.

This grub or larva theory, I must confess, is very interesting, and I hope it will be more fully ventilated by the scientists, or those that have more particularly studied the characteristics of these beautiful creatures. Why the reds do this thing, and why the gray, a so much larger and stronger animal, though by no means as nimble, should allow it to be done, is a scientific conundrum that I have never seen answered.

JACOB STAFF.

NEW YORK, Jan. 2, 1878.

EDITOR FOREST AND STREAM:

My attention was called to an article in your last issue entitled, "An Ill to which Squirrel Flesh is Heir." Are the causes to be ascribed to an insect?

Now, Mr. Editor, I will, if you please, relate a little of my experience which "fond memory brings to light." Some thirty years ago the Western part of New York State was largely covered with heavy timber, oak, beech, hickory and maple principally, and these woods were the favorite haunt of the black squirrel which were found there in great numbers in those days. There were also some gray and a good many red ones. It was the principal sport in the fall season among the farmers' sons to form parties of three and four and, accompanied by one or more dogs, to shoulder their light squirrel rifles. It was really grand sport; the dogs at times would have three or more up the same tree, and rarely one escaped, for the boys were good marksmen, as the heavy bugs at the end of the day's work proved. It was at these hunts that my attention was first called to the subject which forms the caption of this article. It was always customary after finishing up to divide the game as we were seated under some tree talking over the events of the day. While the game was being counted the singular appearance of some of the black squirrels caused us to examine the animals minutely and to debate as to the cause, for it was not found either in the gray or red. We appealed to older heads who had used the rifle for years and shot large numbers, both of black and gray, and there was only one opinion expressed; the red squirrel was the aggressor. It was a very common thing to see a black squirrel jumping from tree to tree in the greatest fear while his little red enemy was in close pursuit. I myself have shot a black squirrel

rel with the wound but partly healed, and so jagged that no insect could have had anything to do with it. Why is it the black is the only victim if it was an insect? I never saw a gray or red so afflicted, nor ever heard of it though they live in the same woods. I have shot a black and gray of the same tree. I have no doubt among the large circle of your readers it will awaken the same interest that it has in my case, and call forth the views of many who, like myself, have enjoyed many a day's sport with the squirrels.

CUTLER.

[The above communications are very interesting and correct one another on a number of points. We have just received from our correspondent—Dr. J. M. Smith, of Lafayette, Indiana, the following note which admirably supplements them.—Ed.]

The article on the castration of squirrels in a recent number of FOREST AND STREAM brought to my mind an incident that happened two years ago. My brother and I shot two full grown fox squirrels that were both castrated, and I shot a gray one last June, that was about two-thirds grown, in which the wound had not healed.

It is a common saying among the old woodmen in this country, that the old males castrate the young ones. I know one thing, and that is that there are no small red squirrels in this country, and no black ones to be found nearer than the Kankakee River.

[We would be very much pleased to hear from Prof. Grote on this subject, and hope that other friends will give us their experience. It seems to be a well established fact, however, that this *Oestrus (Cuterebra emasculator)* described by Fitch, does live in the scrotum of squirrels and destroys one or both testicles. A high authority says: "In some parts of the country it is often quite common, and doubtless greatly diminishes the number of squirrels."—Ed.]

A CURIOUS HYBRID.—The London *Sporting and Dramatic News* publishes a description of the hybrid, the offspring of an African zebra and an Abyssinian ass. The young animal resembles both parents, its color being grayish inclined to fawn, and its legs showing very clearly the zebra stripes.

A SAVAGE DEER.—The following dispatch to the Boston *Herald* shows how dangerous tame (?) deer sometimes are:

Newburyport, Mass., Dec. 20.—At Newbury, yesterday morning, Mr. John Little, an old gentleman 70 years of age, lying on Ocean avenue, found an American deer, belonging to W. C. Johnson, Esq., looking in at his window. He went to the door to drive him away, when the deer attacked him and knocked him down, breaking two of his ribs. Mr. Little then tried to frighten the deer away with an umbrella, but was unsuccessful. Finally a son of Mr. Little came to the rescue and shot the animal.

This peculiar ferocity is, however, believed to be confined to the males during the rutting season.

SWEDISH ARCTIC EXPEDITION.—The scientific expedition which is to sail from Gothenburg, Sweden, next July, for Arctic exploration, is to be fitted out with provisions for a three-years' cruise. The expedition is under the patronage of the King of Sweden, the Government, Oscar Dickson, of Gothenburg, and Mr. Sibiriakoff (a Russian). The route will be from Novaya Zemlya, along the coast of Siberia, through Behring Strait, thence they circumnavigate Asia, and return via the Suez Canal.

A CANADA MOOSE FOR THE PARIS EXPOSITION.—Canada is to send a magnificent specimen of the moose family to the Paris Exposition next summer. The animal when shot was in its prime, being about eight years old. Its dimensions were, from fore hoofs to neck, six feet; girth just behind fore legs, six feet six inches; length from tip of nose to tail, nine feet; pan of antler, two feet nine inches; spread of horns, four feet; bell, fifteen inches; length of head, two feet eight inches.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEB. N. Y. HORTICULTURAL SOCIETY.

### HOUSE PLANTS—[Continued.]

#### FLOWERING PLANTS.

IN a life-long experience we have seen many plants succeed well in one situation, or perhaps under peculiar conditions, that would fail under other treatment; but perhaps the greatest reason for failure in the cultivation of window plants is the choice of unsuitable varieties. Without stopping to think as to whether it is likely to succeed well or not in the dry atmosphere of the sitting-room, when we see a beautiful plant full of bloom or blossom buds we are very apt to buy it at once, and wonder at its so soon giving way and becoming unsightly. There are, however, many plants that will do tolerably well under what may be called "half-and-half" treatment, but which under generous care will be a source of pleasure to the cultivator, and these we propose to mention. This must be borne in mind, however, that very few plants will succeed if they are removed at once from the warm, moist atmosphere of the green-house to that of the parlor or sitting-room; they should be gradually inured to a dryer atmosphere, and they will not suffer. Plants forced into bloom in small pots have no constitution to stand such a strain on their vitality, and of those bought in early spring for window decoration, perhaps not one in ten survives. All plants taken from the open ground in September should be pruned back into shape in August to give the young growth a chance to start properly. They should be carefully potted, as before directed, and hardened off in the shade out of doors, removed to the house when there is any fear of frost, and on warm, sunny days should have plenty of fresh air. By this treatment early winter blossoms may be secured; whereas, if

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc.; that may be noticed, signs of suffering, etc.

### TREATMENT FOR HYDROPHOBIA.

WASHINGTON, D. C., Jan. 7, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Dear Sir—In your issue of Jan. 3 you are kind enough to call the attention of your readers to my letter regarding *Rabies canina*, but you mention that the advice I give is the treatment for hydrophobia. Allow me to correct you in this particular. What I suggest is not the treatment for hydrophobia, but for the prevention of this disease; for it is not every individual bitten by a rabid dog that has hydrophobia. I trust you will pardon me for venturing to insert here a paragraph from Sir Thomas Watson's admirable paper on hydrophobia, which seems to possess a special applicability to the case in point. After stating that this plague (hydrophobia) in his opinion, might be permanently abolished, he says: "The disease, or rather the pair of diseases to which I advert, consists of hydrophobia in the human species and rabies in the canine. *It is well to keep in mind the distinction between these two.* (Italics mine.) There would be no hydrophobia where there was no rabies; there can be no rabies unless it be communicated by a rabid animal. But they are not identical diseases. To use the concrete form of speech, rabies in the dog is quite different and distinct from hydrophobia in the man. The term hydrophobia is often erroneously applied to both diseases, but the rabid dog is never hydrophobic." I purposely call your attention forcibly to this matter of nomenclature, fearing that perhaps some one seeing my article and reading your kind paragraph approving of the treatment might insist upon cutting and cauterizing a sufferer from hydrophobia, which plan of treatment, good at the proper time, *i. e.*, immediately after the bite, would, in my opinion, only increase the nervous perturbation under which the patient suffered. When I wrote my article I had not read Sir Thomas Watson's lecture, and I am delighted to find how closely my opinions follow those of this distinguished teacher. Let me suggest that, as the public attention is now greatly excited over the subject of hydrophobia, that it might prove of interest to reproduce in your columns Dr. Coues' article on skunk rabies in one of the recent publications of the U. S. Gov't. Surv. of the Territories, the title of which is *Fur-Bearing Animals Miscel. pub. No. viii, 1877.*

Very truly yours,

H. C. YARROW.

### THREE HUNDRED DOLLARS DAMAGES.

WHAT IT COSTS TO KILL A GORDON SETTER—SANDFORD VS. ALLEN.

A CASE of great interest to owners of dogs was tried in the Monmouth County Circuit of the New Jersey Supreme Court some few days ago. Mr. E. S. Sandford, Jr., was the owner of a valuable Gordon setter, named Oberon, which had been placed in charge of Hart Haight to be broken. In July last the trainer, visiting a neighbor, accompanied by the dog, suddenly lost the dog. He was told that a man named Tom Allen, a farmer, had just shot a dog. On being questioned in regard to his (Allen's) shooting of a dog, he admitted to having fired his gun at a dog somewhat resembling Oberon. Haight, in making diligent inquiry for the dog and not finding him, went to a field, when he found marks in the stubble field where the earth had been lately dug up. On Haight removing the earth, there were indications that some animal had been first buried there and afterwards removed. A tuft of hair, black and tan, such as existed on Oberon's fore legs, was found, which confirmed Haight's suspicions. The tracks of men leading from where the dog had been buried to the river, seemed to indicate that the body had been thrown into the water. Mr. Sandford, represented by Hart Haight as bailee, in place of the owner, brought suit for \$500 damages against Allen. Gen. Haight and W. H. Vredenburg appeared for the plaintiff, and Robert Allen for the defendant. Prices of dogs were presented to the Court, Mr. Sandford testifying that large sums of money were paid for Gordon setters, and that Oberon was a favorable specimen of the race. Oberon's pedigree from the Duke of Gordon's kennel was produced.

Allen admitted that he had shot a dog and buried him. He alleged that his sheep had been worried by dogs two weeks before, and seeing a dog going in the direction of the sheep he had shot the dog. He admitted, however, that the dog he had killed was in a field adjoining the public road, and that a cornfield intervened between that field and the field where the sheep were.

The main points in Judge Scudder's charge were as follows: The case was one brought by the bailee in the place of the owner, and the charge made by Haight is that Allen shot the dog in the month of July and killed him. The plaintiff denied killing the dog Oberon. The Jury had to be satisfied that the dog killed was Oberon. A dog collar had been produced, but which was not the collar belonging to the dog which was killed. The question was did Allen kill the dog? By his own evidence it seems that Allen did kill a brownish dog—though he has said that it was a black dog which he had shot—and between the two statements there is a substantial agreement that the dog killed was black and tan. The plaintiff

would give no clue as to the dog to Haight. Allen misled and deluded Haight, which was evidence of a guilty mind. Why did not Haight frankly state that he had killed the dog?

The dog was then certainly on Allen's ground without any right. The dog was on another man's land, without invitation or permission. But every trespass of a domestic animal upon another man's land does not give him the right to kill it. If it is doing damage the law gives him a remedy against the owner, but he has no right to shoot a horse or a cow or a dog, or any valuable domestic animal, merely because it is trespassing upon his land. A man might be justified in killing a dog if it was on his premises destroying, or even chasing or worrying his animals. For instance, it is said that this defendant kept a large number of chickens. If this dog had been chasing or destroying his chickens he might have been justified in killing, and thus preventing it from doing any further damage of that kind. There is a special authority given by our State to kill dogs found trespassing, and that authority is given for the protection of sheep. Our statute enacts that "It shall be lawful for any person to kill any dog or bitch which may be found chasing, worrying or wounding any sheep or lamb." By another section the owner is made liable if he does not kill a dog that is found chasing or worrying or wounding them, after a notice of twenty-four hours. There is an express statutory right given to kill under certain circumstances. But there is no evidence in this case that this dog was worrying, chasing or wounding the defendant's sheep or his property. The defendant says that the dog was smelling about the ground, where the sheep had been some time before, and had gone twenty yards in the field where they were. But the dog was not in the same field; there was a cornfield between them. The dog was not worrying or chasing the sheep. The defendant did not even attempt to drive the dog off. According to his own evidence, he took a gun and shot the dog, merely because he was smelling the ground and looking in the direction of the sheep. This being so there can be no justification for the act under the statute. Perhaps a single call would have attracted the dog. He took the responsibility of going to his house, getting his gun. After snapping the first barrel, exploding the second one, he killed the dog. The further question is stated in this case, Whether an action is maintainable for killing a dog? I think it has been settled long since that such an action may be maintained. There may be value in a dog recognized by the law. A dog may have an intrinsic value for certain qualities which he possesses like any other domestic animal. He may be valuable to his owner as a watch dog; he may, as in this case, be valuable to the owner as a hunting dog; and when human skill and labor have been spent upon a dog, and expense has been incurred by the owner to develop any natural qualities which he may have and make him more useful for hunting, that dog has a value to his owner, who may recover damages. The question," the Judge now said, "was one of value—the worth of the dog in the market. Mr. Sandford had agreed to pay Haight \$50 to break the dog, and a part of this money had been disbursed. The dog's special value was for his breed; that he was a Gordon setter, not a mere fancy dog, but for intrinsic qualities. If the dog had special and distinctive qualities, these must be valued." Punitive damages, his Honor did not see, could be accorded. No malice was shown. The defendant did not know Haight. Perhaps the defendant might have thought he was exercising his rights in killing the dog. If the dog had been following his master on the road, and Allen had shot him, and wantonly killed him, there might have been in such a case evidence of malice.

After a short deliberation the jury awarded the plaintiff \$300 damages. We may remark that Judge Scudder's decision was a just one, and covered the case.

It was not necessary for the counsel for the plaintiff to prove malice, though evidence of a damaging character might have been brought against Allen which might have entitled the plaintiff to punitive damages. Mr. E. S. Sandford, Jr., brought on the suit, with no idea of using the law to its utmost extent, but simply to show a very ignorant and certainly brutal fellow that dogs are not to be shot with impunity.

### For Forest and Stream and Rod and Gun RUSSIAN SETTERS.

IN an article on this subject published in *FOREST AND STREAM* last August, I reiterated an opinion expressed in a previous communication that "there is no pure breed of setters peculiar to Russia."

This was in reply to a sharply criticising letter from "Canonicus," in which he asserted that "none but a novice or tyro could give public vent to such lamentable ignorance as the above sentence exhibits in canine knowledge," and "Canonicus" assures the sporting brotherhood that "the setter strain of Russia has been bred and kept strictly pure for the last century," but offers no evidence except quotations from "Frank Forester." Not accepting those quotations as proof of "Canonicus'" assertion, and that I might not again be accused of "lamentable ignorance" of canine matters, I expressed a desire for information on the subject from some one more competent to speak than myself. Since then, however, I have seen nothing on the subject from "Canonicus," nor from any—us, until quite recently. Referring to some letters on "The Dogs of Russia," written by Lieut. Ismailoff, of the Russian army, and published in the *Spirit of the Times*, the editor of *The Country* remarks that no mention is made of the so-called "Russian setter," and further adds, that in a personal interview Lieut. Ismailoff stated that "there was no breed of setters that he claimed as being purely Russian, and that the dogs known by that designation must have had as progenitors animals imported from Europe, successive generations of which had gradually been changed by climatic influences, until they had assumed the appearance of a different type." This sustains me in my original statement, and is evidence of value, coming as it does from a Russian gentleman, who is in a position to know much whereof he speaks. Lieut. Ismailoff ascribes to "climatic influences through successive generations" the cause of these dog appearing to be of a different type. Of course, if not of a distinct breed and entitled to

the transplanting is delayed too long, from their weak growth in winter, they are likely to be infested with all manner of insect pests, seldom blooming till February or March, and even then are good for little but to plant out of doors for next season's growth, for which they are not nearly so well suited as plants fresh from the green-house. Confining this notice to *winter blooming plants* it must necessarily be brief, and will be arranged in the order we have found them do best, and consequently give most satisfaction.

*Chinese Primroses.*—Time out of mind these lovely plants have been the loved of all, either for the conservatory or house. They can be raised from spring-sown seed, making large plants by fall. They are constant and free bloomers, are never infested with insects, and stand the dry heat of a living room as well as, if not better than, any plant we know of. There are many varieties offered in the seedsman's catalogue, but the fringed varieties, red and white, and the form-leaved varieties of the same colors are the best and strongest growers.

*Persian Cyclamens.*—Neater and more attractive plants than these it would be difficult to find, the colors varying from the deepest crimson to pure white; they are often very fragrant, and the flowers, which in a cool room will last in beauty over thirty days, look like a rabbit with its ears up. A lady whispers, "More like a shuttle-cock," and that she has had the one plant with over fifty flowers open besides buds on it at once for nearly three months.) This was in a cool room, however. The leaves are also often beautifully blotched and mottled. They are best planted out during summer in a shady border, and potted in September, or as soon as they show signs of starting into growth. Give all the light possible and do not over-water, especially at first.

*Ornithoglosses.*—Some of the varieties of this charming class are great favorites, blooming as they do all winter, and, owing to their drooping habit, they are often used for hanging baskets. The foliage is neat and clover-like, and some varieties are beautifully cut, and marked or splashed with brown. *O. floribunda*, both white and red, is seldom out of bloom summer or winter; *O. versicolor* (the barber's pole) is lovely in bud as well as when fully expanded; the yellow variety, *O. cernua*, is very fragrant and free-blooming; *O. bowei* is more of a fall species, but lasts well into winter. Its flowers are large, bright rose-colored, and it is altogether a splendid variety. *O. rosea* is also well worth growing for its neat habit and large rose-colored flowers.

*Richardia.*—The *Calla* or Egyptian lily is one of the most satisfactory, as well as beautiful, of house plants, and seems to have a special attraction for lady cultivators. Plenty of water and a rich soil, with an occasional watering with liquid manure, and the *Calla* will be a joy all winter and spring. Dry off during the summer, and, shaking off all the old soil, replant in September in a rich, rather open compost, giving water more freely as the plant gains in growth and strength. The variegated species, *R. alba maculata*, is only useful for late spring and summer cultivation.

*Azaleas.*—We have just seen to-day, Jan. 13, a plant of *A. phoenicea*, flowered by a lady in her sitting-room for three years, that is as perfect in leaf and blossom as if raised in a greenhouse by one of our most skillful florists. All the large-leaved, strong-growing varieties, no matter what color, or whether double or single, are good subjects for house culture. They should either be planted out or plunged in a shady border during summer, and carefully syringed occasionally with soapy water during hot weather to prevent the red spider getting a foothold.

*Abutilons.*—The various varieties of this lovely Chinese bell-flower are all good house plants, though the stronger growing varieties are perhaps too robust for ordinary cultivation. *A. striatum*, yellow, striped with red; *A. patersoni*, large, reddish crimson; *A. thompsoni* and *A. veitchianum variegatum*, with their beautifully blotched and mottled leaves. *A. boule de neige* is a very free blooming variety while still young, and *A. darwinii* and *A. darwinii fasciata*, never stops, are also very free bloomers, and will be sure to give satisfaction to all who try them.

*Cypripedium insigne.*—This most curious orchid, generally known as Chinese lady's slipper, is an excellent plant for the window garden. The soil should be coarse peat, loam and charcoal, with lots of drainage. It should have plenty of water while growing; will do well in a shady, northern exposure in summer, and if kept in a tolerably cool room, will flower from December to April.

(To be Continued.)

PLANT MANURE.—The following artificial manure is recommended for plant culture by M. Jeannel, of Paris:

|                               |           |
|-------------------------------|-----------|
| Nitrate of ammonia.....       | 400 parts |
| Biphosphate of ammonia.....   | 200 "     |
| Nitrate of potash.....        | 250 "     |
| Hydrochlorate of ammonia..... | 50 "      |
| Sulphate of lime.....         | 60 "      |
| Sulphate of iron.....         | 40 "      |
| Total.....                    | 1,000     |

M. Collardean reports, in the journal of the Horticultural Society of France, that he employed this manure with great advantage. He struck several cuttings of *Pelargonium* and *Fuchsia*, and placed them all under the same conditions, excepting that, while some were watered with the plain water, others received, once a week only, a watering with 50 grammes of a solution containing four parts in 1,000 of the saline mixture above detailed. The results are stated to have been very satisfactory.

—Paris has 100,000 trees, each of which costs about \$36. They live about fifteen years.

How to SAVE CORN FROM RATS.—Mr. Peter Zehnder for the past two years has sated a large portion of his corn in the shuck when he housed it, and none of it was eaten by rats, while that put up without salt was almost entirely destroyed. This is a simple remedy, and as the shucks when sated are greedily eaten by cattle and horses, it is certainly worth trying.—*Tusculum North Alabamian.*

CENTRAL N. Y. POULTRY SHOW.—The fourth annual exhibition of the Central New York Poultry Show will be held at the City Hall, Utica, Jan. 29 to Feb. 5.

A FINE SELECTION OF PURE-BRED FOWLS.—Mr. Leavitt, Whitesone Ave., four blocks from Bridge St. depot, Flushing, L. I. (only twenty minutes from Thirty-fourth St. ferry), has the finest selection (about 100) of pure Dublin imported bred fowls of twelve different varieties—Partridge-cochins, S. S. Hamburgs, Dutchess, Black Spanish, etc., etc. Price very low, \$1.50 to \$5 each. Call at residence, Flushing, or at 10 Pine St., Office of Gerard Ins. Co.—*Adv.*

classification as such, there can be no such thing as a typical Russian setter.

I do not deny the existence of the individuals to whom the term is applied, for I have not only seen them, but have shot over them. I do not ascribe their appearance to climatic influences, but to a direct cross, either near or remote, as the case may be, between setters and dogs of some other breed. It may have been a pure bred retrieving spaniel, or it may have been a mongrel. In short, the Russian sportsmen may have a fancy for uniformly crossing the setter with some special breed, or they may cross it indiscriminately with such dogs as are convenient. The "cross of a Russian setter" is common enough in this country, but I have never seen here a dog that was claimed to be a "thorough-bred Russian setter." If such a dog exists I should like to see its authenticated pedigree. My most recent experience with a Russian setter was with "Dolly," an American bred dog, whose grand sire was owned and imported by Alexander Bodiscoe, the Russian Minister to the United States for a term of years. "Dolly's" dam was a bitch of such fine field qualities that \$250 was offered for her by some gentlemen who shot over her with the owner. "Dolly" is a dull liver and white bitch, with a docked stern, and would hardly pass as even a half-bred setter. A peculiar mark that is transmitted to some of her progeny is the long hair on her head, which grows to a length of several inches, when allowed to, but which is usually kept clipped. She is certainly not pleasing to the eye, either in form or coat, and as she suspiciously approaches a stranger, with tucked tail, arched back and prominent ribs, appears like a veritable "nigger hound." But she has much usefulness, and if you can call her to you and look into the brown eyes that show so much intelligence, you will see that she is not entirely without beauty. Her master says that she is of the pot-hunters' breed, for no sportsman would care to have her at heel outside of the field, but in the field more birds can be bagged over her alone than over any or all of his dogs. She has no grace of motion, but is exceedingly busy, and has a very fine nose. Although not very thoroughly broken, she is very docile, and knows better where to hunt for game than the average sportsman. Now, let us take you into the field with her, kind reader, and if you are fond of partridge shooting, and there are any birds to be found, it will be no fault of hers if you do not have many shots. At the word, off she goes at a peculiar gait, that seems automatic, and one that she keeps all the day, to search the places at which she knows from experience the birds are most likely to be feeding. Soon we see her retrace her steps for a few yards along the side of a ditch, and come to a stand, the stern beating double quick time with short strokes. When we approach, she turns about, and, resuming her mechanical "lope," goes straight away down the side of the ditch, leaving you for a moment to think that she had deceived us by making game falsely. But no, not so; for she is only off in search of a place where she can cross the ditch without danger of flushing the birds. Soon she is seen coming back on the opposite side of the ditch, where you may be assured there is game. Sure enough she now draws up, gradually her stern stiffens, and we know where the birds lie. Do not try to force your way across the ditch here, for you have plenty of time to follow in "Dolly's" footsteps, and cross by a cattle path. This done, walk up, but don't shorten your breath by hurrying, for "Dolly" will wait for you, and flushing the birds, you may kill a brace.

"Sure, a bird must have fallen. Seek dead here, 'Dolly.'" Watch her now, as with nose to the ground she carefully tracks the running bird that is only wing-broken, and has a strong, sound pair of legs, until she reaches the ditch, into which she disappears, not in the least daunted by the matted mass of vines and briars, and from which she at last emerges with bleeding ears. Having bagged that bird, we will follow along the ditch and gather in more from the same scattered covey. Now, let us hunt the old wheat-field yonder that is bounded on one side by the forest primeval. "What is 'Dolly,' doing? Hunting hares?" Give her time and see. Down a furrow she goes with nose to the ground, crosses to the next furrow, and the next, pursuing a tortuous route toward the woods, evidently on the track of game. On she goes for nearly a hundred yards, and then stops with dropped stern, beating time. "There they are!" But no, for she turns about as if giving it up, and, making a detour around near the woods, comes back directly toward us, and stiffens on what we find to be a covey of partridges feeding in the woods. When "Dolly" found that the birds were running for cover and would not stop, she backed out, and, making a wide detour, headed them. This she will frequently do, yet rarely flushes a bird.

Alluding to "Dolly" and her get, her owner, whom I esteem as a personal friend and a thorough sportsman, writes: "The peculiarities of these dogs are houndish appetites, wonderful noses, staunchness, and great endurance. They will enter a briar patch without flinching, and are altogether the best and ugliest curs I have shot over after twenty-five years' experience."

Yet a thoroughbred setter or pointer will perform the same service, and at the same time please the eye by its handsome form, color, and carriage in action. And after the shooting season is over, those sportsmen who keep dogs not merely as servants alone, but as useful pets, would by far prefer a dog that shows high breeding to one of mongrel appearance, no matter how useful the latter might be.

"Stonehenge" has expressed no opinion as to the right of classification as a distinct breed of setters that may be possessed by what he terms "such poodle-looking brutes as the Russians," but to the description of the animals adds these remarks: "To some people, however, the bag is all important, and so that they can fill it they would use a mongrel or a turnspit." This lamentable fact is often illustrated by sportsmen whose only thought of the dogs when game is found is fear that they may flush before their masters are ready to shoot, and once the birds are up the dogs are lost to sight and memory until the excitement of the moment is over and their assistance is needed in retrieving the dead and wounded. Then, alas! too often will the dogs be seen racing at a distance, having broken at shot, and, crazy with excitement, flush other birds ere they can be recalled. This is demoralizing to both the dogs and their masters, the latter using forcible language not found in the catchism, and the former becoming less staunch with each succeeding occurrence of the kind. Eagerness to fill the bag is the most frequent cause of lack of attention to the dogs when in the field, yet the majority of sportsmen if once shooting over high bred, thoroughly broken dogs must needs acknowledge that there are accessories to sport that give a higher pleasure than can be rendered by a good "bag" alone.

Little has been written in regard to the so-called "Russian setter," except the formulated description without any allusion to its history. I do not believe that one can be found that has a just claim to be classified as a pure bred setter of a distinct breed.

AMICUS CANINUM.

**THE ST. BERNARD DOG—HIS DECLINE.**—The *Toronto Weekly Globe* is authority for a statement that the glory of the original St. Bernard dog has departed. A correspondent of the *Globe* writes, "that the dogs looked lazy and sadly in want of an occupation." Comparisons between the St. Bernards and the dogs of the Pyrenees were decidedly to the advantage of the latter. The deduction to be drawn from these quite possible statements is obvious. "Othello's occupation's gone!" Adventurous travelers no longer struggle through Alpine passes to be overwhelmed by snow storms. Railroads now burrow through the Alps, and the horrors of the Simplon, of St. Gothard, and of Mount St. Bernard no longer exist. Hence there is no use for these noble dogs. It is likely that in time to come, on the English bench shows the only St. Bernards may be seen. It is worth recording that on the Himalayan mountains there exists a race of noble Tibetan dogs, which are to-day the rivals, not the superiors, of the St. Bernards. May be the early Aryan races in their migrations brought with them the progenitors of this famous St. Bernard. It may be well to recall the fact that it was Albert Smith who first, in England, made the noble St. Bernard a favorite animal.

**ST. LOUIS BENCH SHOW.**—We are in receipt of the Premium Lists and Entry Blanks of the St. Louis Bench Show, which may be had at the office of THE FOREST AND STREAM AND ROD AND GUN on application. The following corrections and omissions in the Prize List are brought to our notice:

CLASS 71—Should read, after value \$20: "Also a handsome Shooting Suit, donated by Brown & Hilder, Gun Dealers, St. Louis, value \$25—which will make the prizes in this class amount to \$45 value."

CLASS 92—Should read: "For the best pair, dog and bitch, of Irish Setters, imported or native, owned by exhibitor."

CLASS 93—Should be added, as follows: For the best English Retriever, dog or bitch, wavy or curly coated, a handsome plated revolver, presented by Brown & Hilder, Gun Dealers, St. Louis, value \$25.

### ABOUT JUDGING AT THE ST. LOUIS BENCH SHOW.

EDITOR FOREST AND STREAM:

I see by your last issue that the judges have been appointed for the St. Louis Bench Show, and exhibitors are to be congratulated on the selection. Handsome prizes are offered for native English setters, from which the "blue bloods" are excluded. This will, doubtless, bring to St. Louis many of our best natives, who will compete with the blue for the special and open prizes. Now, the respective merits of the two have been widely and fiercely canvassed, and many have objected to the decision given against Mr. Morford in New York by the judges selected by Mr. Smith.

So, as the St. Louis managers are anxious that everything shall be conducted in a satisfactory manner to all, I suggest that in the classes where the native and imported dogs are competing for the same prize, that the class be judged by the three judges selected for the different classes, and not by the same one who decided against the natives at New York, whose opinion we already know. In case such a course should be adopted, I am sure there would be a much larger Eastern representation, and the awards much more appreciated.

Respectfully,

FAIR PLAX.

**DOGS FOR ST. LOUIS.**—The Baltimore Kennel Club have chartered a special car from Baltimore to St. Louis and return, to take the dogs which will be sent from Baltimore to the St. Louis Show Feb. 19, to last four days. Some of the finest animals in Maryland will be entered.

**THE BALTIMORE KENNEL CLUB.**—The Baltimore Kennel Club, at a recent meeting, voted to give the St. Louis Bench Show their hearty co-operation, and to use all their influence to induce dog owners in Baltimore and Washington to send on their best animals to St. Louis.

**FIRST ANNUAL BENCH SHOW OF THE MASSACHUSETTS KENNEL CLUB.**—This exhibition will take place in Boston at the building in Central Court formerly occupied as the Aquarial Gardens, on Tuesday, Wednesday, Thursday and Friday, March 26, 27, 28 and 29. The entry fees will be \$3, and will be received until noon on March 13, except in case of foreign exhibitors, who will be allowed until March 18. All cash premiums payable in gold coin. The officers of the association are: W. H. Cowing, President; Messrs. J. Fottler, Jr., and E. L. Dorr, Vice-Presidents; T. T. Sawyer, Jr., Treasurer; E. J. Forster, Secretary. Exhibition Committee—Messrs. F. B. Greenough, J. Nelson Borland, T. T. Sawyer, Jr., Luther Adams, Samuel W. Rodman, James F. Curtis, and John Fottler, Jr.

**MEADVILLE DOG, POULTRY, PIGEON AND PET STOCK ASSOCIATION.**—This exhibition will take place January 28th to 31st, inclusive, and not 25th to 29th. Entries will close January 26th. The society has assurances from home and abroad that warrant the supposition that their show will be a remarkably good one.

**POINTS OF THE ITALIAN GREYHOUND.**—The *London Field* gives the following points in judging the Italian greyhound:

|                    |    |                    |    |               |    |
|--------------------|----|--------------------|----|---------------|----|
| Head.....          | 5  | Fore quarters..... | 10 | Color.....    | 15 |
| Neck.....          | 5  | Hind quarters..... | 10 | Symmetry..... | 15 |
| Ears and Eyes..... | 5  | Tail.....          | 5  | Size.....     | 15 |
| Legs and Feet..... | 10 | Coat.....          | 5  |               |    |
|                    | 25 |                    | 50 |               | 45 |

The weight differs with the sexes. The bitch for modern successful exhibition should be a little over 5 lbs., nor should the dog exceed 7 to 7½ lbs. The original dog, as imported from Italy, will weigh 10 to 13 lbs., and are classed as "whip pets."

**DOGS TO POINT DEER.**—A correspondent asks us if there is any variety of dogs which will point deer as setters do birds, so that the necessity of running the deer with hounds may be avoided, as well as that the sportsman may be notified of the near presence of game which he would otherwise be ignorant of. We have read of something of the sort, and believe that there is a breed of dogs in France known as "limiers" which stand on deer or may be trained to do so. We have extended our inquiries on this subject to both sides of the water, and shall hope soon to obtain light. From Capt. John M. Taylor, of Virginia, we have the following very sensible deductions based upon his intelligent observation, and we hope others of our readers will test the question, as far as they are able, whether this method of hunting be practicable, supposing that the dogs can be properly broken.

BELLEFONTE, Nottoway County, Va., Jan. 10, 1875.

MR. HALLOCK:

About dogs trained to point deer. As I live in a grand deer country where I see this animal almost every day, I have come to the conclusion that the deer has as good a nose as the dog. Its wonderful sense of smell is astonishing. Deer, or animals of any kind, will not lie to a dog. They are directly antagonistic. In the bird it is different, as they most assuredly feel the presence of the dog, and are apparently not alarmed. Again, the quick and sensitive hearing of the deer would, in my opinion, destroy all chance of the dog pointing or informing the sportsman of its whereabouts. I am aware that deer are sometimes (not frequently) jumped out of their beds, but that depends wholly, I think, on the wind. For a dog or man to approach a deer with the wind blowing on the animal in the open or in cover in the fall, haying salt licks within shooting distance, is next to an impossibility. The noise that the dog would make ranging about, breaking twigs, etc., would be of itself quite sufficient to alarm any animal. However, it is possible to break a dog to do almost anything, so I presume there are some dogs in France, as you say, or elsewhere, which are trained for that purpose, but I never heard of them.

### SPARROW DOGS.

EDITOR FOREST AND STREAM:

I see with great regret that at the numerous dog shows throughout the country no mention is made of a class of dogs that will soon be necessary, and that is—a breed of sparrow dogs.

Judging from my experience this season of the scarcity of game, and the efforts of such men as our friend South, in snipe time, together with the new hammerless 100 yards gun, etc., there no doubt is, or soon will be, a good chance for the breeders to dispose of a large number of sparrow dogs. Sparrows are, as yet, numerous, and, with proper protection, will afford sport for some years. Our children will, undoubtedly, have fine shooting in that line, and over their evening pipe discuss the legends of extinct birds, called ruffed grouse, quail, etc. And if they come across some rare old copy of *FOREST AND STREAM*, giving accounts of our shooting, put it down as a—well, a highly improbable story, to call it by no worse name. I throw out this hint to dog breakers without charge, and hope they will profit by it.

W. HOLBERTON.

**HOW LADIES SHOULD DRESS IN THE HUNTING FIELD.**—With regard to ladies riding regularly to hounds, it must now be considered an established fact that the presence of a considerable number of good sportswomen is always to be looked for with every first-rate pack. As a guide to those of the fair sex who may intend to join in this favorite amusement, the costume of the hard-riding huntress of the present day consists of a short, closely-fitting habit of blue cloth of different shades, or, of light gray, with collars and facings corresponding with the uniform of the hunt, when it is of a distinctive character, such as the Beaufort or the Pychley. A tall hat, well curled at the brims; a white neckcloth, with neat gold pin; stand-up collar; and last, not least, high boots of varnished leather and a hunting crop, with, of course, a drab Ulster of many capes, to wear when driving to cover in a dark-green or oak-colored dog-cart, drawn by a very clever stepper, with the nattiest of grooms alongside; or, if preferred, a tandem or team of first-class nags. It is essential that ladies, in the latter case, should take lessons, so that they may be able to handle the ribbons in proper form when they come into the Shires to exhibit their perfections, as they will find many first-class performers already in the field.—*London Telegraph*.

**FOX HUNTING IN VIRGINIA.**—The Lynchburg, Va., *New* expresses the opinion that there are in Virginia ten well broke and well bred hounds and hunters for every one in England.

—Two young men of Newburg, N. Y., went gunning the other day, taking with them a fine pointer dog. As they went through the woods they bent over a sapling, to which they attached a snare and a piece of meat for bait, in hope of finding some game caught therein when they came back. Presently they missed their dog. Whistling and calling were of no avail, and so they tramped back to look for him. They finally found him in the snare, dangling several feet from the ground and almost dead from the choking. At a favorable moment he had left his masters and gone back for the meat.

**QUEEN AND HER PROGENY.**—My pointer bitch Queen has whelped eight pups—four dogs and four bitches (Jan. 14)—and they are as fine pups as you ever saw. They are three days old. I have disposed of all the dogs.

N. R. BAKER, Topeka, Kansas.

**NOTES FROM DETROIT.**—J. N. Dodge, of this city, received per express on the 15th inst. the stud basket or foot beagle dog Ringwood. He is white with black-and-tan spots, and is a perfect little beauty. Mr. Dodge's imported beagle bitch Dolly was visited on the 18th inst. by stud dog Italy, property of Gen. Rowett, Carlingville, Ill.

RED KUTUS.

—The champion and first prize bitch, owned by A. C. Wadden, now by the Kansas City Kennel, has whelped 8 pups—7 bitches and 1 dog, by St. Louis Kennel dog Sleaford. They are very fine.

KANS. CITY KENNEL.

**VISITS.**—B. A. Shapley's (Utica, N. Y.) field trial setter Bess, out of D. O. Bergundthal's Fanny, by his Rake, to Arnold Burges' Rob Roy.

# THE COUNTRY,

A weekly journal of sixteen pages, devoted to the Kennel, Shooting, Fishing, Fox Hunting, Archery, and other outdoor sports. Has also departments treating of Natural History, The Garden and Poultry, Pigeons and Pets. Edited by Wm. M. Tilden, late associate editor of FOREST AND STREAM. Subscription price, \$3 per year. Send stamp for specimen copy. Address, "THE COUNTRY PUBLISHING ASS'N," 33 Murray street, New York. —[Ado.]

## The Game of Chess.

Notice.—Chess exchanges, communications and solutions should be addressed "Chess Editor FOREST AND STREAM, P. O. box 54, Wolcottville, Conn."

### Problem No. 2.

Tourney set. No. 1. Motto.—Earnestly Advise Knowledge.

White to play and mate in three moves.

### Game No. 2.—BISHOP'S GAMBIT.

### THE FOREST AND STREAM PROBLEM TOURNEY.

Recognizing the increasing favor with which this branch of the roya game is regarded we have decided to offer a number of liberal prizes for competition.

### THE PRIZES.

|   |         |
|---|---------|
| 1. For the best set.                            | \$25 00 |
| 2. For the second best set.                     | 20 00   |
| 3. For the third best set.                      | 10 00   |
| 4. For the best three move problems.            | 5 00    |
| 5. For the best five move problems.             | 5 00    |
| 6. For the second best three move problems.     | 2 00    |
| 7. For the second best five move problems.      | 2 00    |
| 8. For the best problem entered in the tourney. | 5 00    |

Each composer is invited to send in a two move problem accompanied by his photograph, the author of the winning position to receive as a prize all the photographs.

Problems will be judged according to the following standard.

### BULL'S PROBLEM CODE.

|   |                 |
|---|-----------------|
| 1. Beauty and originality of design.      | 1 to 10 points. |
| 2. Difficulty of solution.                | 1 to 10 "       |
| 3. Accuracy and elegance of construction. | 1 to 10 "       |

### RULES.

Competition is open to the world. All problems to be direct mates—that is to say, white to play and mate in two or three moves, as the case may be. All problems must be original and not hitherto published. Competitors may enter as many sets, or single problems as they please. Each competitor will affix a motto to every single set or problem sent in and also inclose his name and address. Competing problems will be submitted to the umpire, Charles A. Gilberg, Esq., who will report all unsound positions. American composers will be allowed four weeks in which to correct such positions; foreign composers being allowed eight weeks for the same purpose. Should the requisite corrections not be received within the time specified the positions will then be ruled out of the tourney. The tourney will be open to competition until the first day of July 1878, after which date the list will be closed. The prizes will be awarded within two weeks after the publication of the last problem. Address E. A. Kunkel, Wolcottville, Conn.

### THE FOREST AND STREAM SOLVERS' TOURNEY.

This tourney commences with problem No. 1 and will continue until all the problems entered in the above problem tourney are published.

### THE PRIZES.

|  |         |
|--|---------|
| 1. Cash prize of.                      | \$10 00 |
| 2. The FOREST AND STREAM for one year. | 5 00    |
| 3. Cash prize of.                      | 3 00    |
| 4. " " "                               | 2 00    |
| 5. " " "                               | 2 00    |

### CURSORY JOTTINGS.

—The games in the International Tourney are already well advanced and, judging from the games published, the contestants are generally playing extremely well, and with great care. The pairing of the several participants shows very good judgment on the part of the managers of this tourney, notwithstanding a few critics demur to Mrs. Gilbert, the "Queen of Chess," being opposed to Mr. Gossip, a prominent English player. These aggressions are unequalled for, unkind and unjust to that lady, and these critics ought not to persistently ignore her record containing important match games won by as brilliant and sound combinations as correspondence play has yet spread upon the record, from players not inferior to Mr. Gossip in chess strategy.

—Mr. Gossip's "Theory of the Chess Openings," it is announced, will soon be ready for delivery to subscribers.

—Ajeeb, the wonderful automatic chess player, is quartered at Hartman's Hotel, in the Bowery. Our German exchanges, particularly the *Schaech Zeitung*, pronounce it quite a curiosity, and to all appearances, an ingenious invention.

—The American Chess Journal has passed into the hands of Messrs. Loyd & Moore, two of America's leading problemists, and will be issued hereafter from New York. We do not doubt but what they will make this chess monthly the equal of any now published.

—The Hartford "Chess Circle," one of the largest and most influential chess organizations in America, recently engaged in the first telephone chess game on record.

—Mr. Babson, formerly Chess Editor of the Boston *Globe*, recently announced in a blindfold game, wherein he stipulated to compel a self, mate with his opponents K. B. P., an extraordinary mate in thirty-three moves.

—The grand consultation match at the Cafe International is still pending. Mr. MacKenzie and his associates have the advantage, having won two games.

—Mr. J. A. Miles, Fakenham, Norfolk, Eng., is preparing a new edition, greatly enlarged and entirely re-arranged, of his "Chess Gems." The subscription price is fixed at 12s. 6d. per copy.

—Mr. F. M. Teed, umpire of our first tourney, does not consider a supplemental award necessary, and we, therefore, follow the original award, whatever may be said to the contrary notwithstanding.

—The chess editor of the St. Louis *Globe-Democrat* gives the FOREST AND STREAM chess column, etc., quite a notice. Thanks, Bro. Foster, Hallock, the late editor and publisher of the American Chess Journal, says in his new chess column in the *Hannibal Herald*: "We are pleased to learn that a chess department is to be introduced into the columns of that excellent journal the FOREST AND STREAM of New York, etc." We return the compliment: Hallock's new chess column fills two entire columns and is in capable hands. Mr. Peiter's notice in the Hartford *Globe* of the FOREST AND STREAM as "one of the most popular and respectable sporting papers," and friendly compliments paid ourselves, is appreciated.

## Game Bag and Gun.

### GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

### FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oystercatcher, surf birds, phalaropes, avocet, etc., coming under the group *Limicola*, or Shore Birds.

MASSACHUSETTS.—New Bedford, Jan. 19.—A flock of wild geese flew over this week, bound northward, from which one was shot. Sea fowl are plenty. CONCHA.

NEW YORK.—Shelter Island, Jan. 16.—The coot shooting, with battery, has been remarkably good in these waters this fall and winter, and I have enjoyed some sport. ISAAC.

NEW YORK.—Hornellsville, Jan. 14.—The shooting season just closed has been very fair, but I did not hear of a single quail being shot. John Penwell is champion hunter, having killed 118 grouse since Sept. 1; the last day he bagged 13. JOHN.

BUFFALO GUN CLUB.—At the annual meeting, held Jan. 8, the following officers were elected: J. E. Pierce, Pres.; T. H. Clough, Vice-Pres.; C. G. Strong, Sec.; Richard Edge, Treas. Board of Managers—O. C. Pickering, W. W. Ransom and W. H. Price. J. G. G.

SOUTH CAROLINA.—Charleston, Jan. 17.—During the last few days of fine weather, several fine bags of partridges have been brought in. On Monday a few of our hunting club, after a capital day's sport, brought home a fine buck; they report turkey very plentiful, but difficult to get at. There was a large and exciting fox-chase near Beaufort a few days since, and a few ladies joined in the sport. I trust that this good example set by the Beaufort ladies will be followed by all of our fair friends who have the opportunity of indulging in this fascinating sport, and I have no doubt that after a few rushing, ringing runs with the hounds, they will enjoy fully as much as we do the sweet music of a good pack, and feel that glorious, intense excitement as reynard on his last run bursts into view, closely followed by hound and horse. YENOTS.

—James Mitchell, Fred Bivins, Johnnie Woodward, of Butler, Ga., went out squirrel-hunting the other day. Mr. Mitchell got into a rattlesnake's retreat and was bitten four times before he could extricate himself. There was a flask of brandy in the party, and after drinking the contents felt no inconvenience from the bites. Mr. Woodward, while attempting to shoot the snake, accidentally shot Mr. Bivins in the left arm just below the elbow. The snake was killed, and measured fifteen feet in length, with twenty-one rattles and a button.

TENNESSEE.—Savannah, Jan. 14.—Ducks and geese arriving in large numbers. Quail are getting scarce; turkeys and squirrels still plentiful. One gunner came in from a short hunt last week, with one turkey and seventeen squirrels. Owing to the extremely wet weather, we have heard of no large bags of wild fowl; there is too much water to the duck. However, I have killed several ducks in the cornfields while out shooting quail. WILL.

Huntingdon, Carroll Co., Jan. 18.—Yesterday the match quail hunt between Capt. S. W. Hawkins and Ernest Hawkins on one side, and Attorney-General Rice A. Pierce and T. A. Douglass on the other side, came off in this county, the first-mentioned parties hunting with two pointers (Tom and Bruce), and a boy to mark and pack, and the other side with one pointer dog and a boy to mark and pack. Result: Hawkins

nd Hawkins, 66 quail and 3 rabbits; Pierce and Douglass, 93 quail and 8 rabbits. Can any backwoods sportsmen give a report of heavier bags? Capt. S. W. Hawkins used a twelve-gauge Parker breech-loader. The other used muzzle-loaders. NIMROD.

FLORIDA.—Lake City, Jan. 14.—The many lakes in the vicinity are frequented by thousands of ducks. Partridges are plenty in the old fields and the pine woods. T. B. R.

TEXAS.—Fort Clark, Jan. 10.—This post is 125 miles south of San Antonio. The bears, deer, turkeys, geese, ducks, quail, snipe, and brant make this a grand place for a hunter, and if the wily Apache would only let us enjoy it instead of hunting him all the time we would get more sport and more game. I saw a wagon load of turkeys sold last week at fifty cents each, all of which—twenty-six in number—were killed by one man with a shot gun in one night. We have some good dogs and good shots among our officers. Major McLaughlin, Tenth Cavalry, killed forty-nine quail with sixty shells one day last week. Lieut. Van Vliet, Tenth Infantry; Major Bliss, Twenty-fifth Infantry, and Dr. Shannon, U. S. A., are all crack shots, who seldom kill less than twenty-five to thirty in a half day's shooting—all wing shooting, of course. BUSHWACKER.

MISSISSIPPI.—Corinth, Jan. 22.—Sacked fourteen quails and one hare yesterday, in three hours, over Kate and Belle. Weather gorgeous, bright and bracing. Guido bagged sixty-nine quails yesterday and part of the day before, at Grand Junction, thirty miles west of this place. D. and Dr. P. sacked twenty-four quails and a hare or two on their way home, after hunting turkeys, Tuesday afternoon. GUYON.

TROUBLE FOR SPORTSMEN.—We cheerfully do our part toward giving to the subjoined warning a wider publicity than even the most sanguine of its authors could have expected:

Dunkirk, Harding Co., Ohio, Dec. 10, 1877.—Naber Hill, you have sum yorkees Boarding with you that are trespassing on our Premises & if you Hunt Hunting ground Anuff of your own you Had Better take sum of that Loos change you speak of so often & By sum or ship them to sum other Point for we Have no youse for them Hire & if We are Botherd with them any More you May expect your friends will get in trubel for we mean Bizness.

David Harigle, Samuel Taylor, T. Sullivan, B. Cotner, Jacob Younglove.

IOWA.—Algona, Jan. 8.—Mr. J. G. Smith, the agent of the United States Express Company at Algona, Iowa, is something of a naturalist as well as a sportsman. He has the finest collection of birds in Iowa, and during the past ten years killed more than twelve hundred wild geese, to say nothing of other kinds of game.

MICHIGAN.—Rabbit hunting is now a popular sport. Many of our sportsmen report good bags. KEN RUFUS.

MARKET SHOOTING IN MASSACHUSETTS.—This is the record of the work of two pot-hunters the past season, as recorded in the Worcester *Evening Gazette*, of the 18th inst. Messrs. Geo. and John Stone follow shooting as a business and send their birds to New York:

|                | Partridge. | Woodcock |
|----------------|------------|----------|
| September..... | 339        | 41       |
| October.....   | 273        | 66       |
| November.....  | 197        | 14       |
| December.....  | 140        | 0        |
| Total.....     | 1,068      | 121      |

Besides these 1,189 birds sent to New York, some few lots were sold in this city and some to private individuals from time to time, of which no regular account was kept. The men estimate these at about 250, making a grand total of between 1,400 and 1,500. The best days' shooting were as follows: Sept. 18, 80 partridge, 1 woodcock; Sept. 28, 30 partridge, 3 woodcock; Oct. 2, 34 partridge; Oct. 12, 27 partridge and 16 woodcock; Oct. 19, 32 partridge; Oct. 30, 36 partridge and 5 woodcock; Nov. 7, 37 partridge and 1 woodcock; Nov. 12, 38 partridge and 8 woodcock; Nov. 26, Dec. 10 and Dec. 24, 30 partridge each day. These were only the birds sent to New York. The poorest day's work was Sept. 27, 5 partridge and two woodcock. They were out 20 days in September, 21 days in October, 7 days in November and 6 in December, a total of 54 days, an average of about 26 birds per day.

COMBINATION JACK AND FISHING LAMP.—A recent visit to Bridgeport, Conn., when we had the opportunity of inspecting the Jack-lamps manufactured by the White Manufacturing Co., has convinced us of their great excellence. Former Jacks made by the company used kerosene. Now kerosene, though admirable in its way as an illuminating fluid, has the disadvantage of a disagreeable smell. The hunter using a Jack sometimes found that his hard-tack or bacon, impregnated with hydro-carbon, was not as palatable as if flavored with Worcestershire sauce. Then again, kerosene cannot always be conveniently carried. To do away with a fluid lamp entirely has been long the study of the White Manufacturing Co. Quite recently they have used candles, and by means of a most ingenious arrangement a full supply of air is given to the candle so as to produce the most brilliant illuminating effects. The light is perfectly steady, and there is no overflow of melted wax. We should suppose it was exactly the light sportsmen would want, not only for shooting purposes, but for camp use. The White Manufacturing Co. tell us that they have disposed of quite a number of their special articles in Germany and Russia, and trace their sales entirely to their advertisements in the FOREST AND STREAM AND ROD AND GUN.

—The publishers of *Fur, Fin and Feather* will send a specimen copy, containing all the game laws now in force, on receipt of 20 cents. Address *Fur, Fin and Feather* Publication Office, No. 149 Chambers street, New York.

GUN ACCIDENTS.—In *Land and Water* there is an excellent article on this subject, a brief analysis of which we give. A decrease in gun accidents is noted during the last year, which is attributed to the increased use of breech-loaders. Tho

Ties on nine.

**Pacific Gun Club, Jan. 16.**—The contest resulted in the following score:

|                                    |   |   |   |   |   |   |     |
|------------------------------------|---|---|---|---|---|---|-----|
| T. N. Berlingham (captain).....    | 0 | 1 | 0 | 0 | 1 | 1 | 0-3 |
| James Minihan.....                 | 0 | 0 | 1 | 1 | 0 | 0 | 0-2 |
| W. H. Gillman.....                 | 0 | 0 | 1 | 1 | 1 | 1 | 0-3 |
| Del. Sheldon.....                  | 0 | 1 | 0 | 1 | 0 | 1 | 0-3 |
| James Porteous.....                | 0 | 0 | 0 | 0 | 0 | 0 | 1-1 |
| Charley Parker.....                | 0 | 0 | 0 | 0 | 0 | 0 | 1-1 |
| Warren Bordwell (captain).....     | 0 | 1 | 1 | 1 | 1 | 1 | 1-6 |
| Charles Brown.....                 | 0 | 1 | 1 | 1 | 0 | 1 | 1-6 |
| J. P. Lacy.....                    | 0 | 1 | 0 | 1 | 0 | 1 | 0-3 |
| Dr. Booth.....                     | 0 | 1 | 0 | 1 | 0 | 1 | 0-3 |
| H. Baker.....                      | 0 | 1 | 0 | 1 | 0 | 1 | 0-3 |
| Mr. Fields (of Fields & Hoey)..... | 0 | 1 | 1 | 1 | 0 | 0 | 0-3 |

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,234.—[Ado. ABERT & IMBRIE, 38 Maiden Lane

## New Publications.

**FARRAR'S POCKET MAP OF MOOSEHEAD LAKE AND VICINITY.**—We have just received a copy of Mr. Farrar's new map of Moosehead Lake and the wilderness of Northern Maine, and unhesitatingly pronounce it the best map of that section of country, as well as the most correct, that has ever been issued, every attention having been paid to the smallest detail. It is printed on tough linen paper, and put up in a neat cloth cover to protect it from wear, and is the correct thing to accompany those who visit Moosehead for sport or pleasure. Published by C. A. J. Farrar, Jamaica Plain, Mass. Price, \$1.

**NOTTAL BULLETIN.**—We have received the last two numbers of this monthly, notices of which, in common with several others, have been unavoidably left over. We shall make room for them next week.

## Rational Pastimes.

**CONVENTION OF AMATEUR ATHLETIC CLUBS.**—A meeting of amateur athletic clubs will be convened at Knickerbocker Cottage, 456 Sixth avenue, New York, next Wednesday evening. This is the meeting which was to have taken place last August, but which was postponed on account of an unusually full athletic season. As matters of importance are to be discussed, representatives from all clubs in the vicinity of New York are urged to be present.

**INTER-STATE CURLING.**—The Inter-State curling match for the Hamilton medal, between representatives of New York and New Jersey, came off at Haledon Lake, N. J., Jan. 19, resulting in a victory for the New York rinks. Mr. James Addie, of the New York Club, won the medal to the skip, having scored the largest majority over his opposing skip, viz., 22. Below is given the full score:

New York—James Addie, New York Club, 35; G. Grieve, New York, 27; D. Foulis, New York Caledonian, 27; James Robb, Manhattan, 6; W. Symmers, Empire City, 29; S. McConchie, St. Andrew, 34; James Templeton, New York, 20; J. Matham, Brooklyn Caledonian, 29; C. McKeezie, Thistle, 16; W. Kellock, Yorkers, 33. Total for New York, 233.

New Jersey—James Stevens, Jersey City Club, 16; A. N. Horton, Paterson, 17; J. Dunlop, Ivanhoe, 23; R. Dowie, Paterson, 33; A. Phillips, Newark, 23; M. Thompson, Ivanhoe, 17; J. H. Van Houten, Paterson, 24; J. C. Bailey, Jersey City, 19; James Love, Jersey City, 33; George Faulhaber, Jersey City, 20. Total for New Jersey, 238.

## SPLIT BAMBOO RODS

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

J. D., Dayton, O.—Retail price of Hazard's powder is 75 cents per pound.

RIFLE, Newark.—I want a rifle for squirrel shooting or for deer. What calibre shall I use? Ans. 25.

CONDUCTOR, Boston.—We know of no better maps of Minnesota than those published by Colton & Co., 173 William St., N. Y.

W. W. T., Pittsfield, Mass.—Has there been a new guide and map of Moosehead and Northern Maine published since 1874? Ans. Yes, just issued by Chas. A. J. Farrar. Address him at Andover, Maine.

To HUNTERS AND TRAPPERS.—Persons contemplating hunting or trapping in any locality for a livelihood, will inclose stamp for information worth hundreds of dollars. Address H. Graves, Mount Vernon, Alabama.

W. G., Newark.—A correspondent who sends us several puzzling questions, and at the same time, not only declines to comply with our rule requiring names to accompany, but carefully clips off his letter-head to prevent recognition, is certainly not entitled to a reply.

J. L., Monon, White Co., Ind.—Do the standard works on ornithology say that ruffed grouse pair in the breeding season? Ans. The best works state that these birds do not pair. The males are said to be polygamous, and the intercourse between the sexes as promiscuous as among a lot of domestic fowls.

W. R. K., Lebanon, O.—What is the best gun to take to Florida? Does "Camp Life in Florida" tell what outfit is best to take? Ans. We are inclined to recommend the Baker gun, which combines the rifle and shot-gun. See his advertisement in our paper. "Camp Life in Florida" tells you all you desire to know.

F. N. L., New York.—Where can I get the National American Kennel Club Rules, and how much would they cost? Ans. They have not been published in book form, but will be printed in the *Kennel Register* when that is issued, if it ever is. They were printed, with slight modification, in the Premium List of the New York Dog Show.

YACHTSMAN, Boston.—1. Do yachts have to obtain papers at the Custom House? 2. Where can I obtain circulars, etc., of the Woodruff expedition? 3. Is it (the expedition) going? Ans. 1. They do. 2. Address Daniel Macanally, Esq., St. Nicholas Hotel, N. Y. 3. There is every reason to suppose that the expedition will start on time.

C. H. F., Plymouth, Mass.—Where is the best place for quail shooting in Delaware? Is there any locality nearer home equally good? Where can I buy live quail, and probable cost? Ans. You can get no quail shooting at this season in any State nearer than Delaware. Live quail are hard to get now, it is against the laws of many States to trap them.

T. F. M.—Will you let me know in your next number where I can obtain a book or paper devoted to Texas lands, stating the price of lands, stock and everything regarding cattle, ranches, also the amount of money a beginner would need to start a cattle ranch on a small scale? Ans. Buy the *Texas New Yorker*, 25, 30 and 32 Centre St., New York.

AN OLD SUBSCRIBER, Ellenville, N. Y.—Is there any difficulty in procuring central-fire shells (paper and metallic) at the gun stores in N. Y. city for breech-loading shot-guns of calibres 10, 15 and 20? Ans. You can get in paper shells, English, 4, 5, 10, 12, 16, 18 and 20 gauge. American paper shells are 10 and 12. In brass shells they run 8, 10, 12, 16, 18 and 20.

G. N. B., Delphos, Kansas.—Where heavy charges (110 grs.) are used in straight shells, is there some trouble from a powder crust forming just in front of shell that there is with bottle-necked shells? or are the straight shells any better in that respect? Ans. There is no difference between the two shapes of shell, as to crust or in any other way.

F. S., Boston.—Would a setter be injured by being chained from 9 A. M. to 4 P. M. by not being able to urinate, or from other causes? Take my setter to the office in the morning and return in the afternoon and am obliged to keep him chained while there. Ans. The dog should undoubtedly have access to the open air a couple of times between the hours you mention.

J. A. B., Boston.—What is the meaning of a wen-like excrescence on the under side of the neck of an eighteen months setter pup? Dog lively and appetite good. Excrescence as large as a goose egg, feels as if full of some fluid and tense. Ans. It is impossible to dispose of such a case without personal examination. Send for a surgeon to pronounce upon the nature of the growth.

F. A. S., Honsdale, Pa.—My spaniel pup, six months old, is recovering from distemper. Have fed him on table scraps, little meat, but plenty of milk. Passed worms yesterday and had a fit. Will worms cause fits? I keep him in a place comfortable enough during the day, but cool at night. What shall I do? Ans. The fits were quite probably due to worms. Give the area nut and castor oil afterward.

H. C. St., Joseph.—In a double bird match the other day, the man at the score fired at the bird on his right, missed, and then killed it with the second barrel. Referee declared both birds lost. Was he correct? Ans. In a double match both birds must be fired at. The shooter having missed the bird on his right, he ought to have paid his attention to the other. The referee was right when declared both birds lost.

MOOSE MUFFLE, Andover.—Is there any other inn than Capt. Ayer's at Sinepuxent Bay which you can recommend to a sportsman? Ans. Yes. James B. Powell's hotel on the inland shore of Sinepuxent Bay about five miles from Berlin. He has boxes sunk on the Beach directly opposite the house, has a good sail boat, small boats and a fine stand of live decoy geese and most comfortable quarters throughout.

SECRETARY, Philadelphia.—Our club intends paying a visit to Betterton, Md., next season to enjoy the perch, which they say are very numerous and large. Can you enlighten us any on the above subject? Ans. Betterton is a very popular resort, and affords fish in abundance. Many Philadelphians go there every season. You can find out all there is to know by inquiring of John Kridler, cor. Second and Walnut Sts.

BACK-ACTION, Newton.—Could you tell me where to go next spring to get some good goose shooting not far from here? How would Canaan, Conn., spoken of in the "Gazetteer" do, and in what month should I go. Ans. No geese in Canaan. You will have to go to the Long Island coast for geese, say to Good Ground, or Peconic Bay, on South Side. We have replied, in a general way, to the question of mixing Dittmar powder.

J. A. D., Boston.—1. My Newfoundland, eighteen months old, barks at horses and vehicles. He knows he is doing wrong, but I cannot give him a thrashing when in the act. How shall I break him of this habit? 2. He ought to be old enough to care of himself, but he runs away from other dogs. Ans. 1. Punish him in any way and keep him tied up for a while. 2. He is too young to fight. With age courage will come.

E. G. B., Hillsboro.—1. Which make of shell do you think best? 2. Was—once of the firm of—&—? 3. Is it—as good a single breech-loader as any made? 4. What are the Draper shells worth per dozen, and who can supply them? Ans. 1. Respectfully decline replying to. 2. He was not. 3. An excellent arm, and stands very high. 4. Price is cents each; can be had in any of the gun material stores in New York.

GREENWOOD.—You will confer a favor, and set a mooted point at rest, if you will state through the columns of FOREST AND STREAM, whether or no, fishing through the ice for perch in Greenwood Lake is legal, and, if so, during what month? Ans. The law as to close time applies to perch and bass alike. They cannot be taken from Jan. 1 to May 20. It prohibits any fish being taken, except minnows, bullheads and eels, for bait. Fine for violation, \$10.

J. F. A., Stafford Springs, Conn.—My Gordon setter has some disorder about the head. Dog eighteen months old. His ears are so tender that if you touch his head he will cry, and he keeps scratching them. There is an unpleasant odor from his head; otherwise lively and feeds well. Ans. Your dog has canker of the ear. Keep the ears clean by washing them with warm water and pour in daily a weak solution of lead water. Put a cap on the dog's head to keep the ears from being shaken.

W. S., Rouse's Point.—1. I have a B. L. gun, 34 lbs., 30 in. long, 12 gauge, choke; now, what will be the load for this gun to shoot 18 rods, etc.? 2. Where can I procure a book telling me of the different loads for different gauges? 3. Is a Chas. Webley gun a good one? 4. What is the No. of powder you would use in a breech-loader for general shooting? Ans. 1. You could not shoot 18 rods if you tried, at least with a shot-gun. 2. Hallock's "Sportsman's Gazetteer." 3. No better gun maker. 4. Use F., or No. 6, Orange Lightning.

C. St. G. S., Bonneau's.—You say that a shell should fit chamber of gun. Bow long is the chamber of a \$45 Remington and what length of shell could be used with advantage? 2. Do the U. M. C. Co. make straw-colored shells of different lengths. 3. What precautions must be used in using Dittmar's powder? 4. Ans. 12 gauge 2-16, 10 gauge 2-6 brass, in paper 2-8 and 3 inches, because length must be allowed for crimping. 2. They make various lengths. 3. Too long explanations would be necessary. Must refer you to back numbers.

CONSTANT READER, Summit, N. J.—1. What kind of game is there near St. Paul, Minn.? 2. What kind of dog would one want for general hunting in Minn.? 3. Would a hound be of any use there? 4. Is the climate good? Ans. If "Constant Reader" would read with his eyes open, he would find his questions answered many times in his paper. One of its most conspicuous features at present is the series of Minnesota letters from the Editor. Climate fine; hounds, setters and pointers all used and useful. Deer, grouse, pigeons, ducks, geese, rail, etc.

C. E., New York.—Does a person require a permit to collect bird skins in New Jersey or New York States; if so, where can it be procured? What is the best work on taxidermy? Ans. The laws permit you to shoot for scientific purposes, but you must prove your intent, or suffer penalty. Cones' "Manual of Ornithology" and Maynard's "Naturalist's Guide" are the best works on taxidermy. For list of several hundred works on sport and natural history, see Hallock's "Sportsman's Gazetteer," published to save you the trouble of asking the questions you have above.

BUSKHAUSER, Fort Clark, Texas.—Will you be kind enough to tell me the name and price of an instrument used to draw out shells when they stick—a pocket instrument? Also, the price of rubber boots for duck shooting, knee high, and also hip boots, and can they be sent by mail? Ans. Send to Dudley & Co., Poughkeepsie, or to Stoddard & Co., Washington, D. C., for carriage loader. "Dudley's" is the cheapest and simplest, \$1.50 to \$2; Stoddard's, the most complete and heaviest, \$6. Rubber goods can be bought of Hodgman & Co., 57 Maiden Lane; knee boots \$4.50, hips \$6.50. See advertisements in our paper. Cannot send over four pounds weight by mail.

H. P., Waterville, Maine.—Have a Scotch colley pup six months old. Has always been well until lately. Food, mush and milk. Was taken with convulsions and frothing at the mouth. Breathes a little hard. Was better to-day. I gave him some milk; as soon as he drank it he had another fit. Must have had convulsions for ten minutes. Then got up and commenced to travel round and round. Has discharged worms. Is better as I write this. Will you tell me what was the matter and what to do? Ans. The fits were probably due to intestinal irritation produced by the worms. Give him some areca nut followed by a dose of castor oil.

C. M. S., North Dunbarton, N. H.—Can you give me any information through your next about Florida? Whether I could find any shooting and fishing, and also what sizes of shot to take? Would a fishing rod which was made for striped bass be serviceable? What can I get good board for in the interior by the day or week? Ans. You will find the whole story in Hallock's "Sportsman's Gazetteer," or in "Camp Life in Florida," price \$3 and \$1.50 respectively. You can use hand lines or rod and reel, but shot or dust shot according to the kind of game you are after. Board from \$2 to \$12 per week, according to location and accommodations. Your fishing rod will answer well for very many kinds of fish.

C. M., Dauphin, Va.—To preserve autumn leaves follow the directions given by us some time ago: Procure some sheets of blotting paper, and place the leaves to be preserved between them—taking care they do not touch each other; then at intervals of about a half dozen of the papers lay either a folded newspaper or a piece of card-board. When all the leaves are arranged, place the papers containing them upon a smooth board, with another board on top, and upon that a heavy weight; let them remain in a warm room for a day, then replace them in dry fresh papers. Do this for a few times with autumn leaves, but often with ferns, etc., as there is more moisture in the latter, and you will have fresh-looking ferns and leaves as natural as if just gathered.

ERNEST, 203 Third Ave., N. Y.—1. Will it be possible for me to attend the meeting of the American Fish-Culturists Association? 2. Will the reports be printed? If so, when? How can I get one? 3. Give me the names and addresses of persons raising trout successfully for market? Ans. 1. Meeting open to all, and the association would be glad to make you a member. 2. Reports now in press. Apply in about a week to the Secretary, care of E. G. Blackford, Fulton Market. 3. Ira Smith, South Oyster Bay, L. I.; Gardner, Kittridge & Sherman, New Bedford, Mass.; H. F. Donseman, Fish Commissioner, Wis.; Levi Hayward, Gardner, Mass.; J. B. & F. W. Eddy, Randolph, N. Y.; Robinson Osterhout & Bro., Moscow, Pa.; Stone & Hooper, Charleston, N. H.; Geo. F. Farlow, New Bedford, Mass.; D. B. Wesson, Springfield, Mass.

MEMPHIS, Memphis, Tenn.—1. Where can I purchase a good reliable map of Florida and the Gulf States? 2. Is the hide and tallow business very extensive in the States of Georgia and Florida? 3. Is there a book published giving the mode of building and the various ways of paddling a birch bark canoe? Ans. 1. Althorp's map, price \$1.50, can be obtained at the office of the *Florida New Yorker*, 34 Park Row, New York. 2. There is a large but scattered business done in hides, the principal being located in New York chiefly and the buyers traversing the States and picking up lots haphazard, or at stated depots. Very little done in tallow, though we don't see why not. 3. No book of instruction for birch canoe. Some information can be gathered from "Hallock's Fishing Tourist." Also, see full particulars for making them in FOREST AND STREAM, July 3, 1875.

E. L. McP., Scottsburg, N. Y.—1. Previous to last winter in the neighborhood where I live we always had quail, but being on upland and owing to the large amount of snow we had they were not able to survive the winter. We would like to get them back again, and on low lands three miles distant there are quail. Now, do you think if we should trap some of them, say in the latter part of this month, or in February, and put them out in our grounds in the spring, they would be likely to stay, or would they go back again to the low lands? 2. After trapping them, which place would be best to keep them in till spring, an inclosure made so that they can be on the ground, or a room in a building with plenty of gravel in it? 3. Should each pair be put in a separate apartment several days before putting them out in spring? 4. Which day does the close season on partridge commence, the first or second day of January? Ans. 1. We think that they would stay and breed with you. 2. The inclosure if it could be made vermin tight, but perhaps the room would be safest. 3. Yes, better so. 4. January 1. December 31 is the last day on which it is lawful to shoot.

E. P. D., East Orange, N. J.—1. I have a canoe, 14 ft. 3 in. long, 30 in. wide, and would like to know if putting an outrigger on it (as per plan) would hurt the speed any in sailing. I thought of putting it out about 5 ft. from centre to centre (see plan). The boat is a good sailer now, but have been told that it would bear more sail. The rig now is mainsail and jib; mainsail runs 4 ft. on mast, gaff 33 in., boom 5 ft. 9 in. long; jib runs 4 ft. on mast, bottom 46 in. long. 2. Now, I would like to know how much sail she will bear with safety, and will the outrigger hurt her speed? I want sail enough to make her a much faster boat. Ans. 1. An outrigger on a boat as small as your canoe would probably diminish its speed under sail one-half, and would greatly interfere with paddling. 2. The amount of sail your canoe will carry depends upon its stiffness, and as you do not give a diagram of its midship section, your question cannot be answered with certainty. If the canoe is a "Rob Roy" it has quite sail enough; while, if it approaches closely to the "Nautilus" model, you could carry a mainsail of 6 ft. hoist, 9 ft. leech, 6 ft. boom and 3 ft. gaff. Judging from the present position of the mast, you would, with such a mainsail, need your present jib and another sail of the same size set on a mast placed about 5 ft. 6 in. from the stern.

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCUATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

(POST OFFICE BOX 2832.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 24, 1878.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,  
Business Manager.S. H. TURRILL, Chicago,  
Western Manager.

OUR OBLIGATIONS TO THE NEW YORK HERALD.—Our thanks are due to the greatest of American papers for the announcement given in their columns of THE FOREST AND STREAM AND ROD AND GUN gold medal for team shooting.

FIELD AND RIVER.—We specially commend the *Field and River*, a neat monthly journal, published at New Brighton, Pa., to our readers. Devoted to the woodland, farm and garden, and field sports, the general information it imparts is excellent in character. The *Field and River* is neatly printed, and is attractive every way.

MR. MATHER'S RETURN.—We are pleased to announce the return of Mr. Fred Mather, after an absence of three months, when he visited the principal fish culturists' establishments of England, France and Germany, as well as the most important aquaria. He has returned loaded down with notes (not bank notes) on the fish markets and fisheries of the Old World. We trust soon to be enabled to lay before our readers the results of Mr. Mather's experiences.

THE "AMERICAN AGRICULTURIST."—Some years ago the *American Agriculturist* gave to each of its subscribers a sample of sorghum seed, and the result was that the face of the country was soon covered with fields of sorghum. Now it donates a \$1.50 microscope of thirty-six magnifying power to each subscriber, and we've no doubt that all the minute things in earth, air, and water will now be investigated. We believe the *Agriculturist* has something like 120,000 subscribers; we therefore leave it to our readers to imagine what an impulse will now be given to science. More than this, what a stir will be excited among the squemish, whose curiosity will prompt them to examine into everything they eat, or drink, or use. We anticipate a panic among the greasers. We have used microscopes all our lives and never saw one nearly equal to this at double the price. So the person who subscribes to the *Agri.ulturist* for \$3 will get much more than the worth of his money.

## SCIENTIFIC NOMENCLATURE.

THERE is among outsiders, and among many who want to be regarded on the inside in matters of natural history, a great miscomprehension with reference to scientific nomenclature. It is made evident in the apparent idea that it is an affectation to use the terms, and also in the habit of deploring the continued changing of scientific names. The self-exalted specialist is careless and derisive of the ignorance of the public in the matter, and will not condescend to explain:

"They could not understand—oh, never!  
"Tis something eminently Greek;  
"Tis something intricately clever."

Did not Agassiz, in the estimation of many readers infallible, call the big-mouthed black bass *Grystes nigricans*; thereafter, Gill, the accurate, establishes his name as *Micropterus nigricans* (Cuv.) Gill; and, later, Mr. Goode bows to the Professor's suggestion, and would have us drop this name far down the page, among the synonyms, and place at the head *Micropterus Floridanus* (Les.) Goode. Then, Professor Cope offers the opinion that Lacepède's reference to *Micropterus* is most absurd, and suggests that Rafinesque's *Callurus*—which interpreted is beautiful tail—be adopted. Now comes Jordan, ferret of old lore, and points out to the Professor that that erratic enthusiast of the early part of the century, Rafinesque, had described the bass as *Lepomis pallida*, the Professor yields and *Floridanus* is demolished—*Lepomis* has already been squelched—and *Micropterus pallidus* (Raf.), Gill and Jordan, is the next ten-pin which invites the bowler's aim. If we refer to a paper by Theodore Gill, "On the Species of the Genus *Micropterus* (Lac.) or *Grystes* (Auct.)" we find seven stately classic binomials, used in all some eighteen times by twelve authoritative writers since 1828, and all knocked into a cocked hat in 1873.

All this time—he began early—Seth Green goes on calling him "Oswego Bass," with high contempt for "the literary fellers" and their mouth-wrenching names. He knows what he means; can tell him at sight anywhere, and can even stand on his feet before the audience of "fish-sharps" at the February meeting, and stand the cross-fire of questions from the famous ichthyologist, and hold his own without confusion; doubtful, in fact, but that "he held the fort" after the battle ended. The point in dispute was: Whether both species, black bass and Oswego bass, *sic* Green, and *Micropterus salmoides*, and *Micropterus nigricans*, *sic* Gill, were both found, as asserted by Seth, north of the great lakes in the Dominion of Canada. The fun for the audience was something like that afforded in reading Mark Twain's recital of the colloquy between Scotty Briggs and the minister when he went to ask him to preach Buck Fanshaw's funeral sermon.

Why is not good English sufficient, and what is the use of scientific names? *Strongylocentrotus drobrachiensis*; speak it resonantly and see if your mouth doesn't feel as if a cross-cut saw had been drawn through it; and yet these names have been coined by hundreds; so that, a certain scientist claims, that, besides the ordinary vocabulary of a few thousand words which an educated speaker of English uses, he has an additional lot of twenty-thousand scientific terms. You might naturally expect him to have the bronchitis.

Professor Baird, in his reports, has shown us something of the confusion prevailing in common names as they are applied along the coast. Now take the word salmon. The definition given by Webster is "A fish of a yellowish red color, of the genus *Salmo*"; it is found in all the northern climates of America, Europe and Asia." Then a fair wood-cut, with the word "Salmon" beneath, and a few lines describing habits, weight and food qualities. A meager enough definition, and, at least, partially untrue. The appended note indicates to those who know the species, that it is intended to apply only to the salmon of the rivers of Scandinavia, Great Britain, the Rhine and the rivers of the east coast of America east of the Housatonic. This is the fish entitled to the name, by priority and long possession. But go to the rivers of the Pacific coast, to the streams emptying both sides of Bering Sea, to Kamchatka, Siberia and the north coast of Europe. If you do your duty by the rest of us you will correspond for FOREST AND STREAM and tell us all about the fish you see and angle for. Suppose you should be limited to the word salmon for such of the genus as should not come under the nearly-equally diversely applied terms of trout and salmon-trout, and imagine the impatience and disgust of the men of the rod, to say nothing of the lofty contempt of naturalists and amateurs at your motley assemblage of little and big fish, of rank and oily with toothsome kind, and of many which the art of Conroy and McBride couldn't tempt to "rise to the fly."

But, worse still, you shall go to the Ohio River and its tributaries and buy salmon, and you will be furnished with wall-eyed pike, glass-eyed pike, yellow pike-perch, dore, pickerel, pike and jack; thus I am enabled, by the use of these names, to make clear to the dwellers in different parts of the country the one species meant. But, says the Lake Erie man, the trouble is they call the fish by its wrong name; let them learn to call it (?) "pickerel."

Now, you may go to the Carolina coast, and they will sell you all the trout you wish, and deliver to you squeteague, chick-wick, weak-fish, blue-fish, salt-water trout or summer trout. With this list of names I am enabled to make evident to the residents of New England, New York, New Jersey and of the coast southward the single species of fish I refer to, which the South Carolina fisherman, in good faith, has sold

you as trout. Why don't they learn to call it properly the weak-fish, says the New Yorker.

Did you ever see the indignation, too deep for words, when you tell the aged, local authority on piscatorial questions, "That isn't a herring, it's an alewife; herrings never come into fresh-water." You are apt to appreciate the isolation of Crusoe's desert isle, as the old gentleman walks silently off and leaves you alone on the shore. Now you might have told him it was a *Pomolobus pseudoharengus* and he'd willingly wait to see what kind of a foreigner you were; but, to dispute this absolute fact, which every child and nigger has known from the time of General Washin'ton's fishery to the present, and to tell him that it is an *alewife*, when he knows that the moss-bunker, the pogy, the pogbuden, the panhaden, the hard-head, the skippaug, the bony-fish, the menhaden, the bug-fish, the white-fish, the fat-back, the yellow-tail—now you will all know the fish I mean from Massachusetts to Albemarle Sound—is the alewife, as well as he knows that his wife's name is Hannah, is too preposterous, and, in fact, impudent. So that if the scientific name had no other value, it might be of some purpose as a sort of pacificatory compromise between sectional prejudices for old names. But the naturalist will explain to you that its precision, *sic*, as applied to the one species of fish, is a matter of importance, and that the naturalists of all nations know immediately what you refer to. And then he would tell you that the relation of this species to the whole series of animal life was to be traced from the name given to the genus, the family which comprised this genus with other genera, and the order in which was grouped this family with other families, and the class which embraced this order with other orders, and so on to the animal kingdom, which, with the vegetable kingdom, takes in all organic life, and is, in this general group, to be distinguished from the mineral kingdom. Then he might explain how to his voluminously stored mind came up, at the inspiration of this name, the points of structure, the embryological history, the geographical distribution, etc., all of which, to the thorough student, it might actually do.

The point of objection is, however, to the continual changing of the names. Many popular writers, appreciating the advantage of precision in the scientific name, at the cost of considerable trouble and labor, get the accepted scientific names fixed in their minds. To discover, a short time afterward, that some acknowledged authority has revised the nomenclature, when they have just settled themselves confidently in the assurance that they have mastered the matter, and are prepared to edify their friends in print or speech, with lumps from the dead languages, is exceedingly annoying.

Now, this matter of change has occupied the minds of the scientists for a great many years, and grave sessions of the British Association of Science, and of the American Association for the Advancement of Science, have sat in serious convocation over the questions which it involved. Printed copies of their decisions have been sent abroad, prescribing the restrictions under which the changes are to be made, meeting with acquiescence from many, and exciting dissension among others.

But there are many who want to know why there should be any change at all. To begin, where the Irish philosopher said all beginnings should be made, at the beginning, there are exact sciences, but zoology is not one. It is not as inexact as metaphysics or theology; but its truths do not receive their positive fixity in a few years or an age. It is rather a progressive science. Now, I am not going to analyze the methods of Aristotle, Linnaeus and Cuvier, and bring the stages of progress up from the time Adam gave the animals common names in his zoological garden. But it is clear to all that in those branches of science relating to zoology we know more and more from generation to generation. In anatomy, physiology with regard to form in all its variation, to color in all its gradation of tints, as to the extent to which any species exists over the country or world, and also, the possession of numerous specimens of each species and variety in our museums, greater advantages are afforded to the student almost in each successive year. The generalizer of one age takes into consideration all the facts the fact-gatherers have accumulated, and writes out his system and theory; but these fact-gatherers in science are the most industrious men alive. There is not daylight enough in a day to satisfy them, so they work on into the night. The facts accumulate continually in the form of stuffed skins, of alcoholic specimens, of skeletons and anatomical preparations, of recorded notes on the embryological period of life found under the tube of the microscope, of notes on the anatomy and physiology of animals found in dissection and vivisection. So that soon the work of the former generalizer upon a meagre collection of facts is found faulty; and now Owen and Muller come forward and leave Cuvier's system a thing of the past, which has served its day, while Huxley, later, declares his discoveries, and Owen is honored only for what he has been, while Darwin proffers his theory to stand the test of the accumulating evidence of to-day and the future. This 'in the higher walks of scientific truth-seeking. But to get back to the question of name changing.

Peter Kalm, the traveler, and Gordon, the naturalist, collected in the United States and sent specimens to Linnaeus in the middle of the eighteenth century. The species differed entirely from the forms of the old world which Linnaeus had around him, and in his later editions, at least, he gave and published names to the genus and to the species the binomial term, which the naturalists agree shall be the only one recog-

\* Called also hyach and gaspereau in Nova Scotia.—Ed.

nized. In few cases would he have more than one specimen of a species. Cuvier was supplied by travelers and residents in the United States. And about the same time came Lesueur, Rafinesque, Dr. Mitchell, Audubon and Wilson collecting and naming, when the mink, the common crow, the leather-back turtle and the brook trout were new to science. From Linnaeus to the middle of this century a very large number of species, or supposed species, were given names. Now, in order that those names should stand, several things were requisite pertaining to the animal—its genus, species or variety. The name which comes first—the generic name—under which certain species, having structural characters in common, are collected into a group, must have received its final limitation. All the forms related to it are to be studied and the decision made that all the members of the group are sufficiently homogeneous and related in their character to be retained together under the name of the genus; if not, it must be divided into as many groups as seem natural to the judgment of the student, and new generic names established. The species are re-organized under their respective genera; the old name is left attached to one or more, as the case may be, but the rest drop it, and the new names precede their specific titles.

Next, a prolific cause for change is the identity of species. This involves the apprehension of the term species, which presents itself to the mind of each naturalist, and of which there is no acknowledged universal definition. It is well established that different geographical regions possess forms varying only slightly from similar forms in other regions, but so apparent that they are readily distinguished. The practice with some naturalists is to regard these forms, if the characters are constant—that is, found to exist distinctly in all the specimens in each group respectively—to constitute their different species. But, if the extreme types are found in a series of specimens, however considerable, to imperceptibly grade into each other, they are then termed races or varieties. Now, it has been the case that two strongly characterized forms have been found, from separate localities, and, without hesitation, made separate species. In the course of time specimens from intervening regions are collected, and, finally, a chain of gradation is established, and, of course, the later established species loses its distinguishing name and is known under the common term applied to all.

Again, all this establishing of species depends for its accuracy and permanency upon the very variable amount of ability and judgment in the different naturalists. A careless, or credulous, or over-sanguine, or easily persuaded man, may make many species where there is little foundation for one, as in the case of Dumeril in the sturgeons and in the gar-pikes. The conscientious worker, in later studies of the same group, must reduce the names to the position of mere synonyms of the prior name applied to the species.

This suggestion of priority now brings the other principal cause for changes, research through the literature; the study of all the previous authors who have written up the species; the careful sifting of their descriptions, to determine what species they have had in hand, and to which they have applied the name; and then, after conclusions are made, to affix the name having priority of date, and to reduce all others, no matter how extensively used, to the character of synonyms.

A late student of the *Salmonidae* thought he saw the necessity staring him in the face of throwing aside the accepted name of the brook-trout, so long used and liked, and familiar in the pages of American authors on field sports. *Salmo fontinalis*, has it not a pleasant sound? You can scan it like a line of Virgil. This vandal proposed to give us *Salmo omiscamayus* in its place, because a Dutchman named Walbaum—and a very poor naturalist he was—described a small *Salmo* with spots under this name in 1793. He decided in the end that Walbaum's fish was a smolt, the young of *Salmo salar*.

In the plants of North America and Europe this changing of scientific names seems to have nearly reached its limit. In the classes of vertebrates there will still be many changes, as varieties, species and genera become better understood, and the priority and correct application of the older authors' names become known.

You now see that it marks the progress of science, and you will hereafter have the satisfaction, as you see these "household words" disappear, of knowing that science is advancing.

RUNE.

## THE NATIONAL RIFLE ASSOCIATION.

The steps taken by the National Rifle Association to increase the representation given to the Army, to State military associations and to affiliating clubs, instead of being appreciated as a concession, appears to have opened the way to fresh assaults. It would be difficult to find any logical reason for the course. Why the gentlemen, who for the last six years have so unsparingly devoted their time and money to create a public interest in rifle shooting, should all at once be discovered to have lost all right to continue to represent American riflemen is a mystery. It is not that they have failed in their efforts, because all concede that it is through their exertions that American riflemen and American rifles now lead the world. It is not from any failure upon their part to support the honor of our country, for our visitors have united in praising to the echo the fairness and hospitality with which they have treated and entertained them.

The only reason to be gathered from the published criticisms is that they have not seen fit to implicitly follow certain newspaper suggestions, and turned over all their powers to a convention composed of delegates from the different rifle

clubs in the United States, or acquiesced in a scheme for the formation of a body, to be composed of delegates from each State, with the General of the Army at its head, having a grand central range at Louisville or Cincinnati, at which all international or inter-State matches should be shot, to the exclusion of Creedmoor.

It may perhaps be that the six-years' practical experience of the present managers of the National Rifle Association has failed to give them that knowledge of rifle matters which is possessed by their newspaper critics. It would also perhaps be asking too much to expect that any gratitude or acknowledgment of their services should be expressed by those professing to be champions of rifle practice for their unselfish exertions to advance that cause. Yet it might be expected, in the interest of gentlemanly and sportsmanlike feeling, that their conduct might be discussed without referring to them as a "ring" or a "close corporation." That this has not been done is however but another instance of the ingratitude of republics.

After a careful examination of the plans proposed, it is clear that the gentlemen of the National Rifle Association have given another instance of their common sense in declining to adopt them.

The idea of the new association, headed by Gen. Sherman, with directors from each State, is magnificent—on paper. Considered practically, it is a humbug. As the *Chicago Field* rightly said, "We are a nation of plain business men, and should cut out our national associations of plain, practical, business-like stuff." To manage a rifle association, to operate a range and to carry an international rifle match to a successful conclusion, is a business. It requires from those undertaking it thorough familiarity with many details, only derived from practical experience and constant, unremitting attention for several months. It needs a large corps of trained markers, scorers and clerks, and large and expensive plant, none of which can be improvised; and, above all, it requires a great deal of money.

During the arrangements for all the international matches, the officers of the N. R. A., though prominent business men, met weekly for months to perfect them, while the sub-committees were at work all the time. In fact, many of the officers gave up their usual vacations to attend to their duties. Even with this spirit of self-sacrifice the work was greatly interfered with from the difficulty of getting a quorum together on occasions of emergency. The expenses of receiving and entertaining the foreign riflemen of 1876 were over \$8,000, and the association was left \$2,000 in debt. The expenses of the last match were about \$5,000. The total receipts and disbursements of the National Rifle Association during 1877 were \$36,000, and yet it was only by the most judicious management they squeezed through the year with a balance of \$26. This, of course, does not include the expenses of the private hospitality extended to the visiting teams by the directors and members, individually, which were very great.

That their duties would not be, could not be, performed by such an impractical body as is contemplated in the proposed scheme is too self-evident to bear contradiction. It would only be by a miracle that they would be got together, and they never could be kept together long enough to accomplish anything.

The idea of a central range is no less absurd. Where is the money going to come from to erect it, and how is it to be supported? Outside of Creedmoor there is no range in the country fit to be used for such a contest as the Centennial or the *Spirit of the Times* Matches. To procure and fit up a new one near any large city would cost from \$10,000 upward. There has been over \$50,000 spent on Creedmoor, while the Rochester range cost \$8,000, and that at Buffalo \$15,000. Outside of the State of New York, with the exception perhaps of California, is there a range in the United States where the prizes offered at any meeting exceeded \$1,000 in value, or where there have been as many as fifty entries in any one match? It may be said that Wimbledon is only a temporary range, but that argument does not apply. While that range is not shot over all the time, it is not used for any other purpose. The butts and targets remain, and all that is required at each meeting is to get things into working order. To do this the British N. R. A. have a trained staff of paid officials and the aid of all the regular troops they need. Above all they have plenty of money, their surplus being nearly \$100,000.

Does any body imagine that in these hard times the necessary funds can be raised to erect a range simply for international matches, or the selection of a team? If it could, how would it be supported? If those in favor of this plan will refer to the report of Col. Wingate, the General Inspector of Rifle Practice, of New York, they will see the experience of twenty ranges of that State summarized in the statement "that it is to military shooting that a range must look for its support." And what is the experience of New York will be the case elsewhere. It requires a large number of competitors to support a range, and these can only be obtained from the military. This question of military shooting is the vital point in the whole controversy. We must recognize that the National Rifle Association is founded to encourage that kind of shooting. Long range and other descriptions of rifle practice are undoubtedly valuable as adjuncts to aid and develop public interest—but they are merely adjuncts. Whatever aid Congress may extend toward rifle practice will only be granted so far as its military features are concerned, and the same will be the case in the different States.

Any range, therefore, which is to be national, which is to

occupy toward the National Guard of the Union the position which Wimbledon occupies to the British Volunteers, must be located where it will be most accessible to the greatest number of the National Guard, or where the prizes are more attractive than are offered elsewhere. The only States where National Guards know anything about shooting, at the present time, are New York, California and Connecticut. The first has 20,000 men who are regularly trained and who resort to Creedmoor as competitors, and the riflemen of Connecticut come with them. No association can afford to spend more for prizes than comes back to them in entries, except such as are donations. But with this support the N. R. A. are enabled to offer a prize list which no other range not having a similar number of competitors can afford. The number of competitors in turn produce the best shots and make the honors of victory greater. It may therefore be assumed that, as British riflemen from Australia, Canada, Ireland and Scotland congregate to Wimbledon to compete against each other, American riflemen will inevitably resort to Creedmoor; and any attempt to build up a rival range or a rival association will be impracticable, until, at least, some State shall organize a larger force of riflemen than are to be found in New York and the neighboring States to serve as a foundation for such an opposition.

We must confess our inability to see why the action of the N. R. A. has not been generous in the extreme in regard to affiliating clubs, and riflemen in general. The \$25 affiliation fee just pays for the medal presented affiliating clubs, the printing of their scores in the annual report and the publications furnished them, and the privilege to use the range is given, without compensation, to all their members. The only reason why the amendment making their Presidents life members was rejected was a dispute as to its language. This is now being rectified, and will shortly be passed. This, however, was not necessary. If an affiliating club or any rifleman desires a voice in the affairs of the N. R. A. they can have it. Any club can make every one of their members life members of the N. R. A. by simply paying \$25 each. As the highest number of votes cast for any director at the recent meeting was but fifty-six, it will be seen that ten clubs having six live members each could elect whom they pleased. Surely it cannot be expected that they are to control the association without contributing in any way to its maintenance, or that they are to have more privileges than the regular life members, which would be the case if they did not make this payment. If it be too much trouble to go to New York to attend the annual election, would it not be just as much trouble to attend a convention? In increasing the number of honorary directors the N. R. A. have given a voice and vote to the army and to each State. They have also provided for the election of those whose services in the cause of rifle practice may entitle them to this distinction. It is said that this amounts to nothing, because these honorary directors will not attend. If they follow the example of the critics who have published the adverse views now under consideration they undoubtedly will not, because these gentlemen, though both honorary directors, never attended a single meeting at which the proposed amendments were discussed or offered a single suggestion upon the subject. It is to be hoped, however, that they will pursue a different course.

The advocates of a convention are scarcely more practical in their ideas than those of the "Grand Central" Association. A convention is cumbersome and unmanageable. Moreover, it would be a failure. Such a convention was called by the N. R. A. on Feb. 1, 1876, to be held during the spring meeting in May, and was only attended by the representatives of a few local clubs, who were picked up on the field. By the terms of affiliation another was to be held at the spring meeting of 1877, and but a single delegate appeared, and it was postponed till the fall meeting with the same results. This is only what might be expected and what would certainly result if another should be called. The interest in rifle practice is not sufficiently great to induce any one to go very far out of his way to attend a meeting of this description, and it is extremely doubtful if a single one of the clubs whose officers have written in favor of such a meeting would send a delegate 500 miles to attend it if it should be called. This is shown by the history of the Sportsman's Association and similar organizations.

When the rifle movement attains sufficient strength to induce the present scattering and disunited clubs to establish a solid organization in the various States, then such a project will be practical. The fact that there is no such an organization in a single State outside of New York shows that the attempt to constitute a national convention is premature. The Northwestern Rifle Association is a striking example of this. It was started some two years since, with the intention of bringing together the riflemen of Chicago and the Northwest. How many meetings has it had, and with what success? Let us look the matter fairly in the face. Substantially all the correspondence that has been published is from the various long-range rifle clubs scattered through the country. Is there a single one of them that has fifty active members? We know of none. Look over the reports of the various club matches published in our files. Do they average over a dozen competitors? Even at Creedmoor, with the stimulus arising from the great International Match, with the galaxy of riflemen attending the inter-State matches, and the fall meeting of the N. R. A., the magnificent prize so generously offered by the *Spirit of the Times*, and aggregating \$1,500 in cash, attracted but seventy-eight competitors, and these included the foreign teams. For the Wimbledon Cup

there were but thirty entries, while the military and short-range matches had about 200 entries each.

How idle then is the attempt at the present time, when rifle shooting is in its infancy, to overturn the organization which has created all that we now have, and to substitute—we know not what.

Let us rather unite to build up and strengthen the National Rifle association, by creating in each of the States an association of a similar character, by developing State and inter-State matches, by bringing in the military element to support the ranges throughout the country, to increase the interest, and to entitle the various associations to claim from Congress and their respective States that assistance which is necessary to make them successful and popular.

#### VACATION RAMBLES IN MICHIGAN, WISCONSIN AND MINNESOTA.—No. 12, Concluding.

By THE EDITOR.

BRETHREN: By referring to my preceding letter, you will find mention made of a firm, (actively engaged in the rolling business in Minnesota,) under the name and title of "Titans and Son, of Anak."

Some ethnologists incline to deny the existence of any survivors of this ancient family so conspicuous among the giants of the early periods, and kindly called my attention to the *Anakronism* when I was reading the proof-sheets. Not being infallible in historical reminiscence, I assented to a correction, and by marking out the comma between the words "Sons" and "of," (the text originally reading "Titans and Sons, of Anak,") I complaisantly sent the proof-sheets back to the printer, satisfied that wrong had been made right, and that history would be verified. The printer, however, instead of erasing the comma, simply struck off an "s" thus decimating the family of Titans without disturbing their genealogy. Of course I was surprised; but having been taught by twenty-six years experience as a journalist that compositors are censors in literature, I concluded to accept their dictum and suppress my rising chagrin. And I now write to congratulate my Minnesota friends upon having the descendants of so ancient, honorable, and industrious a family in their midst. I trust that the line will continue so long as there is a standing stick of timber left in the State upon which an *ax* (Anaks) may descend!

I have great reason to be proud of my Minnesota friends: "for once, upon a raw and gusty day, troubled [Mississippi] chafing with its shores," "having plunged in, accoutred as I was," by instigation of my comrade, Dr. D. Caesar Estes, and "swam to yonder point," etc., (as you will find by referring to Richard Grant White's new version of Shakspeare,) I found myself standing nude, destitute, joyless, and apart, in a chamber of the Merchant's Hotel, on Third street, St. Paul, waiting for my clothes to dry and a clean shirt to arrive from the haberdasher's. Ministering friends were rubbing with crash towels my chilled limbs which a long immersion in the river had stiffened, and while some ran my credit at the furnishing and shoe stores, others administered spiritual restoratives.

The situation was this:

Some four hours previous, two of us had started on an excursion down river in a clinker-built sprit-sail skiff, which was as cranky as a dug-out, and twice as assuring. It was the 19th day of September, and we designed a several days' trip, intending to beat the islands and shores for woodcock, snipe and duck, fish in the river for muskellonge and bass, and possibly wait for a deer in some of the bottoms where sign was conspicuous. Besides having impedimenta in the shape of a complete sporting outfit, as the Doctor and myself both had, and a large dress wardrobe of my own, our St. Paul friends had provided many luxuries which were carefully stowed in the cuddies and lockers. Wraps, rubbers, blankets, overcoats and tent, were housed under the decks, stem and stern; guns, rods and oars were made snug under the thwart; valises, boxes, and heavy articles were placed squarely awast; and the craft was trimmed with care and circumspection. With the mast unstepped but ready for use, we bade adieu to our friends on the levee and launched out on the broad river, the wind puffy, and the current running four knots an hour. A couple of miles below town it scooped out a big black hole sixteen feet deep, piling up the sand on "Pigseye Bar," as the pilots term it, and setting back in an eddy from a high bluff at a sharp bend in the river. We had scarcely got under way before we ran the skiff ashore and made sail on her, thinking she would bear it; then we pushed out into mid-stream again and—capsized!

I have never cared to investigate the cause of the disaster, lest I should place the blame where it should not rest. As the doctor said of a patient, I'm inclined to believe that "death resulted from a complication of diseases." The tableau, as I recall it, while swimming for shore in my encumbering corduroys, was a dissolving view of parcels floating off down stream and the doctor astride the overturned boat, calm, and buoyant in the vain hope of sculling the water-logged wreck to *terra firma* with a setting-pole! He had gallantly grabbed his gun as the boat went over, and with this sole relic on his lap, there the three were—the boat, the doctor and the gun—helpless, powerless, soaked, and useless. The mast-head stuck to the bottom, the doctor stuck to the boat, and the wet cartridges stuck to the gun; neither could get off. As the wreck gradually worked its way down stream with the current, I followed along shore, lugubrious and bedraggled, like some lone mourner at a funeral, and the only

attendant at the wake (I mean the wake of the boat). Finally, a tramp opportunely came plodding along the riverside, and cutting a long grapevine, he held one end, and I wading into the river with the other managed to reach the doctor's setting-pole: and so, with a long, strong, and united pull, we dragged the cranky craft to land and baled her out. Then we realized that we had suffered a baleful catastrophe. Little was saved except the equipments of the boat: only a rod-case containing a trolling rod and a Conroy-Mitchell bass-rod, and a big rubber bag, the tried companion of many travels, filled with old cast-off clothes and trifles of no value. An inventory of my own kit discovered a loss amounting to \$900, and the doctor's outfit was possibly \$800 more. Nothing was ever recovered.

Waiting patiently in my hotel room, as I began to say, after a walk of some two miles back to town, (the tramp meanwhile poling the boat up shore to the landing), I was gradually rubbed and limbered into form, and enrobed in new garments which Solomon might have envied. One of my most assiduous friends was Col. Allen, the hotel proprietor. He had pried into the rescued bag as soon as it arrived, and chancing to find a half-dozen soiled shirts, considerably ordered them to be sent to the laundry and returned in prime order with all possible haste. Never was an order executed with more alacrity or precision. Never was a lot of such worn, torn, and begrimed clothes, long discarded as apparel and assigned to cleaning guns, binding wounds, wiping dishes, and such like services in camp, restored to pristine purity in so short a time. No washing powders as yet popularly known, ever eradicated dirt with such celerity. Never were spotless ascension robes of Latter Day Saints ever substituted for the foul habiliments of their casting off with such comfortable and satisfactory dispatch. How beautiful the vestments appeared in their resurrection! Shirts minus their flaps presented only their immaculate fronts to the eye. Veterans which were sleeveless would have passed the scrutiny of a recruiting sergeant. Buttonless or bosomless, dismanted or curtailed, all put their best side foremost and invited the admiration of the crowd. And good Col. Allen privately rubbed his hands together with the complaisant satisfaction of one who has bestowed a blessing. It was unkind in the boys to dissipate the pleasing dream!

By the time our full toilet was completed a capital dimer was announced. Its conclusion was followed by congratulations, mingled with regrets and mutual pledges. The old salt-water dirge was sung in all its fervor, saturated with appropriate brine, concluding with the following stanza:

"Three times around went the gallant little ship,  
Three times around went she;  
Three times around went the gallant little ship,  
And she sank to the bottom of the sea, sea—  
And she sank to the bottom of the sea."

Just here District Attorney Chris. O'Brien happened to remember that I was penniless, and satisfying himself that my octogenarian relatives were well-to-do, proffered a temporary loan of \$10 until I could make a draft for funds. Col. Uline and Doc Warner sang "Auld Lang Syne," and the party adjourned to meet at the trap range the day following.

Such is the tersely-told story of our grief.

The festive days enjoyed in the vicinity of St. Paul will bear a long remembrance, clinched as it were, by our complementary duck hunt at Rice Lake, whose "passes" have been made famous by their holocausts of slain. Lakes are joined to lakes by marshes filled with succulent rice, to which the mallards, teal and wood-ducks resort for food in large numbers, the gunners taking their best opportunities in their morning and evening flights, as they pass to and fro. There are rails, also, in quantity, but as they are seldom in good flesh, are little heeded. Some Wilson snipe are picked up sometimes, and in the woods ruffed grouse abound.

Near the close of the month, when I set my face Eastward to return to office duties, Brother Ohandler handed me a pass over the Chicago and Milwaukee Railroad, with the terse injunction to stick to the cars if I wished to reach home without accident. The ride down the Mississippi Valley, through its picturesque scenery, is most engaging. The fantastic rock cliffs, the grain-capped bluffs, the sweeps of meadow land, the glimpses of the river seen through frequently recurring vistas, the bustle of the river towns, afford a panorama which changes with kaleidoscopic rapidity. At Lake City, where I left Dr. Estes, the sharer of my joys and sorrows, I briefly interviewed "the boys." My anticipated visit there was shortened to a few brief hours, made pleasant by the hospitable attentions of our mutual friend S. B. Dilley, Esq., whose kennel of Ranger stock is famous among sportsmen and breeders of gentle strains. Beautiful are the intelligent brutes he breeds and trains. First in degree and reputation is the celebrated champion "Ranger;" next, the best pointer in the New York Bench Show, the champion "Royal Fan;" then, the white bitch "Dolly," with a peculiar liver mark on the head, a magnificent animal and dam of "Royal Fan;" "Minnesota," a rare specimen of perfect form; "Chum," a liver pup of beauty, whose work in the field classes him A1; "Queen," winner of two prizes at Chicago; "Fleet," the winner of first prize for best bitch pup at New York; a pair of lemon and white pups out of "Minnesota;" these, with Dr. Luke Corcoran's "Bess," comprise the dogs I found in friend Dilley's kennel. Nearly all are pointers, a class of dog which chiefly engages his fancy and attention. He turned the whole gang loose for an airing on the morning when he drove me around in his hunting cart to interview the sportsmen of the town; and a grand sight it was to see them run! Not

all the unwonted bustle and distracting stir of a county fair then in progress sufficed to disconcert them or mar their good behavior.

I must tell you about this little episode: Having rested comfortably at my friend's house over night, and breakfasted sumptuously, we found but few hours remaining before the train left at 2 o'clock in which to make our visits. Now, Dilley has a spanking team of ponies whose conscientious principle it is never to go at less than a three-minute gait under any circumstances whatever. Over the prairie or through the town, around street corners, over crossings and gullies, or through the thoroughfares, no matter how muddy or how thronged with vehicles or pedestrians, it is all the same—they never break. Residents understand all this, and never hurry out of the way; they plod right on, and the team skips around with a dexterous turn. They have become so trained to these flanking tactics that they will not drive straight at anything: so, when Dilley wishes to enter the coach-house, he makes straight for the side, and thus strategically enters the door at the front. I think we must have made twenty calls after 10 o'clock that day. New Year's visits in New York were handicapped and beaten clear out of sight. Clinging to the seat like grim death, I held on bravely while we whisked around corners and jumped crossings, scratching gravel like mud, and kicking up clouds of white dust that covered us as if we had been dredged from a flour mill. The entire troop of dogs kept always in the van, helter-skelter, doing their level best, tails up, happy as jack tars when the commodore is aboard. It was fun to see with what acute discernment the old dogs would anticipate our movements, running *equo passu* when we abruptly turned a corner, never missing their foot or making a mistake; but the youngsters would go scooting far ahead in a straight line, like a hog on ice, and then fetching up on their haunches, wheel and make for the front again. That was the dog-gonest ride I ever had!

Well, in time we made the grand circuit, dined, adieued, and parted at last. The train rumbled off toward Chicago, and I jotted down a memorandum of the friends I had seen. First, there was "Uncle Dudley," (M. O. Russell, of the *Leader*), and his associate O. Jones, Esq.; then followed G. W. Lumley, President of the Lake Pepin Sportsman's Club and champion fly-caster, who won a Holabird hunting suit with Dr. Estes, Gen. Garrard and Wm. Morris as competitors; Dr. Garrard, the Mayor, and F. Rancourt the gun-dealer; Uncle Sam Doughty, the veteran goose hunter, who has the best lot of artificial geese I ever saw set up as decoys; S. M. Emery, a newspaper writer of note; Major J. E. Doughty; Oliver Gibbs, author of that very clever brochure entitled "Lake Pepin Fish Chowder;" the venerable Mr. Patton, the leading fly-fisherman of the State, and Dr. Potter, his son; G. F. Benson and his son; Major Van Vliet, President of the State Sportsman's Association, and perhaps others whom I have forgotten. It was a noteworthy day's work, and, as may be inferred, there was no Dilley-dallying on the occasion. I would fain have lingered longer among them, but the limit of my vacation was reached. That my travels were not wholly barren of interest or observation, the prolixity of my letters has shown.

I now come to a full stop, and as I abruptly round the period, I reiterate the injunction of the great and good "white-coated philosopher," "Go West, young man," and do not omit to send some portion of your vacation rambles in Michigan, Wisconsin and Minnesota. Brethren, adieu!

P. S.—In my letter printed last week, where I alluded to Mr. Jerome Marble's bag of 180 birds, I intended to refer to only one day's shooting, and not to the net results of his excursion. HALLOCK.

#### GAME PROTECTION.

CONNECTICUT.—*Stamford, Jan. 19.*—The efforts of last winter to procure live quail for propagating purposes will be resumed with greater vigor, if possible. We must import birds or have none at all. G.

NEW JERSEY.—The Bergen County Association are disseminating posters and circulars, and in other ways publishing the New Jersey game laws.

MICHIGAN STATE SPORTSMEN'S ASSOCIATION.—THIRD ANNUAL SESSION.—The regular annual session of this leading organization will take place on the 5th and 6th of February, at the Potter House, Battle Creek, Michigan. Arrangements have been made to render the meeting of the most attractive character. Papers on topics of vital interest will be read. Among them we may mention, "On the General Topics of Preserving Game and Fish," by ex-Governor John J. Bagley; "On the Propriety of Establishing Bench Shows, or Field Trials," by Mr. John E. Long, of Detroit; "Should the Taking of White Fish and Lake Trout from the great lakes and rivers be prohibited during their spawning season, and for a sufficient time thereafter for them to recuperate and become healthful food?" Eli R. Miller, Fish Commissioner, Richmond; "Should Wild (water) Fowl be protected by law in this State? If yes, what species, and when?" John Davidson, Monroe; "The Michigan Grayling—What must be done to prevent the annihilation of this excellent food and game fish?" Lyman D. Norris, Esq., Grand Rapids; "Ducks and Ducking," Hon. A. B. Turner, Grand Rapids; "Need of More Effective Protective Legislation," Prof. N. B. Roney, East Saginaw.

The session will probably last two days.

The officers of this Association are: E. S. Holmes, President; A. J. Holt, Secretary.

PROPOSED EXTENDED GAME SEASON.—*Buffalo, Jan. 1878.*—*Editor Forest and Stream.*—Weather unusually mild. A flock of five red-winged starlings made their appearance in the vicinity of the city, and a female red-head was shot on the Niagara. Both occurrences are without a precedent within the last twenty-five years. Game in enormous quantities still gorges the stalls of the dealers. They claim two months of surplus time after the close of the season to get rid of their stock. This annuls the purpose for which the law was framed, *i. e.*, the protection of the birds, since they are shot as long as there are buyers. It resembles in its working the sale of cheap and so-called slightly-injured goods by fire or water, which continue to be damaged as long as a credulous public allows itself to be duped. If a great amount of surplus stock on hand of any dealer calls for special legislation to protect him still further after having realized a handsome profit during the legitimate season, the logic should be extended likewise to others who depend on periodical profits, such as dealers in coal, stoves, or winter clothing. But the birds must be doomed to extermination to protect the dealer, who defies thus the whole purpose of the law. The last day of the shooting season must also be the last day on which a single game bird may be exposed for public sale. C.

**GAME LAWS ENFORCED.**—The Philadelphia Club, whose commendable zeal was mentioned last week, have been successful in their prosecution of restaurant keepers in that city, and have secured sentence against them for violating the laws respecting quail.

ARKANSAS SPORTSMEN'S CLUB. *—Little Rock, Ark., Jan. 17.—Editor Forest and Stream:* It is with regret and some mortification that I write to you of the dissolution of our club. It was formed for the express purpose of obtaining the passage of a game law. But, alas, the Granger element was largely in the majority in the two last Legislatures; and to reason with them on this subject was fallacy. The bill never saw the light, although it was very mild, and only included a few of the game birds and large animals abounding in this State. Becoming disgusted with our want of success, and not wishing to keep up an expensive organization for no practical use, we thought it best to dissolve, hoping a time may come when ignorance may be enlightened without the hard, stern lessons of experience. Already some of our farmers on the prairie have complained to me about the scarcity of game in their neighborhood, where a few years ago was plenty. It is the habit of some vandals to go out on the prairie every spring and gather the chicken eggs, shipping them to Memphis and Louisville by the barrel; and as soon as the few that are left are hatched they commence a merciless warfare of extermination. In a few years our chicken shooting will be but a pleasant recollection. Every kind of game is killed out of season by the negroes and white vandals, and we have no power to prevent it. Game of every kind has been unusually scarce this year; even the ducks, which are generally here in millions, seem to have entirely deserted us. However, the Grangers are not responsible for that.

“ONE OF THE CLUB.”

[We are sorry to chronicle any backward step in the cause of game protection, although we doubt not our friends have acted wisely. At a future time we hope to hear better reports from Little Rock.—Ed.]

## The Rifle.

## MATCH AT UNION HILL

FOR THE FOREST AND STREAM AND ROD AND GUN MEDAL.

We went to press too early yesterday afternoon to give the result of the match. The Jersey Schutzen Corps, the New York Schutzen Corps, the Independent New York Schutzen Corps, the Zettler Rifle Club, the Brooklyn Schutzen Corps and the Newark Shooting Society were each represented by their selected teams of twelve men each. We regret that we cannot now give the name of the winning team. Their laurels shall, however, in due time be recorded. In our next number we will give the full account of the scores of all the participants, accompanied by a cut of the medal, the design and workmanship of which have elicited very general admiration in rifle circles.

MASSACHUSETTS RIFLE ASSOCIATION.—*Boston*, Jan. 18, 1878.—At the annual meeting of the Massachusetts Rifle Association, the following gentlemen were elected to fill the offices for the ensuing year: President, Charles A. Longfellow, Esq.; Vice-Presidents, Col. Nat. Wales, James E. Shepard, Esq.; Treasurer, Salem Wilder, Esq.; Secretary, Horace T. Rockwell, Esq.; Directors, Salem Wilder, Esq., Capt. F. R. Shattuck, Capt. W. H. Jackson, J. A. Lowell, Esq., C. A. Longfellow, Esq., Capt. J. S. Stevenson, Capt. H. T. Rockwell, J. N. Frye, Esq., H. B. Sargent, Esq., Wm. Polanos, Esq., J. Wemyss, Jr., Esq., Albert Hebbans, Esq., Wm. Geinst, Esq., E. B. Souther, Esq., L. S. Hubbard, Esq.

NEW YORK RIFLE CLUB.—The scores of the New York Rifle Club, at its match, Jan. 17, for the Blydenburgh medal were as follow :

| Age             | Below | 200 yds. | 300 yds. | Time |
|-----------------|-------|----------|----------|------|
| J B Blydenburgh | 45    | 49       | 93       | 93   |
| G G Dudley      | 47    | 41       | 91       | 91   |
| J S Conlin      | 44    | 46       | 90       | 90   |
| C P Blydenburgh | 45    | 44       | 89       | 89   |
| F H Holton      | 48    | 38       | 86       | 86   |
| O O'Donnell     | 46    | 42       | 88       | 88   |
| F Alder         | 43    | 43       | 87       | 87   |
| H D Blydenburgh | 48    | 38       | 80       | 80   |
| J J Duckworth   | 41    | 34       | 84       | 84   |
| T Lorrillard    | 46    | 37       | 83       | 83   |
| A A Ward        | 38    | 42       | 80       | 80   |
| J H Meeker      | 32    | 93       | 78       | 78   |
| A O Winters     | 39    | 85       | 79       | 79   |
| W W Winters     | 39    | 86       | 78       | 78   |
| W W Winters     | 39    | 86       | 78       | 78   |

Mr. F. H. Holton, with an allowance of 14 points, won the trophy.

YORKVILLE RIFLE CLUB, Jan. 19.—The following are the scores made at the fourth competition for the Paulding match, at Washington Park, 100 yards, Creedmoor rules and targets :

|                             |   |   |   |   |   |   |   |   |   |   |   |   |    |
|-----------------------------|---|---|---|---|---|---|---|---|---|---|---|---|----|
| J R Grohman, Rem Mil.....   | 4 | 4 | 4 | 5 | 4 | 5 | 3 | 4 | 5 | 4 | 5 | 4 | 63 |
| P McMorrow, Rem Sp.....     | 4 | 4 | 5 | 3 | 4 | 4 | 4 | 4 | 4 | 6 | 4 | 3 | 60 |
| O Kelz, Rem Sp.....         | 5 | 4 | 4 | 4 | 4 | 4 | 2 | 4 | 4 | 4 | 4 | 4 | 59 |
| A. S. Brown, Sharps Sp..... | 3 | 4 | 4 | 4 | 4 | 3 | 4 | 3 | 4 | 4 | 5 | 4 |    |

J Paulding, Psa Mar.....3 8 43 3 4 4 6 5 5 5 4-58  
J J Reilly, Win Sp .....4 4 5 3 2 3 2 3 4 4 4 4-52  
G Gee, Win Spo .....4 1 4 3 4 3 4 3 3 3 4 4-50  
W Deane, Rem Sp.....4 1 3 2 3 3 3 3 4 4 4 4-49

This makes Mr. Graham the winner for a second time. A match will be shot every Saturday afternoon hereafter at Washington Park until May 1. A match will be shot every Friday evening 1581 Third avenue. Open to all comers.

Distance 100 feet, five shots, entrance 25 cents.

**New Range.—A New range,** to be called the Morrisania Range, will be opened in the upper part of this city April 1.

**All Comers' Match.**—On Saturday last at Creedmore, 260 Broadway, for a purse of \$100 gold, the following are some of the best scores made:

|                   |   |   |   |   |   |   |   |   |   |   |     |
|-------------------|---|---|---|---|---|---|---|---|---|---|-----|
| W M Farrow .....  | 4 | 5 | 4 | 5 | 5 | 4 | 8 | 4 | 5 | 5 | 5   |
| F H Holt .....    | 4 | 5 | 4 | 5 | 5 | 5 | 5 | 5 | 5 | 5 | 5   |
| B Bockford .....  | 4 | 4 | 4 | 5 | 4 | 5 | 5 | 5 | 4 | 3 | -42 |
| H W Gourley ..... | 4 | 3 | 4 | 5 | 4 | 5 | 5 | 5 | 5 | 5 | -41 |
| A Street .....    | 4 | 5 | 5 | 4 | 5 | 4 | 5 | 4 | 3 | 4 | -41 |
| G L Smith .....   | 3 | 5 | 5 | 4 | 5 | 4 | 5 | 5 | 5 | 5 | -40 |
| W H Sabin .....   | 3 | 5 | 4 | 5 | 5 | 5 | 5 | 5 | 5 | 4 | -39 |

The next contest will take place on Saturday.

EMPIRE RIFLE CLUB.—A new rifle club has been formed, which will continue both short-range and long-range shooting in its matches. Its title is the Empire Rifle Club, given by Mr. Daly, of the firm of Schoverling & Daly, who has presented a gold badge for competition as the first prize. The officers are as follows: President, Leslie C. Bruce; Vice-Presidents, F. H. Holton and W. M. Farrow; Secretary and Treasurer, Dr. M. M. Maltby; Executive Committee, L. C. Bruce, F. H. Holton, C. H. Johr, M. M. Maltby, T. W. Linton, and W. M. Farrow. The first rifle contest will be held at Creedmoor next Spring.

PRIZE FOR PISTOL SHOOTING.—Commodore C. A. Cheever has presented to the N. Y. Rifle Club a prize to be shot for at Conlin's gallery—a beautiful gold scarf-pin, which is an exact model of a Steeven's Target Pistol. The matches with a pistol will be shot on every Thursday evening, commencing to-day.

**NEW JERSEY RIFLE ASSOCIATION.**—A meeting of the Board of Directors of the New Jersey State Rifle Association, which 7th. The question of expediting the bill now before the State Legislature for the purpose of incorporating the association was referred to the following committee: Col. Dudley Steele, Col. E. H. Wright, B. A. Vail, E. A. S. Man, and H. Anderson. The Committee on the Selection of a Range reported. Gov. McClellan will send in a special message in regard to rifle practice.

**HACKENSACK RIFLE ASSOCIATION.**—The annual meeting of this association was held at the above place on Wednesday eve, Jan. 9. Officers were elected for the ensuing year as follows: Pres., James Conklin; Vice-Pres., W. P. Ellery; Treas., A. B. Banta; Sec., Edwin Ackerman; Ex. Com., James Conklin, W. P. Ellery, A. B. Banta, Edwin Ackerman, J. T. Fream, H. L. Bruns. The association is in a flourishing condition, and contains about thirty-two members.

*Mountain View, Jan. 19.*—The following match between Mr. A. H. Boies and H. J. Smith occurred on the rifle range of the Laffin & Rand Powder Co., Mountain View, N. J., Jan. 18, Mr. Smith using a Remington 44 cal. breech-loader and a new brand of powder made specially for long-range shooting by the L. & R. P. Co., Mr. Boies using a 42 cal. muzzle-loading rifle, made by Ferris, of Utica, N. Y., and 70 grains of Orange Ducking No. 8, both powders giving a very even velocity with the least possible residuum.

|                |   |         |   |   |   |   |   |   |   |   |   |   |      |

NEW ORLEANS RIFLE CLUB.—Match for the champion medal, 500 yards, off-hand, standing. This match took place on the 13th, when Mr. C. Kressner won, having made the following fine score with a Sharps mid-range :

|                   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |      |
|-------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|------|
| First score.....  | 3 | 4 | 4 | 3 | 4 | 4 | 5 | 2 | 5 | 5 | 3 | 4 | 5 | 2 | 5-58 |
| Second score..... | 4 | 4 | 3 | 4 | 3 | 5 | 0 | 2 | 4 | 3 | 5 | 5 | 5 | 5 | 5-57 |
| Third score ..... | 4 | 5 | 3 | 5 | 4 | 5 | 4 | 5 | 5 | 3 | 4 | 2 | 5 | 4 | 4-62 |
| Fourth score..... | 4 | 4 | 2 | 3 | 3 | 5 | 5 | 2 | 5 | 3 | 3 | 4 | 4 | 4 | 4-52 |
| Fifth score.....  | 4 | 4 | 4 | 5 | 4 | 4 | 4 | 4 | 5 | 4 | 3 | 4 | 4 | 4 | 4-61 |

The other scores were as follows:

|                      |   |   |   |   |   |   |   |   |   |   |   |   |   |   |      |
|----------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|------|
| Mr Wattenhofer ..... | 5 | 0 | 3 | 4 | 4 | 5 | 2 | 4 | 5 | 4 | 5 | 4 | 3 | 5 | 4-57 |
| Mr M Winteler.....   | 0 | 4 | 4 | 3 | 5 | 4 | 5 | 2 | 4 | 4 | 3 | 4 | 2 | 5 | 3-53 |
| Mr Geo Muller.....   | 5 | 5 | 4 | 5 | 3 | 2 | 5 | 3 | 4 | 0 | 2 | 0 | 4 | 2 | 4-48 |

The Mitchell Rifles, in competition for the Goodwin badge, made the following score at 200 yards:

|                    |   |   |   |   |   |   |   |   |   |      |
|--------------------|---|---|---|---|---|---|---|---|---|------|
| J P Roche.....     | 4 | 3 | 3 | 3 | 4 | 2 | 2 | 4 | 4 | 3-33 |
| Capt M Cooney..... | 4 | 4 | 0 | 2 | 4 | 5 | 3 | 3 | 2 | 2-29 |
| M O'Conner.....    | 0 | 3 | 3 | 3 | 3 | 3 | 0 | 4 | 3 | 3-25 |

FROGMOOR—CRESCENT CITY RIFLE CLUB.—The sixth competition for the gold badge of the Louisiana Field Artillery team took place on the same day on the grounds of the club, Mr. R. F. Schmutz being the winner, out of a possible 25:

|                 |              |                |              |
|-----------------|--------------|----------------|--------------|
| RF Schmutz..... | 4 3 4 4 4-19 | F Saleane..... | 4 4 4 4 0 16 |

**BREAKING GLASS BALLS WITH A RIFLE.**—Dr. W. F. Carver is matched to accomplish the unprecedented feat of shooting 225 out of 300 glass balls with a rifle.

## THE LONG-RANGE FALLACY.

THE *National Guardsman*, for February, devotes the space of a long leading article to what it styles the "Long-Range Fallacy," and labors with many words and less logic to show that "projectors of ranges in the future will find success and profit in considering the military or short-range shooting first and providing for their accommodation, instead of being carried away by the long-range fallacy." The *National Guardsman* is a specialist, and, carried away by its devotion to a single line of work, loses either the ability or the will to take broad notions of matters and things. In view of what long-range men have done and are doing for the advancement of the sport and science of rifle shooting, to speak of their work as "delusive heresy," "wasteful expenditure," and "extravagant outlay," is certainly emphatic if not very just, and a writer who can so thoroughly fail to see the merits of long-range work is to be excused his ignorance and simplicity when he looks at the small-bore marksmen and "wonders at their dictatorial assurance."

And have they not well earned the right to a modest share of assurance. If Creedmoor is self-supporting, what has made it so but the untiring and zealous labor of a band of long-range shooters? Granted that the bulk of the marksmen who frequent the range are mid-range and short-range shooters using military rifles, is that any sensible reason why the scientific portion of the sport should be left out? Call it "fancy" shooting if you will—show by a grand array of figures that the military fusileers outnumber the small-borers an hundred to one; granted that in the field of battle the small-bore men would be of comparatively little service with their peculiar arms; granted also a dozen other things, equally as irrelevant, but equally specious and plausible, and yet the stern fact must remain, that to attempt to cut off this numerically insignificant minority would be a grievous error on the part of our American rifle managers. Whatever glory, whatever of credit, of life or energy now exists in our shooting record is due to the long-range men. The military men have done nothing as yet, and it ill-becomes them to speak of the glorious achievements of their more scientific fellows as a "fallacy."

The English riflemen have long ago listened to just such smooth-sounding arguments as those which appear in the *National Guardsman*. The Snider men looked upon the users of match rifles as mere idlers, and did not scruple to crowd them off the ranges; but a stinging revenge came in the successive defeats of the Irish, Scotch and British teams and bitter indeed are the protests of John Rigby and other shrewd observers of equal intelligence who see the error of this exclusion, and now, when too late to save the national honor, point out the stumbling block. Not only were the teams defeated, but even the military shooters have suffered in retaining a poor arm, when, had they permitted the long-range experiments to go on, better grades of rifles throughout would have been now in use. In other words, whatever of scientific improvement is to be wrought in the military arm is to be gained through the more accurate, more precise and thorough tests at the longer ranges. America stands to-day ahead in all classes of arms, simply because no restriction, no form of repression has been exercised toward any one class of shooters. If any one expects to see the long-range shooters and the military marksmen numerically equal, they surely betray a most simple-minded hopefulness. Such will never be and never should be the case. The mechanical manipulation of a military arm should be the sport and duty of the masses; but the studious use of a match rifle can hardly rise above the pursuit of a few. But the few lead the many, as the small bulked brain governs the great body. To suppose that the question of the importance of this or that class of rifle shooting is merely one of majorities is so rankly absurd that a plain statement carries its own refutation.

We in this country need all the stimulus that can be given to the general subject, without stopping to argue questions of comparative importance of classes of rifles. Our long-range men have done magnificently well, and when the exclusively military marksmen have shown as brilliant a record, it will be time enough to split hairs of differentiation.

BREECH AND MUZZLE-LOADING  
RIFLES.

JUDGE GILDERSLEEVE ON BREECH-LOADING RIFLES.

We recently wrote to Judge Gildersleeve for an opinion upon the merits of breech vs. muzzle-loaders, and rifles generally, and received the following reply, which we have been permitted to publish. Anything from the pen of Judge Gildersleeve is always of interest, but a letter upon this subject just now is particularly so :

NEW YORK, Jan. 9, 1878.

EDITOR FOREST AND STREAM:

*My Dear Sir*—I have repeatedly been asked my views as to the comparative merits of breech-loading and muzzle-loading long-range rifles, and your letter is only one of many that I am in receipt of on that subject. I cheerfully give you my judgment, which is based upon considerable personal experience with both arms, together with careful observation and inquiry. The particular style of weapon that a man chooses I believe to be largely a matter of fancy; although the experienced marksman is certain to use the rifle with which he believes he can make the best score, no matter whether it has to be loaded from the breech or from the muzzle; whether it shoots with or without recoil; or in what country, or by whom it is manufactured. In my opinion the principal advantage a breech-loader possesses over a muzzle-load-

or is this: After each shot it can be cleaned perfectly, and the marksman can be assured of the thoroughness of his work in cleaning, by an ocular inspection of the inside of the barrel. Although the muzzle-loader can be cleaned between shots, and, by a man with a sensitive touch, perhaps, generally as thoroughly as the breech-loader is cleaned, there will be times, however, when the work of cleaning is imperfectly done. The marksman is aware of this, and since the ocular inspection cannot be had, there is not that assured confidence in the perfection of the weapon, which is absolutely necessary to secure the best results. This alone gives to the breech-loader an advantage, and since we realize that a weapon imperfectly cleaned is likely to do bad shooting the advantage of the breech-loader is apparent. Again, allowing that the breech-loader and the muzzle-loader are each manufactured with equal skill, and are perfect weapons of their respective kinds, I have found from experience and observation that the ignition of the powder by the percussion cap is not as perfect as by the primers ordinarily used in the brass shells.

With the muzzle-loader a "hang-fire" is not unusual, and in wet days I have known the discharge to be effected with difficulty. These obstacles are a heavy handicap in a match, and are never met with when using a breech-loader. I do not wish to be understood to say that they are often met with in using a first-class muzzle-loader; but there is a possibility, at least, that they may occur, and in a match that possibility should, if possible, be eliminated, and the chances of winning increased thereby.

As to rifles, there are several good ones, and I should not like to pronounce the shooting qualities of one to be better than the others. I have used Sharps breech-loaders because I was successful with them from the first, and have always had perfect confidence in their reliability. I have shot in many matches with them, and while I have not been so narrow-minded as to believe I had the only good rifle in the match, I always felt that if I could accomplish my part of the work as perfectly as the rifle would do its part I would be certain of success.

My first experience with a Sharps rifle was in the summer of 1874. I was at Creedmoor practicing at 500 yards with an ordinary .50 calibre breech-loading military rifle, and with very indifferent success. I observed a gentleman on an adjoining target who seemed to be making bull's-eyes most of the time. I walked over to him, congratulated him upon his good shooting, and told him how badly I was doing. He answered, although a stranger: "With as good a gun you could do as well," and further said, "I have fired all I care to, here are three cartridges remaining, and I would be pleased to have you try them." I was glad of the opportunity, and was not long in getting into position. The wind was blowing strong from the left. My new-found friend directed me to hold as near as possible upon the left centre line, and added if I did I would be certain to get a bull's-eye. I held there, and up came the white disc. I soon let off the remaining two in the same place and with the same result. I then began to examine the gun; it was decidedly plain in its appearance, short barrel, open military sights and heavy trigger. My friend said it was a Sharps rifle, and that he bought it from Moore & Sons, New York. I went there at the first opportunity and bought one just like it, for which, I believe, I paid about \$80. Upon trying it at Creedmoor I found my friend was right, and that I could shoot as well as he. It was not long before from nine to a dozen consecutive bull's-eyes at 500 yards was not an unusual circumstance with me, and that too in the prone position without wiping.

This was the second gun of any description that I ever purchased, and although I now have what might be considered a fair collection, this military arm still remains a great favorite, and I never shall part with it. I have used it with great success at nearly every distance from 200 to 1,000 yards, and always with satisfaction. With it I have shot game of many kinds, and on one occasion certainly at a remarkable distance. In April, 1877, in the Great South Bay, I killed a broad-bill duck with this rifle at a distance of more than half a mile. At 1,000 yards, without wiping and without rising, I have repeatedly fired 10 consecutive shots, making a good score and without a miss.

The making of three consecutive bull's-eyes in 1874, under the circumstances above narrated, gives the only reason for my commencing to use a Sharps rifle. I found the long range match rifles equally satisfactory, and shall continue to use them, until I can find something I believe to be better. I have found—and it was a strong argument to me in favor of the Sharps rifle, because it saved me much time and troublesome labor—that I could rely on the ammunition supplied by the Sharps Rifle Co. I never loaded fifty rounds of rifle ammunition in my life. I never shot a long-range match except with fixed ammunition supplied by the company. I have more than once rested at night while some of my associates were hard at work preparing their ammunition for the next day. I have also been able to participate in matches that they could not, because the ammunition of their own manufacture happened to be exhausted. The ammunition I used in the first match with Ireland I purchased over the counter at a Broadway store. I have found the shells to nicely fit the chambers, and do not remember that I ever had one so tight after firing that the ejector did not throw it out.

This letter has reached an unexpected length, which must be attributed to the subject under consideration. It is a theme which brings to my mind many bright days full of pleasant incidents. I see before me the faces of many gentlemen with whom I have had most agreeable relations in connection with rifle matters; in short, the theme brings up a panorama of the past upon which I love to dwell, and, undecided what line of thought to follow, I am prone to wander, and, I fear, have failed herein to either instruct or entertain.

But such views and conclusions on rifles as the foregoing is found to contain I subscribe to most heartily.

Yours very respectfully,

H. A. GILDERSLLEEVE.

## RECOIL AND UPSET OF BULLETS.

UTICA, January 7, 1878.

EDITOR FOREST AND STREAM:

In your issue of December 27 I noticed an able article from "Straight-bore" on the recoil of rifles, in which I concur. I have tried many experiments, which proved that the recoil of a rifle did not take place until the bullet leaves the muzzle.

The force is collected within the barrel of the gun, independent

of any outside body, and without any great tendency to move until the bullet leaves the muzzle and comes in contact with compressed external air that is forced from the gun. It would appear that the compressed air within the gun at the muzzle, coming in contact with the external air, would have a tendency to move the gun before the bullet left it, but in all my experiments I could not detect any movement before the bullet left the muzzle of the gun. I have rested the muzzle of a rifle on a steep incline, and made ten shots at 220 yards, all within  $\frac{1}{4}$ -inch diameter. If the gun had moved one-hundredth of an inch, it would have caused the bullet to drop four inches in the above distance.

The same force is generated in a light gun as in a heavy one. The light one has dead weight enough for the powder to exert the most of its power before the gun moves. The heavy one only gets a little additional force by holding its position longer, until the latter portion of gas escapes.

It is evident that we could not do such fine shooting if the gun moved before the bullet left the muzzle.

In my article of the 29th, I stated that a column of air was packed within the gun at the muzzle (when too quick powder was used) that diminished the power.

I should also have stated that we knew of such resistance twenty-five years ago, and regulated the grade of powder, according to the size of bore, and length of gun, so as to get the least resistance from compressed air.

I will here state that I do not agree with "Straight-bore" that the air within or without the barrel has anything to do with the upset of the bullet.

There is no resistance of air at the breech of a gun, and there would not be resistance enough to upset a bullet (if it was done with compressed air) until the bullet had moved  $\frac{1}{16}$  the length of the barrel. In such case the Creedmoor bullets (where they do not take the grooves in loading) would have to get all of their spiral motion and centrifugal force within  $\frac{1}{16}$  the length of the barrel.

If a bullet did not take the grooves until it had moved half the length of the barrel, there would not be centrifugal force enough to keep those long Creedmoor bullets *end on* in their flight, which goes to prove that a bullet upsets and takes the grooves on the start, and gets the full centrifugal force that the twist is intended to give. If those Creedmoor bullets did not upset before they had moved one inch or less, the patch would be blown from around them, and they could not hit a barn at 200 yards. A bullet is upset before the whole charge of powder is burned. The amount that is required to upset one in a rifle would upset one in a pistol, and that amount would be about all that would burn in the pistol. A larger amount would burn in the rifle, and give an accelerating power. A great overcharge of powder forms a cushion, and prevents the bullet from upsetting uniformly. A thick wad over the powder will prevent part of the upset. I have tried cork and other materials, but they caused an uneven upset and inaccurate shooting. A thin wad does not make much difference.

A bar of iron could not be upset if an inch thick of soft wood was placed on the end of it for the sledge-hammer to come in contact with.

Guns that are imperfect and liable to leak before the bullet is upset require a wad over the powder. Bullets that get loose in the shells require the same, unless the rifle is made on the old plan of forcing the bullet to the grooves without a patch. An overcharge of powder does not act quite like sand. The sharp particles of sand take hold of the barrel, and form resistance equal to a solid plug screwed into it. If a straight plug of wood is inserted into the butt of a bullet (as in Straight-bore's experiment), it would prevent the upset as far as the plug reached, and nearly all of the metal forward of the plug would react and show upset to the very point of the bullet. It would show a greater enlargement at the forward end of the plug than if the bullet was solid without the plug, because the most of the force behind would act at the forward end of the plug, and cause the centre of gravity much farther forward, and give more upset to the forward end of the bullet. The great blow given to the bullet by the powder upsets it the whole length.

If very quick powder is used, the forward half of the bullet will react and flow into itself, until it takes the form of the bore nearly to the very point of the bullet, which came nearly being the case with the curious bullet shown in the FOREST AND STREAM of January 3, 1878. Where bullets are long and cylindrical the upset is not as great at the butt end, but greater in the middle. The taper-form of a bullet is made to bring the centre of gravity nearer the butt-end, and give a parallel expansion within its bearings.

A very short bullet (that is not fitted to the grooves in loading) will not take the grooves if suitable powder for a longer one is used, although the velocity would be greater, and more liable to upset, if done by compressed air. There are grades of powder that would mash a conical bullet like putty the instant it started, and form it into a cylinder-shaped plug in the form of the bore. Hazard's FFFG would almost do it in a large bore where the bullet was of soft lead. Some of the refined grades of powder would mash a conical bullet into a straight plug. A bullet put down into the gun within ten inches of the breech, and the gun fired with a good charge of powder, will pack a column of air close behind the bullet and make an indentation into the steel 1-50th of an inch deep by 1-16th of an inch long, making a circular groove as if done with a flat-edge cutter.

If the bullet is put down the muzzle only three inches, and the gun fired, the long column of air in the compressed state covers so much more space that the bullet starts before any indentation takes place. Such an experiment would burst a light barrel.

If "Straight-bore" will take some rifle with Creedmoor bullet (that does not fill the grooves in loading), fire a number of bullets from it into snow, then rifle away every other land in the barrel down to within six inches of the breech, fire it again into snow, and compare the bullets with those of the first trial, and he will find them all quite uniform in expansion, and all of them will have the full number of grooves as at the breech of the gun. In the last trial the air is expelled from the barrel by the escape of gas passing the bullet after it has moved six inches, which prevents any chance of upset by compressed air.

Expelling the air as above gives one-fourth more penetration, but less accuracy, in consequence of the dirt being deposited forward of the bullet by the escape of gas.

The curious rifle bullet described in your issue of Jan. 3, 1878, has the appearance of being fired from an old style German rifle, made many years ago. They had many grooves. The bullets were conical, with a straight bearing about a quarter of an inch long. This bullet, found in the deer, must have been a quarter of an inch longer before it was fired, and in form like the above described. Its present form was made by using the quick powder causing it to upset, and take a double length bearing. I have known large bullets to upset more than that. The crooked point was made by its striking some twig that retarded it before it struck the deer. The imprint of paper folds at the base was made by the great blow given by the powder.

All soft conical bullets used with a patch show the full imprint of the threads of the cloth and grains of unburned powder on the base after being fired. This is another proof of the great blow given by the powder to upset a bullet on the start, and the indentations of unburned powder show that the main blow is given before the whole charge is burned.

Geo. H. FERRISS.

MONMOUTH, Warren County, Ill., Jan. 3, 1878.

EDITOR FOREST AND STREAM:

In looking over a recent number of your much valued paper, I discovered a communication from a Mr. Ferris on the "upsetting of bullets," as he calls it, I must say I was struck with the erroneous impression he seems to have, and tries to convey in his letter.

His misapprehension of both the long-range muzzle-loader and the long-range breech-loader seems to me to be most profound, and altogether unaccountable in one who has ever seen or even heard of either. In the best muzzle-loaders the ball is a cone, the base being its largest diameter. The bearing surface, or that part of the ball which is squeezed into the grooves of the barrel, is very small, say 1-16th of an inch. The theory is that that is enough surface to prevent the escape of the gas past the ball, and the minimum amount of friction. With this ball it is necessary to use a starter, so that the ball, when driven home, may stand with its conical point exactly in the centre of the chamber. If it does not the ball will leave the muzzle in the same position, and, of course, will go wild. Mr. F. is altogether mistaken in his statement that the ball is cast so small that it will "almost drop" into the barrel of the gun. It is rammed through the starter, and into the barrel, and is large enough to take the rifles as it is rammed home. Your correspondent is mistaken in his statement that the ball is swaged into the grooves by the force of the discharge behind. The base of the ball is either perfectly flat or slightly oval, and cannot be influenced in that way by the force of the gas upon the surface. The old Minie ball had a hollow base, and the explosion of the charge did spread the ball into the grooves. The Enfield rifle ball had also a hollow base, and a boxwood plug was forced into the opening at the moment of discharge for the same purpose. Both these were rammed down very loosely into the chamber, and were "upset" by the force behind them. But such cannot take place in a ball with a solid or flat base, and is not so intended. Now, as to the breech-loader: Twelve or thirteen years ago I had occasion to try several kinds of them, including the Sharps, the Henry, and the Colt. I found all unreliable in that most important quality—steady accuracy. Several excellent shots would be made, and then would come one or two which could not be accounted for in any way only that the gun or ammunition was imperfect. At that time they were worthless for sporting or target purposes. In a long talk with the late Mr. Sharp (the inventor of the Sharps rifle), he gave me (after admitting the fact as stated) several reasons for it, the principle of which was this, that they all fashioned their bullets after the style then, as now, used in the muzzle-loader—a cone with a small bearing. In many instances the ammunition was not very carefully prepared, the point of the cone not exactly in the centre of the chamber, and a wild shot was the consequence.

Now, all this is changed. They have lengthened the bearing surface of the ball, and grooved it to lessen the friction, so that if the point is not exactly in the centre of the chamber it must right itself when it takes the grooves at the moment of discharge, and no harm is done. The result is that our breech-loading rifles of to-day, for steadiness, accuracy and regularity, are equal to the best muzzle-loaders. Not better in these respects. "Just as good," is high praise when compared with our best American muzzle-loading rifle. With this digression let us go back to Mr. F. He says that Creedmoor was not a contest between muzzle and breech-loaders, as the behavior of the ball is alike in both. It is a most singular statement for any one to make who has ever seen the two instruments. His assertion that the ball is swaged into the grooves in both by the "spreading" of the ball is true in neither case. In neither case is the ball cast small enough to be "almost dropped into the muzzle of the gun." Did he ever try to ram the ball—say of Remington's .50-gauge cartridge—into the muzzle of his .50-gauge gun? I fancy it would make him sweat, particularly one of his long-range balls which is one-sixteenth part in. No! The ball is forced from the wide chamber at the breech into the narrower grooved portion of the barrel, and takes the rifles or is upset, not because it is expanded by the force of the powder, but because it is too large to be driven through without doing so.

VENATOR.

MONMOUTH, Wis., Jan. 8, 1878.

EDITOR FOREST AND STREAM:

I have read some communications in your paper on the recoil of guns and the upset of bullets. Below I give my views on these points briefly, and if the same ideas have already been advanced by others, and published by you, do not publish this letter. The recoil takes place immediately after the bullet has left the rifle, otherwise the aim would be seriously disturbed, and the mark would not be hit. The recoil is caused by the outer air rushing in to fill the vacuum made by the explosion of the powder and exit of the charge. The report is a result of the same cause. The upset of the bullet is from three causes combined, viz.:

1st. The sudden starting of the bullet from a state of inertia.

2d. The friction retarding the ball, and thus in a manner continuing the first cause.

3d. The compressed air in front of the bullet.

However we theorize on these matters we must not overlook the prime factors, powder, fire and man, who is disposed to "kick up a fuss generally."

Yours truly,

J. H. KNAPP.

EDITOR FOREST AND STREAM:

The articles published in your paper are always welcomed by all sportsmen, especially those on rifle shooting and the upset of bullets. They have awakened an interest in, understanding the why and wherefore of the things, and cannot fail to produce a good and lasting result. The remarks in regard to the N. & L. Syracuse muzzle-loading rifle suit me exactly. A little of my own experience will, perhaps, set some one better qualified, to thinking and working. Having two .44 calibre rifles, one a F. & W. Worcester breech-loader, 7½ pounds, and the other a Rigby muzzle-loader, 7½ pounds, with a false muzzle and ball shaper, I have tried the two side by side. The muzzle-loader invariably gives a penetration of 10 deg. greater at 100 yards than the breech, while the upset of the balls is about 1-16th to 1-8th less. The charge used being 50 grains Curtis & Harvey or Laflin & Rand, and 100 grains lead; both balls being swaged and cast with a ½ soft metal and ½ hardened lead. Soon a party of "ours" are to rig a recoil gauge and try what virtue a muzzle-loader can possess over a breech. Would say that both these guns are A1 shooters, and have made remarkably good targets.

Worcester, Jan. 18, 1878.

NED.

THE PROPOSED MATCH

Between Breech-loaders and Muzzle-loaders Rigby and the Sharps Rifle Co.

SHARPS ARMOY, BRIDGEPORT, Conn., }  
December 29, 1877. }

MR. JOHN RIGBY, DUBLIN, IRELAND:

Dear Sir—In response to your letter published in the *Volunteer Service Gazette*, Dec. 8, in which you say: "I am ready to arrange a match at 1,000 yards between two men shooting with muzzle-loaders and two men with American breech-loaders, the latter to clean at their discretion, and the prize to go to the squad making the best score in a given time," we announce to you our desire to meet you in such a match, and, with a view of settling the detail, we send the following conditions for consideration:

1. You to name two men who shall shoot Rigby muzzle-loaders and we will name two men who shall shoot Sharps breech-loaders, each squad to be allowed one or more substitutes who may take the place of a contestant in case of accident or illness.
  2. The rules of the N. R. A. of America that apply to team matches shall govern this, and the rifles used shall also conform in weight and trigger pull to said rules.
  3. Each competitor must continue through the shooting of each day with the rifle begun with, except in case of an accident not pertaining to the system or style of gun used, such as the breaking of a part, etc.; but the sticking of a shell in a breech-loader, or a load that will not discharge in a muzzle-loader and other accidents peculiar to the rifle, will be at the risk of the competitor.
  4. The match to come off during the month of May next, and, to make conditions as nearly equal as to wind and weather, it shall be shot on three days, one day in each of three successive weeks, and to continue one hour on each day. In case of severe storm on any day appointed, that day's shoot may be postponed to another day in same week. The shooting may begin at any hour of the day, but each hour must be completed when begun, except in case of storm that shall render shooting impossible, in which case it may be completed at another hour or on another day. A sufficient number of targets shall be supplied each squad, so that any delay in the marking shall not delay the contestants.
  5. Each squad to select the range on which it will shoot, you to select one or more persons to represent you upon the range selected by our squad (which will be Creedmoor undoubtedly), and we to be likewise represented upon the range used by you.
- The prize, which shall be —, and shall be furnished by the loser, "to go to the squad making the best score in a given time."
- Yours truly,  
THE SHARPS RIFLE CO.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.  
Drum (two species). Family Scia. Trout (black bass), *Centropomus*  
*niger*.  
Kingfish, *Mentidius nebulosus*. Striped Bass, or Rockfish, *Morone*  
*chrysops*.  
Sea Bass, *Sciaenops ocellatus*.  
Sheepshead, *Archosargus probato*.  
*cephalus*.  
Snapper, *Lutjanus caxus*.  
Tailorfish, *Pomatomus saltatrix*.  
Black Bass, *Micropterus salmoides*.  
*M. nigricans*.

FISH IN MARKET.—RETAIL PRICES.—Striped bass, 20 to 25 cents; smelts, 10 to 18; bluefish, 15; frozen salmon, 30; mackerel, 15 to 25; Southern shad, from Newbern, N. C., first in market, \$1; white perch, 15; Spanish mackerel, 30; green turtle, 25; terrapin, \$18 per doz.; frost fish, 8; halibut, 18; haddock, 8; codfish, 6 to 8; blackfish, 15; Newfoundland herring, 6; flounders, 8 to 12½; eels, 18; lobsters, 10; sheepsheads, 25; scallops, \$1.50 per gallon; soft clams, 30 to 60 per 100; whitefish, 18; pickerel, 15; sunfish, 6; yellow perch, 6; salmon trout, 18; black bass, 18; yellow pike, 12 to 15; ciscoes, 12; hard crabs, \$3 per 100.

MASSACHUSETTS.—Medford, Jan. 19.—Fine sport on the Upper Mystic, fishing through the ice for pickerel and black bass. James W. Russell and Mr. Lynms caught, Jan. 16th, in six hours' fishing, respectively fifty-eight and thirty-six pounds. A few bass were taken, the largest weighing two and a half pounds.

MEMOIR.

MASSACHUSETTS.—New Bedford, Jan. 19.—The fishermen have had one week of pond fishing through the ice, and large strings of pickerel and perch were taken.

CONCHA.

MOVEMENTS OF THE FISHING FLEET.—The fishing fleet is on the increase, some 35 vessels being engaged in the Laffave and Georges fishery and about 40 in the Bank fishery. The number of fishing arrivals for the week has been nine, one from Fortune Bay with a cargo of salt herring, four from the Banks with 15,000 lbs. split codfish and 60,000 lbs. fresh halibut, and four from Georges with about 150,000 lbs. round cod and 10,000 lbs. halibut.—Cape Ann Advertiser, Jan. 17.

NEW YORK.—Greenwood Lake, Orange Co., Jan. 14th.—Judging by the numerous instances I have heard your paper quoted as authority by visitors here, FOREST AND STREAM must be very popular with the patrons of Greenwood Lake; and, as most sportsmen and lovers of nature cherish pleasant memories of their summer haunts and places of recreation, I venture sending you a few stray winter notes from a summer resort.

The last of the summer guests have long since departed. The proprietors of the different hotels, taking advantage of the exceptionally fine weather, have already made many of the repairs and improvements usually postponed until spring.

At the "Brandon" House a large, new ice-house has been built, and is now ready for filling.

At the "Windermere" extensive alterations and improvements have been made in the dining-rooms; the parlors enlarged, new water-closets built and connected by covered porches on the first and second floors with the house; a barber-shop annexed to billiard room, and new, covered porch entire length of building. Many other improvements are in contemplation.

At the "Traphagen" the approach to the house has been changed and very much improved, giving more lawn in front. Mr. Jenness has already filled his ice-house, and is the "pioneer" ice man of this season.

At the "Bradner" House, it being a new house, very little has been done or needed in the way of repairs or building.

At the "Harzen" House a new and very pretty boat-house has been built, and additions to the hotel are said to be projected for the spring.

The lake closed on the 7th, and is now firmly frozen over with an average thickness of about seven inches of ice. Several persons have already been fishing through the ice, but so far with poor success. This is supposed to be the close season for all game fish, but some of our fishermen contend that the law does not apply to perch or catfish. "If this is the case legislation is needed, for all fish should be protected during the breeding and spawning season."

The great question of the hour with our hotel men now is the ice crop, and all are prepared to fill their houses as soon as a "cold snap" occurs.

"GREENWOOD."

—The New Jersey *Mirror* says that the run of codfish off the Jersey coast this year is unusual, and the fishermen around Atlantic City have caught them in such large quantities that the price has been greatly reduced since the beginning of the season. As much as eight tons of the fish have been brought into the Atlantic City inlet in a single day, and while the average price was ten cents a pound it is now from three to five cents a pound at retail.

—Black bass are now one of the most popular fish sold in the Philadelphia market. There is a steady demand for them at remunerative prices.

MARYLAND.—Elkton, Jan. 19.—Catfish in the Northeast River are unusually plenty this season.

FLORIDA.—Lake City, Jan. 14.—There are quite a number of fresh-water lakes near this place, which give to it its name. Fish are quite plenty—bass, bream, and pike. T. B. R.

THE "GREAT WESTERN PISCATORIAL CLUB" was organized at Philadelphia, on the 5th inst., by the election of the following officers: President, Wesley M. Stoner; Vice-Pres., Robert C. Smith; Secretary, John B. Simon; Treasurer, Thomas Russell. The office of Captain and Steward has not been filled as yet.

THE REDFISH OF IDAHO.—We have received from Capt. Chas. Bendire, 1st Cavalry U. S. A., a monograph on the birds of Southeastern Oregon, which is a most valuable addition to ornithology. The gallant captain was engaged in the chase after the Nez Perce Indians. He writes:

"As my ride extended over 3,200 miles of country, I had a chance to see considerable, and I must say that I passed over some most interesting regions, particularly in Northern Idaho. Made the acquaintance of the grayling in Firehole River, Montana, and subsequently in several other places. As far as trout are concerned I won't say anything; the stories to

you, Eastern gentlemen, would sound too fishy. They will have to come out here and see for themselves. I camped at the headquarters of the Redfish, such as are found in the Wallawa Lake, W. T.; but in Payette Lake they are much more plentiful. Unfortunately I passed the latter place a little too early, and none were obtainable at the time I was there, the commencement of July. The latter part of August and the whole of September is the proper time to find them, and a regular fishery is established near the head of the larger Payette Lake where parties make a business to catch and salt them for the market furnished by the mining camps in the vicinity.

SPLIT BAMBOO RODS FOR ENGLAND.—With a leading house like Conroy, Bisset & Malleson, of No. 65 Fulton street, New York, there is no dull season. The process of manufacturing goes on all throughout the year. Split bamboo rods, which beautiful angling implements are the great specialties of this firm, cannot be turned out like buttons. Care must be taken in the selection of the materials, and when the many pieces which make up the rod are brought together in order to glue, or otherwise fasten and bind the bits together, is a process requiring time and precaution. Delicate hand-work cannot be forced; whenever it is, such work is scamped. The demand for spring tackle commences as early as January, and notwithstanding the general ideas of bad times and no money, Messrs. Conroy, Bisset & Malleson are hard at work turning out their tackle to meet the wants of anglers. Coals may not go to Newcastle, still Conroy, Bisset & Malleson are sending all the time their finest split bamboo rods to England, having quite lately filled an order for three of their very choicest rods.

AILANTHUS WORMS FOR GUT LENGTHS.

TORONTO, Jan. 14, 1878.

EDITOR FOREST AND STREAM:

I was much interested in Wm. Gray's article on "Silk-worm Gut" in your last issue, and, without occupying too much of your valuable space, would like to keep up attention to the subject. I was not aware that gut of the length and size that Mr. Gray mentions as having been in his possession had ever been made, but I always thought it was possible to make such gut from some of the larger Bombycids.

Some years ago, my friend Dr. Garlick, then living in Cleveland, gave me some cocoons of the ailanthus silk worm (*Attacus cynthia*, or *corycia*, I think he called it), which he found attached to the rose bushes in his garden, and which I brought home intending to try the experiment of producing silk worm gut from them. From the size of the caterpillar, I was convinced that it was practicable to procure gut of great length and size, such, in fact, as Mr. Gray describes. Unfortunately, I was not at home when the moths emerged from the cocoons, and although I had made suitable arrangements, I did not succeed in hatching any caterpillars; and, even had I done so, I fear I would have had difficulty in getting sufficient proper food for them. I have never, however, given up the idea, and would like to excite sufficient interest in some of your readers living in those localities where ailanthus moths are found, and where suitable food can be obtained, to try the experiment, which, if successful, would not only be a great boon to fishermen, but would also "pay." Dr. Garlick informed me that these moths existed in great numbers around Cleveland, and that the caterpillars fed on the sassafras.

By the way, a singular fact occurred in connexion with the cocoons, which will be interesting to entomologists: One of them did not open the next summer along with the others; it lay all the next year in a drawer along with a lot of odds and ends, and, during the second summer, to my surprise, a moth emerged from it, but its vitality was so feeble that it only lived a few hours. J. H. RICHARDSON.

—Even in Paris they have plumbers, and plumbers have bills, as witness this item from a bill:

To looking for leak in gas pipes..... 2 francs  
To finding the same..... 3 "  
Total..... 5 francs

It is even worse in America, where the plumber not only always has an assistant, but has to lose time while his assistant has gone for the soldering iron or the charcoal.

BOCARDUS' PATENT GLASS BALL TRAP.

The attention of Shooting Clubs and the public generally is called to this trap; it is the only one that gives good practice for wing shooting, as it throws the ball in a manner more closely resembling the flight of a bird than any other trap made. Any man who has never shot a bird on the wing, and will practice from my trap according to rule until he can break two-thirds of the balls he shoots at, can go in the field and secure a good bag of game. The single-trap will throw the balls in any direction or elevation at the option of the puller, as the screen prevents the shooter seeing which way the trap may be set. The Bocardus Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot and thereby insures the breaking of the ball when hit. Buy none but the best, and patronize the man who has spent both time and money to introduce glass ball shooting to the sporting public, until it has become a national pastime. Balls and traps can be ordered through all gun dealers. Balls \$3 per 100; liberal discount to the trade.—[See advertisement.]

### ICE YACHTING.

In response to the request of numerous readers, we republish from our issue of Jan. 27, 1876, the cut of the ice yacht Haze, belonging to Aaron Innis, Esq., of Poughkeepsie, N. Y., and the following description of the dimensions and mode of building an ice yacht of about the size of the Haze, which will give an intelligible idea of their construction:

The body, or boat proper, is made up of three principal parts—the keel or centre timber, and two side timbers. The keel is 21 feet 6 inches long, 3 inches wide and 9 inches deep. The two

ter in the centre, and 2½ inches at the ends. It is fastened aft of the mast by means of an eye and a staple.

The jib-boom is fifteen feet 3 inches long, 2½ inches in diameter at the centre, and 2 inches at the ends, and is fastened to the forward end of the bowsprit.

The gaff is 8 feet 9 inches long, 2 inches in diameter, and has the jaws made to an angle, so that they set square across the mast.

The sails are two in number, the mainsail and the jib. The mainsail has the following dimensions: hoist, 14 feet, 6 inches; foot, 23 feet; head, 8 feet; leach, 23 feet; the lift of the mainsail at the end of the boom is 1 foot 6 inches.

The dimensions of the jib are as follows: hoist, 15 feet; foot, 14½ feet; leach, 22 feet; and it has a lift of one foot. The rigging is of half inch round iron and wire rope.

How to DRAW THE WATER LINES.—In original designs, the midship section is first determined, then the width of the proposed water line is marked on the midship section, and a batten is bent so as to touch the grooves or rabbet in stem and stern deadwood, and take in its curve the point marked in the midship section. The outline of the deck is shaped in a similar manner, and these lines are next transferred from the half-breadth to their respective places on the body plan. Curved lines—to represent the outlines of the cross-section—are drawn so

race. The winner or winners of a junior race may, at the option of the executive committee, be permitted to contest in a senior race, providing application be made immediately after the winning of a junior race. The races each day shall begin at 3 P. M.

First Day.—1, Junior four-oar; 2, Junior double-scut; 3, Six-oared barges; 4, Junior single-scut; 5, Tub race, fifty yards.

Second Day.—1, Senior four-oar; 2, Junior double-scut; 3, Gig race; 4, Senior single-scut; 5, Review by the Commodore; 6, Swimming race, one hundred yards.

Length of course, one mile straightaway and return, for all races.

Time, Wednesday and Thursday, June 19 and 20, 1878.

Resolved, That a piece of plate, to be denominated the "Association Challenge Medal," be awarded to the winner of the senior four-oared and senior single-scut races, to be won at least three consecutive times before becoming the property of the winners;

Resolved, That a special medal be awarded to the winners in each class of the junior races at the regatta in 1878, to become the property of the individuals to whom granted.

Considerable competition arose between Madison, Wis., and Peoria, Ill., each offering inducements for the holding of the regatta. It was finally decided in favor of Peoria. A committee of three was chosen to act with the Peoria Club in the investment of \$600 guaranteed by the Peoria Boat Club for prizes.

Sparkman, F. W. Dawson, A. L. Tobias, Samuel Wragg, J. B. Bisell, J. Legare Walker, R. D. Mure, W. K. Bryan, A. Vanderhorst, J. Anconum Simons, H. B. Bull.

A NEW YEAR'S REGATTA ON LAKE GEORGE.—Quite an unusual event was the single-scut race which came off at Lake George, N. Y., Jan. 1. One year ago the day was celebrated by a trotting race on the ice. This year, over the same course, six stalwart oarsmen pulled their boats, taken for the nonce from their winter quarters. The winner was Mr. Ed Irish, who made the mile in 8m. 45s.

COLUMBIA COLLEGE BALL.—The ball at Delmonico's, Jan 16, for the benefit of the Columbia College crew, was in every way a decided success, creditable to its efficient managers and, in its proceeds, of substantial aid to the boating fund.

—Harvard has challenged Cornell to a freshman eight-oared race of three miles.

MESSRS. TIFFANY & CO., UNION SQUARE, NEW YORK City, have made extensive preparations for the approaching HOLIDAYS.

Their Stock of Diamonds, Watches, Jewelry, Silverware, Bronzes, Pottery, Stationery and Fancy Articles, is the largest and most varied in this country, and includes novelties from abroad and choice goods of their own manufacture, not to be found elsewhere.

A special department has been organized for sending goods to persons at a distance from New York, and any one known to the house, or naming satisfactory references, can have careful selections sent for inspection.

They have lately published a little pamphlet containing a condensed account of each department, and lists of articles appropriate for presents, which they will send to any address on request.

Sole Agents for United States and Canada.

FOR SALE BY DEALERS, GROCERS AND DRUGGISTS.

ICE-YACHT "HAZE."

side timbers are each 2½ inches wide and 4 inches deep. They are joined at the stern to a semi-circle of 15 inches radius, and at the mast by means of a curved plank 12 inches wide, 3 inches deep, and 7 feet ¼ inches long, which is bolted to them.

The runner plank to which the two forward runners are bolted, and which is bolted to the under side of the side timbers and running under the keel, which projects about an inch below the side timbers.

The runners are three in number, two forward and one aft (called the rudder), are made of 2-inch plank, and have steel shoes bolted to them by means of bolts tapped into the shoe and running through the wood, having their heads countersunk therein so as to be flush. The shoes are fastened by ½ inch bolts tapped into them; they are ground on the running edge to an angle of 30 deg., and are 1½ inch deep.

The after-runner, or rudder, is smaller than the forward ones, and is fastened to a rudder-post, which passes through the keel and terminates in a tiller, 2 feet 8 inches long, by which the boat is steered.

The body is planked on the under side with inch boards for a distance of about 7 feet from the after-end.

The mast is 20 feet high, 5 inches in diameter at the foot and 3½ inches at the top, and has a topmast fixed into the top 3 feet long, 2 inches in diameter at the large and 1 inch at the small end.

The bowsprit is 16 feet long, 6 inches deep at the widest part, and 3½ at the ends, and is 3 inches wide on the bottom, beveling to 2 inches on the top. It is fastened to the keel by means of an iron band three-quarters of an inch wide, and also by a bolt running through both.

The boom is 22 feet long, 4½ inches in diam-

as to connect the determined points for deck and load water line with the rabbet of the keel. Intermediate water lines are also drawn on the body plan, and the buttock lines drawn and transferred from the body to the sheer plan. Draw the buttock curves on the sheer plan true curves, and all imperfections shown must be rectified as described in the paper on drawing.

### NAUTICS.

MISSISSIPPI VALLEY AMATEUR ASSOCIATION.—Chicago, Jan. 14.—Editor Forest and Stream.—The Mississippi Valley Amateur Association held their annual meeting in this city on Saturday last. The following members of the Executive Board were present: Pres., J. C. Osgood, Burlington, Iowa; Vice-Pres., J. A. St. John, St. Louis, Mo.; Sec'y, R. G. Thwaites, Madison, Wis.; Commodore, C. L. Williams, St. Paul, Minn.; Treas., F. M. Staples, Chicago; Ensign, P. C. Wheeler, Peoria, Ill.; F. W. Montgomery, Milwaukee, Wis.; and F. W. Gould, Moline, Ill. The following programme on regatta was adopted:

Resolved, That Article VI. of the by-laws be amended by the addition of the following as Section V.:

A junior sculler is one who never won a race in a club or any association regatta.

A junior crew is one in which no member thereof has ever participated in the winning of a shell race in any club or association regatta.

A senior sculler or oarsman is one who has won or participated in the winning of a junior

REGATTA ASSOCIATION OF SOUTH CAROLINA.—The annual meeting of the Regatta Association of South Carolina was held Jan. 12, and I give you report of the same: To Commodore Tupper we are indebted for the prosperous condition of the Association, and there is no one that has taken a livelier interest, or has done so much for the aquatic sports of Charleston, as the Commodore, and his resignation will be keenly felt by the Association. His successor, Mr. Geo. D. Bryan, is a gentleman who has also done a great deal for the Association, and he is certain to keep it up to the present prosperous condition to which Commodore T. has raised it. The appreciation in which the retiring Commodore's efforts were regarded was expressed in a resolution of thanks.

The following officers were then unanimously elected, and the meeting adjourned:

Commodore, George D. Bryan.  
Vice-Commodore, E. H. Frost.  
Rear Commodore, B. H. Rutledge.

Vice-Presidents, Henry Gourdin, Wm. Ravenel, C. O. Witte, C. D. DeSausure, W. L. Trenholm.

Solicitor, Wilmot G. DeSausure; Secretary, Samuel Wragg; Treasurer, T. S. Heyward, Jr.; Assistant Treasurer, J. P. Moodie.

Executive Committee—A. T. Smythe, A. B. Murray, C. H. Glidden, C. B. Holmes, Jr., E. H.

#### HIGHEST HONORS

AT THE  
Centennial World's Fair, 1876!

### SHONINGER ORGANS

#### PRONOUNCED UNANIMOUSLY AS THE Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

There are 50,000 of our instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when turned forward, will make a splendid writing desk, with our Book Closets and Swinging Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few new Agents.

A liberal discount to the Clergy, Sunday Schools, Teachers, Churches and Lodges.

### Sportsman's Gazetteer

AND

### GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM;" AUTHOR OF THE  
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen: It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the *habitat* and breeding season of each—a most valuable contribution to science.

It describes 297 varieties of edible fish alone, that may be taken with the hook; 80 varieties of ducks; 30 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

### "THE OOLOGIST,"

A MONTHLY JOURNAL DEVOTED EXCLUSIVELY TO BIRDS AND BIRDS' EGGS.

This magazine, the favorite of amateur ornithologists, is now in its third volume. It is replete with all that is new or recent in Ornithology and Oology, and publishes important papers on the rarer of our birds and eggs. It is just the periodical for those making collection of birds and eggs for scientific examination, as its columns are constantly furnishing descriptions of the eggs of new and rare species.

Terms—Forty cents a year, in advance. Specimen copies and prospectuses only on receipt of stamp. Address,

S. L. WILLARD & CO.,

Oneida st., Utica, N. Y.

## Gunpowder.

## Warren Powder Mills

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

**SPORTING BRANDS**—Eureka, Continental "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U.S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Beane street, Boston, Mass., and of the agents, **JOHN P. LOVELL & SONS**, corner of Washington, Cornhill and Brattle streets, Boston, Mass., 1719.

## THE

## HAZARD POWDER CO.,

MANUFACTURERS OF

## GUNPOWDER.

## Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

## Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

## Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

## Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. The FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.** GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office, 88 WALL STREET, NEW YORK.

## N.Y. Newspaper Mailing Agency

With the latest improved Newspaper Folding and Mailing Machines, No. 13 Spruce street.  
JAMES BRADY, Manager and Proprietor.

## Sportsmen's Goods.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,  
BOSTON, MASS.

## THE BEST IN USE.

ONLY ONE QUALITY MADE AND THAT IS THE VERY BEST.

Flexible, Waterproof, Tan-Color, Duck.

Each article—coat, trousers, vest and hat—has the name and manufacturers' address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Miserable, drenching rain, pouring down in a perfect deluge, as if a second flood had come upon the earth, two portages to cross, and a swamp between them; that was the prospect before we reached our camping ground. Such a swamp, too; almost impassable, for where the ground was firm was an almost impenetrable thicket of thorns and what not, that looked as if it would tear you to pieces. Well, we got to our camp, and I must confess I was agreeably surprised on my arrival. Although I had been nearly eight hours under incessant rain, laboring and striving along under the adverse circumstances above mentioned, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother-sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of. Ventilation, also, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

**Our Leather Jackets and Vests** are the great wind protectors. They are made from soft, pliable black leather, flannel lined, and sell at \$9 and \$7.

**Our Flexible Tan-Colored Waterproof Leather Coats and Breeches** are considered the finest things ever made. They sell at \$22 and \$15.

An illustrated circular, containing full description of each garment, with sample of the material from which made, will be sent free on application.

Address

G. W. SIMMONS & SON,  
OAK HALL, BOSTON, MASS.

PRICE, BOXED, WITH DARTS, SLUGS, TARGETS, &c., \$10.  
FULL NICKEL PLATE \$12.

**THE NEW IMPROVED AIR RIFLE.**  
Especially Adapted for Target Practice.  
SPLENDID FOR SHOOTING SMALL GAME AND TOUCHING UP CATS OR DOGS.  
Just the thing for Taxidermists to collect specimens. There is no report or danger attending its use, or any auxiliaries required to operate it. It can be loaded with ease and rapidly. It is extremely simple, and has no delicate parts to get out of order or wear out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.  
SEND FOR CIRCULAR. H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.

## Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country. GEO. E. HART & CO., Newark, N. J.  
FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.  
MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.  
Yours truly, A. H. BOGARDUS.

## A VICTORIOUS INVENTION The Eagle Claw.

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.  
The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.  
It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation.  
It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape. It does not mangle or injure its victims in the slightest degree, nor need they be handled to free them from the trap.

## PRICE LIST.

No. 1—For fishing and all kinds of small game and animals, sent by mail..... 35 cents.  
No. 2—For catching Mink, Muskrat, Raccoons, large Game, Fish, etc..... 75 cents.  
No. 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, etc. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight, 14 to 15 lbs. \$10.  
All goods sent, charges paid, to any address on receipt of price. Address

SEND FOR NEW CIRCULAR.

W. H. BAKER &amp; CO., Syracuse, New York.

IRA A. PAINE'S  
FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23.

## THE "STANDARD" BALL.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting, for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known Sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

While other balls are a drug in the market, over 150,000 of the Paine Feather-Filled Balls have been sold in the last month. This is the only ball made to a scale; every one alike. Out of One Million already sold, not one complains. No Fancy Price, but a fair profit.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

Bogardus' Patent Rough Glass Balls  
and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8.

HEADQUARTERS FOR BALLS, HAUGERTY BROS., 10 Platt Street.

FOR TRAPS, GEO. E. HART &amp; CO., Newark, N. J.

Second and enlarged edition of "Field Cover and Trap Shooting," containing instructions for Glass Ball Shooting, will be ready Feb. 1. Price \$2, by mail, postage paid. Address,  
 Capt. A. H. BOGARDUS, International Hotel, N. Y.

## NEW YORK SHOOTING COAT.

A stylish, handsome Coat. First-class in every particular. Pleasant to wear, durable, and in the end the cheapest.

MADE OF BROWN VELVETEEN.

Pockets and lining made to take out, so that it may be worn for early fall and winter shooting. (Horace Smith, Esq., says: "It is my idea of a shooting coat. I have worn them for several years, and would have none other.") Price for Coat, \$25; Vest, \$6.50. Also the best brown corduroy pants at \$10 per pair. make only the one grade, as the cheapest goods do not turn brains and will not give satisfaction.

Also, in addition to the above, I am making a Waterproof Canvas Suit, cut same style as the Velveteen; goods, not stiff and hard, but soft and pleasant to wear; guaranteed to turn water. Sportsmen who have seen it say it is The Best Yet. Coat, \$6.50. For full Suit, \$14.00. I also make the sleeveless Coat; Vest with sleeves if desired. Rules for measurement and samples sent upon application.

For Forest and Stream and Rod and Gun.

## "Perkins' Pilgrimage."

THE twelfth of October—as bright an autumn day as ever came to gladden the heart and quicken the pulse of a lover of nature—saw "Jim Perkins," the writer, and his six years old infant, with three dogs, Hector, Sport and Kate, wending their way to the depot of the Memphis and Charleston Railroad. Dogs and impedimenta aboard, we rolled out for Memphis. On the train we met that prince of sportsmen, Col. Sherrod, of Alabama, en route for the hunting grounds of the Arkansas River. We also met Capt. Keller, one of the finest wing-shots in North Alabama, and a renowned slayer of the *Cercus virginianus*. With them the time was beguiled by much dog and gun talk, the relation of many anecdotes and moving incidents by flood and field.

Although we had a letter from the General Baggage Master saying that "It had long been a custom on this road to pass sportsmen's dogs free," and in face and defiance of a printed order, the baggage master persisted in demanding backsheesh for the dogs. The question naturally arises why is "this thussy?" Have the officers of the road no authority in the matter?

We do not mind paying a baggage-smasher or any other man a fee for taking care of our dogs; but we do most earnestly protest against this system of bare-faced robbery. The printed instructions to officers and employees of the road, read: "Sportsmen's dogs and guns carried free at owner's risk." The most mighty and puissant baggage master says the officers have no right to give any such instructions; and puts in a pitiful whine about "taking bread out of his children's mouths." Will somebody see to it?

We stopped with John Gaston, who knows how to take care of both men and dogs, and we commend him to all sportsmen who pass that way. Next day we met Guido, who, we are glad to state, in the language of the immortal Webster, still lives, notwithstanding the combined attacks of "Dog Whip" and "Neophyte." "Tis true, he is battle-scarred and stained with gore; but his hand is steady, his eyes bright, and his glorious appetite unimpaired, he can still worry down a couple of dozen, raw or fried. My friend, I congratulate thee; when this other Richmond came into the Field I thought thou wert a goner. With Guido we called on the Messrs. Bryson, and were shown Orgill's champion Rush. Any words of commendation from us would be superfluous; he can speak for himself on the show bench. We had the pleasure of meeting the learned and courtly "Jim Davis," who usually gets away with the boys at the trap and in the field. Having seen our friends and made our purchases, we passed the rest of the day lounging in the shade of the elms in the park, feeding the squirrels and listlessly watching the fountain squirt, and, attentively, the pretty girls passing. Our boat was behind time, and we had to wait as patiently as possible. The route was down the Mississippi and up White River to Mount Adams. Sunday we went aboard the boat, and Guido and Mr. Bryson came down to see us off. The former had kindly loaned me his red setter Bryson, son of Rufus, and a first-class chicken dog. The dogs were comfortably provided for on the hurricane deck; then the last box and barrel having been put aboard the bell tapped, and the little Ruth loosed from her moorings steamed slowly out, headed down stream; left the city with its big red-cube-house and battered elevator behind; passed the powder magazines; passed President's island; glided by low shores fringed with feathery cypress and waving willows; and on by sand bars arid as Sahara, now starting a solitary heron, anon a flock of teal. As the sun went down, clouds, bloody red and royal purple, hid him from sight; a long track of light, reflected from the sky, glittered on the river and stretched far away to the other shore. Behind us—broken by the passage of the boat—the tumbling waves glowed with all the changing colors of the sunset.

We were on deck at an early hour next morning, still steaming on in the mighty Mississippi. Far away on a sand-bar a flock of pelicans—at least a hundred—were drawn up in line like a company of soldiers; these we put to flight by a rifle ball ricocheted among them. A little further on we saw the mouth of White River, looking like a spring branch. Though narrow, it is remarkably free from sand bars, snags and sawyers. Turning from the watery highway we took this little by-path, and, steaming ahead, pass the mouth of the Arkansas River, which now discharges the volume of its waters through White River. A low, dreary, deeply inundated, and almost uninhabited country stretches away on either shore. At the mouth of a little bay we saw a white cross marking the grave of "one more unfortunate" gone to his rest. We amused ourselves during the day firing at herons, egrets and ducks; and at nightfall reached Indian Bay, a famous fishing locality. A ducky came aboard with at least a hundred bass and white perch which he offered for a dollar and a half, and they had all been taken within three hours with "cut bait."

At midnight we reached Mount Adams, where we were met by our friends. It made me feel wonderfully at home to see a picture of myself—looking calm and serene—in the parlor.

Next day our friend, Col. Crockett, came over and gave us a hearty welcome. Dear old Bob, many a day, in the times that tried men's souls, have we eaten government mule and hard-tack together. Many a night have we lain down side by side beneath the stars.

The morning was devoted to fixing up, and after dinner we started in a light spring wagon behind a fine pair of mules, with seven dogs racing after us. After a pleasant drive we reached the prairie, and at the first "burn" Byron and Kate began drawing. Mr. Price and Perkins sat on the front seat, the latter gun in hand. Just then some of the other dogs ran in, and up whirled a grouse. "Mark! mark!" Jim cut away, and at the report another arose, giving him as fair a side shot as could be wished, but both whizzed away unharmed; and Jim declared they looked bigger than turkey gobblers.

At dark we reached the ranche. Here Mr. Price has fitted up a comfortable log-room for the accommodation of himself and friends. After a hearty supper we all turned in and slept the sleep of the blessed. At sunrise we were astir, Price and I in the wagon, Col. Crockett, Perkins and Trice on mules. We started in line, the dogs ranging ahead. The level prairie stretched away in front, dotted here and there with small clumps of trees, and enameled at intervals with a "burn," the bright green contrasting beautifully with the dead grass of the prairie.

There was not a breath of air stir. The sun shone gorgeously, and, exhaled by his beams, a thin wreath of vapor like a "filmy veil of misty lawn" hung over the motionless grass. Herds of fat cattle, washed clean by the recent rain, were feeding on the burns, and lent an air of pastoral beauty to the scene. As we moved on Byron and Hector commenced drawing, and soon came down to a stand. The other dogs closed in and backed them. It was a magnificent picture, seven dogs standing on the bright green burn, rigid as if carved in marble, and in attitudes as various as their various colors. Where is the sportsman whose heart would not thrill at the sight of such a picture? But some of the dogs were too eager and ran in, and flushed half a dozen grouse. One came back, and balanced on sailing wings, cleaved the air high above our heads, going like a cannon ball. Perkins turned in his saddle, pitched up his gun. "Too far," yelled Bob. A puff of smoke, a loud report, and the grouse struggled convulsively upward, wavered, then recovered, and flew on a hundred yards, seemingly untouched; then suddenly, as if just stricken, it fell like a stone.

"Hurrah for Jim." "Good shot!" greeted him on all sides. A little further on another covey was stood down. As they rose, Perkins made a good right and left shot, bagging both birds, and Tim knocked down one. The birds were quite wild and many got up out of gunshot. Seeing I would have a better chance with my own dogs, I exchanged my seat in the wagon for a place on deck of a mule. Pretty soon I marked down a small covey, and going up the dogs stood them, Kate standing like an old stager. The "muel" was perfectly steady, and riding up to the dogs, with a *flurr, flurr, flurr*, the birds rose. As two crossed in their flight, I cut away and downed them; the smoke hung in the air, and I could not get in the other barrel until the rest of the covey were nearly out of gunshot. The dead birds were retrieved and we went to where the covey was marked down. Here they lay well, and five more were brought to bag in a few minutes. Thus we shot until a violent rainstorm forced us to beat a retreat to the ranche.

We agreed to try the deer next day, and started early, going west from the ranche. A bright, warm day; the prairie, treeless and vast, stretching in airy undulations far away. We rode fifty yards apart, and had gone two or three miles when pop, pop, pop from the other end of the line—"too far," no venison. Anxious for Perkins to bag a deer, I had exchanged mules with him, and got on one wilder than the wild, wild bucks—and if he was not a buck himself, he certainly was a *brucker*.

All at once, right from under his feet springs a monstrous stag, flaunting his flag and bearing a big rocking-chair on his head; he scuds away through the tall grass at a Ten Broeck lick, nearly frightening the soul from my fearful jug-head. Turning in the saddle, I twisted around until my spinal column had about reached its rotary limit, and fired. Five drachms of powder behind nine "blue whistlers" made a report like a young cannon. Perhaps that animal did not get away from there! And the last I saw of the gallant stag, bearing his branches sturdily, he pitched—head and tail up, venison hams and all—into the timber of Big Island, saluted by a parting shot from Perkins. Riding over the prairie we saw many fresh beds where the deer had recently lain, but the ground was too wet for them. We tried the timber, and some of the party got a shot or two at long range. Emerging from the island, black and threatening clouds were piled up in the west, hiding the sun, and bringing over me a feeling of mysterious dread and nameless apprehension; in antebellum years I had hunted these prairies, and remembered a day—cloudy and dark—when I had been lost, and had ridden for hours before I could find my way to camp. It seemed but yesterday. "*Teu fugaces labuntur anni*!"

"How the winters are drifting like flakes of snow,  
And the summers like buds between."

I recalled the form and feature of each comrade, and all the incidents of the hunt. In the full strength of mature manhood, all but one have passed away—gone now, alas! to the everlasting hunting grounds. But why recall the past? Four

deer bounding over the prairie bring my thoughts suddenly back to the everliving present, and I dig my spurs into Balaam in the vain effort to urge him into a run to head them off from the timber.

Away to the west we see the rain, in long, slanting lines pouring down on the sodden prairie, and "lite out" for camp. But we are soon overtaken by a blinding rain storm. The tall grass pelts us in our faces, and dashes the water into ears and nostrils; and dragged and dreary we plod along in single file, for six weary miles, and thus reach the ranche.

Dumb and drenched we are restored to speech by dry clothing and a smoking supper, forestalled by something hot all round. Gayly the evening passed in song and story; and late at night we spread ourselves to sleep, and soon all hands were bunting phantom bucks in the boundless prairies of mysterious dreamland.

I will not weary you with a further recital of the incidents of the hunt. In the amount of game bagged it was not a success. Each day it rained, and the last I shot ducks from the wagon, as they rose from the prairie, now converted into a sea of water, and we had to strike out for Mount Adams to keep from being cut off by the rising La Goul. But we had lots of fun and met with a whole-souled welcome that did our hearts good. And our pilgrimage will ever be remembered as an oasis in life's desert.

I met those whom I had long loved and from whom I had long been separated. Jim learned to distinguish a grouse from a gobbler and made the leading score. I took on five pounds, honest avoirdupoise, and came home feeling ten years younger.

Our thanks are due, and we hereby tender them, to the Messrs. Price, for their generous hospitality; to Col. Crockett; to friend Tim; to Capt. Harry, of the steamer Ruth, and to Capt. Postal, of the steamer Hard Cash; to the Messrs. Bryson for kind attention; to Wheately, for his many courtesies, and especially, oh! Guido, for thy dog and thy "Injun rubber overcoat;" and last, though not least, to the fair ladies who fixed us that big box of good things—not forgetting the little brown jug—*mille graces*.

We would say, *en passant*, that a most enjoyable voyage might be made in a small steam yacht up White and Little Red rivers. The fishing is good and the trip could be extended inland by a wagon from St. Charles or Mount Adams, affording an opportunity for grouse and deer shooting.

Arkansas is a splendid game and fish country—a land that literally flows with milk and honey. We saw no "peach and honey."

The beef cattle are fine, and the prairie butter beats the oleomargarine a long way.

They have a "rosin weed" on the prairie, the rosin from which is chewed by the Rosalies of the Grand Prairie, and is warranted by me to pull the filling out of your teeth in little less than no time.

It is the wettest country in wet and the driest in dry weather on the footstool. In the way of "productions," we saw a sassafras tree fifteen feet three inches in circumference, five feet from the ground; and a sturgeon five feet nine inches long, with four barbels on the end of his snout, and his mouth below his shirt collar, which is, I believe, fashionable with his branch of the *Ganoid* family.

There was shipped from Mount Adams last year, 1,300 prairie chickens, 100 ducks, 1,120 rabbits and hares, 298 quails, 240 pigeons, 302 squirrels and 99 deer.

We spent a pleasant day at the elegant home of Col. Crockett, where we saw the portrait of his grandfather, the renowned "Davy Crockett." It is not the picture of a rough frontiersman, but has a patrician face, lustrous brown eyes, straight nose, and a fine head. What visions of the fair were conjured up by the sight of that picture; of Travis, of Bonham, of Bowie and of the others, who there made a resistance worthy Leonidas and his Spartans.

We held in our hands the old rifle the hero of the Alamo once used. It is still in perfect repair, and shoots as accurately as when he drew a deadly "bead" through its notched sight; silver-mounted, with curved maple stock and pistol grip. On the barrel is the following inscription, in gold letters: "PRESENTED BY THE YOUNG MEN OF PHILADELPHIA TO THE HON. DAVID CROCKETT, OF TENNESSEE."

Behind the front sight is a gold arrow with the motto—his motto—"Go ahead." In front of the guard is the Goddess of Liberty with the motto, "The constitution and laws." A silver grease box with a coon engraved thereon. A silver deer's head adorns the check piece, and a carved alligator ornaments the guard. On the lock plate a squirrel is engraved, and the maker's name, "Constable, Holyland, New York."

If it had not been Sunday we would have fired a few shots with this curious old rifle.

That night we heard the whistle of the steamer. The farwells were said. We went to the landing, and far up the river a green light and a red one showed high above the water. The regular stroke of the wheel was heard, and the little Hard Cash—looking in the brilliant moonlight like a pile of cotton bales with a couple of smoke stacks sticking out of it—rounded to, landed, and going aboard we commenced our voyage homeward.

At Indian Bay, trolling with a Whitehall spoon half an hour, we caught seven fine bass and one four-pound channel cat being hooked, and the rod handed to the *infant*, he hauled him ashore with mighty exaltation.

The next morning found us in Memphis, and [the next

safely at home. Baring the rain it was one of the most pleasant of the many hunting excursions of my life. And finally, brethren, if the record of it has interested you and killed one dull hour, when you could neither hunt nor ride—

"Not in vain  
We move the sandal-shoon and scallop-shell."

Nov. 1, 1877.

GUYON.

### EAST TENNESSEE.

EDITOR FOREST AND STREAM:

That part of the State of Tennessee included within the Counties of Anderson, Bledsoe, Blount, Bradley, Campbell, Carter, Claiborne, Cocke, Grainger, Greene, Hamblen, Hamilton, Hancock, Hawkins, James, Jefferson, Johnson, Knox, Loudon, Marion, McMinn, Meigs, Monroe, Morgan, Polk, Rhea, Roane, Scott, Sequatchie, Sevier, Sullivan, Union and Washington, is familiarly known as East Tennessee, and lies wholly within the great valley between the Unaka Chain of Mountains on the east and the Elevated Cumberland Plateau on the west. In a recent visit through this part of the State we found much of interest both to the sportsman, stock-raiser, and farmer, and in point of fertility of soil and good climate we were constantly reminded of our old home in Southeastern Pennsylvania. A peculiarity common to this great valley is the way in which its surface is longitudinally fluted by parallel minor valleys and ridges, in which it differs from all other parts of the State.

The whole of East Tennessee is abundantly watered with fine springs and swift running creeks and rivers. In no part of the South is there a finer climate throughout the year than in this section. The country varies from 1,000 to 3,000 feet above the level of the ocean, and some of the mountain peaks of the Unaka range reach the elevation of 6,600 feet. The Watauga, French Broad, Little Tennessee and Hiwassee flow down through this great mountain chain, and along their banks are to be found meadow lands of great richness and fertility, from which very superior hay is harvested. Labor is cheap, as is the case generally throughout the south, ranging from \$3 to \$13 per month. Many of the farms are small, so that the owner is not necessitated to employ much hired help. Stock-raising is a source of much profit in most counties of East Tennessee, and improved breeds of cattle and sheep are being largely introduced since the war. Nearly all kinds of fruit do well, especially apples, peaches and grapes, to which the climate and soil are admirably adapted. Iron, copper and coal abound. Iron of very superior quality is found in Johnson and Carter counties, and the great Duck Town copper mines of Polk County in the extreme southeast part of the State have been profitably worked for a number of years. Many farmers and others from the North have settled in East Tennessee since the war, where they can procure land with fair to good improvements, at from \$10 to \$35, and in a few instances as high as \$75 per acre is asked. Unimproved land includes a great diversity of soil, and prices range from 50 cents to \$6 per acre. The country roads are quite a drawback, as they are mostly poor and badly kept up, except a few of the leading thoroughfares, which are picked or otherwise macadamized. We have seen along the mountain region, contiguous to the French Broad and Nolichucky, frequently, a small steer hitched in the shafts of a small cart, or seen a man astride an ox riding in company with others on horseback. The farmer lives almost entirely within himself, buying, or, to speak more properly, trading at the country store only for calico, coffee, salt and sugar, in exchange for which he gives chickens, eggs, feathers and dried fruit. In the counties of Johnson and Carter bar iron is considered legal tender, being paid out by the many forces to the workmen, and convertible at any of the stores in exchange for shoes, coffee, sugar, and other articles of domestic use. Excellent water power is everywhere abundant, and good sites for mills or factories can be easily obtained. The East Tennessee, Virginia and Georgia Railroad runs from Bristol to Chattanooga, about 235 miles in length, with a branch from Rogersville Junction to Rogersville of sixteen miles, and a branch from Morristown to Wolf Creek, seven miles from Warm Springs, N. C., of thirty-nine miles in length. The latter road will soon be connected through to Statesville, N. C., via Asheville.

SHETTER-BOZNAI.

### Fish Culture.

Abstract of the Annual Report of the Fish Commissioners of the State of Virginia for the Year 1877.

Of the 150,000 speckled trout eggs purchased last fall one-half were sent to the Blacksburg hatchery and the other half to Lexington. Owing to exposure to the severe cold weather only about 30,000 of the Blacksburg lot survived, and these were distributed in the streams in the Southwest. At Lexington the result was better, 65,000 being successfully planted in the streams on both sides of the Blue Ridge.

The efforts of the Commission were also directed to the culture of land-locked salmon, of which 10,000 were procured from Professor Baird, and distributed to all the larger mountain streams.

The cost of trout eggs, and the risk of loss attending their transportation, has led to the preparation of ponds and the gathering of spawners, and Colonel McDonald, to whom this part of the work has been intrusted, is sanguine of success in the undertaking. Dr. M. G. Ellzey has been successful in distributing to the tributaries of the Roanoke and New rivers 30,000 trout spawn, these being a part of 75,000 received in a frozen condition at the Blacksburg hatchery-house.

Notwithstanding the unprecedented scarcity of shad in the Rappahannock River, Mr. R. Greenlaw succeeded in hatching and turning loose in that river about 700,000 fry. In this department of its work the Commission has received very material aid from the proprietors of seines and nets, who, alive to their own interests, have never failed to render all possible assistance. At the Berkeley Hatchery, on the Herring Creek, a mile inland from the James, Messrs. Nicholas and Page succeeded in hatching 200,000 eggs.

In this department the work of the Commission has been much hampered by the absence of proper facilities, more especially of a steam yacht, suitably equipped, such as the Maryland Commission has found so useful. With this it is

confidently believed that 30,000,000 of shad could be hatched annually at Berkeley.

In the fall of 1876 the States quota of California salmon was turned over to the Maryland Commission, who, in return, deposited of young salmon, in the winter of 1876-77, in the Shenandoah, 78,400; in Occoquan, 16,000, and in Goose Creek, 32,000. Besides these, a large portion of the whole hatch was placed in the Potomac, a stream common to the two States. There is no longer any doubt as to the fact that this fish will flourish in Virginian waters, and return by instinct to its home. In May last a fish was caught in the James, nine miles above Richmond, which was undoubtedly a California grise, one of the lot planted in 1874-75, and which had straggled back before its time. Of the large number placed in James River, in the winter of 1875-76, we hear that early in April last several were caught nine to ten inches long, twelve miles above Norfolk. They were said to be moving in solid column, and with great rapidity, oceanward, and only the few that fell out of line were captured in fyke-nets. Regarding their success, therefore, as certain, this fall 100,000 eggs were obtained, which were received at the Lexington Hatchery early in October in first-rate condition, and were hatched out with scarcely a perceptible loss. At this writing the fry are being distributed in the upper waters of the James.

During the spring and fall several lots of southern chub, or pond bass, have been taken to ponds in the interior. The Commission have placed a number of red-eyes in the James, above Richmond, and made unsuccessful attempts to stock all the rivers in the State. Futile attempts were also made to introduce the herring into the James, and it is believed that the culture of this fish, which is commercially more valuable than the shad, might ultimately render the James the foremost herring stream on the Continent.

The black bass have multiplied rapidly in the James, and may now be found in greater or less abundance from Richmond to Clifton Forge.

Several pages of this very interesting report are taken up with a discussion of the acclimatization of sea fish in fresh water, a field for wide observation and inquiry, and suggestive of the possibility of greatly augmenting the number and richness of the fresh-water food fishes; and the list of fishes about Norfolk is here cited from the columns of FOREST AND STREAM as a fair sample of what exists all along the coast.

The difficulty connected with the oyster culture is intelligently discussed in the appendix by Mr. Orvis A. Browne, a gentleman thoroughly conversant with the subject, and the Commission reports favoring the sale of oyster grounds to the proprietors of adjacent lands.

The rest of the report proper is taken up with an entertaining essay by the erudite commissioner, Mr. A. Moseley, on the history and progress of fish culture; some well-timed reflections upon the water-wealth of Virginia; the obstacles to fish propagation; dams; and, finally, under the plea that "a Commissioner of Fisheries is expected not only to do everything with small means, but to know everything relating to fish," the writer gives us a real treat of fish lore, that puts the Virginia report this year at the head of all similar documents, at least so far as literary merits go. Altogether this pamphlet is not an unpleasant contrast to the meagre and wholly statistical papers of the earlier days of fish culture.

FISH CULTURE IN OHIO.—Gov. Young, of Ohio, in his late message, states that Mr. John H. Klippart, Secretary of the State Commission of Fisheries, informs him that many citizens of Ohio have made complaints to the State Commission of Fisheries, to the effect that parties resident of West Virginia and of Kentucky placed seines across the mouths or outlets of Ohio streams near the Ohio side, in the season of the year when migratory fishes are seeking the mouths of streams flowing into the Ohio River, thus preventing migratory fishes from ascending and depositing their spawn to restock said streams with desirable food fishes. Many thousands of fry or young fishes of the salmon and shad families have been deposited in the Muskingum, Scioto and Miami Rivers, by order of the Commissioners, during the past three years. These are well known migratory species, and it is claimed that by the interposition of West Virginians and Kentuckians the mature or adult fish are deprived of free access to the Ohio streams, and the work of the Commission is, to a great extent, rendered nugatory so far as benefiting the State of Ohio is concerned, but that the result of their labors inures to the benefit of West Virginia and Kentucky. It is not charged that the residents of these States have by their conduct violated any law, for it is claimed by them—and the claim has been admitted as valid by the Supreme Court of Ohio in the case of Booth vs. Hubbard, 8 O. S. R., page 243, that the boundary line of the State of Ohio, dividing us from these States, is low water-mark on the Ohio side. The Commission of Fisheries are very confident of their ability to stock our streams with the best food-fishes, provided there are no undue interpositions. Brook trout have been very successfully hatched and introduced into Castalia Springs, near the city of Sandusky. Shad, weighing several pounds, have been taken by lake fishermen in the vicinity of the Bass Islands as well as in the Ohio River; and salmon were taken in the Miami and Maumee rivers, and in the lake. All these were either deposited or hatched under the direction of the Commission. The Governor commended this subject to the people, and suggested that a resolution should be sent to Congress asking to change the eastern and southern boundary of our State so that it will be as follows, viz.: Commencing at the middle of the Ohio River, at low water, at the point where the Pennsylvania State boundary line crosses said Ohio River, thence along the middle of the Ohio River, at low water, to that point of the Great Miami River where it touches or intersects the Indiana State line.

WHY FISH IN PONDS MAY BECOME BLIND.—Rochester, Jan. 23.—Editor Forest and Stream: I wish to caution people owning fish ponds against putting the slats on their screens too far apart, as it is a great cause of blindness to fish. The

slats should be put close enough together so that fish cannot get their heads through as far back as their eyes. If they do they damage their eyes, while working to get through, and become blind. I first discovered this fact by keeping fish in cars made of slats, and have since noticed it in ponds. In the cars none of the fish had their eyes hurt because they were so large that they could not get their heads through between the slats as far back as their eyes.

Yours,

SETH GREEN.

—Mr. Frank Buckland is busy collecting salmon eggs in Scotland, to be sent to New Zealand.

### Natural History.

THE WILD OR PASSENGER PIGEON (*Columba migratoria*).—

Though not ranked among the game birds, this most beautiful creature affords sport and food for man and boy in various sections of the country. Years since it was very abundant in all the States of New England, and when a boy we killed many of them in the woods of Maine and Massachusetts, where they swarmed in incredible numbers, and were easily slaughtered by guns or taken in the nets of fowlers. But of late years they have greatly diminished along the Eastern coast, migrating to the more abundant harvests of the West. We have killed them within a few miles of Boston, where they swarmed in the woods and hovered over the fields when the summer grain had been gathered in, or later, when the winter wheat had been newly sown. They seem to know the exact time for the late sowing, and would suddenly make their appearance at the time when the tender blades first emerge from the soil. At such times within a few years we have found them in September in the western part of the State of New York, where they remained for a couple of weeks, and did not leave until the grain had gained some little growth, and was not easily to be pulled up by the feathered thieves. We used to station ourselves within easy shot of a dead tree at the edge of the wheatfield, and kill numbers of them when they would alight on the bare branches, before they would drop down in the wheatfield. In New England they were shot by the concealed gunner, from a stand consisting of a long pole, elevated at an angle of forty-five degrees, on an upright much resembling the old-fashioned well-sweep. It was usual to bait with grain the ground beneath it, and the flocks would congregate there for food, first alighting on the pole before they settled to the feast. A raking fire was thus afforded to the gunner, and the result was often very destructive. These birds do not seem to follow the line of coast in their passage, but often pass far into the interior. We have but seldom met them on Long Island, or on the Jersey seacoast, and then only in small, detached flocks. They were attracted to the beaches probably by the poke and bay-berries so abundant there. In some years, however, they collect in considerable numbers on Long Island, especially after strong winds from the North have been blowing from Connecticut, across the Sound. Last year there was scarcely a bird to be seen on this part of Long Island; but two years since they were abundant for a few days, and made good sport for the boys. This bird is formed with great strength of wing, and is capable of very prolonged flights. It is said to travel at the rate of a mile in the minute, and it requires a good shot to stop a single bird on the wing. They collect in certain districts in immense numbers, where they remain until the mast and other food is exhausted. Their great rapidity of flight seems to be associated with great acuteness of vision, for while darting over the country with such velocity they still keep up a strict survey for their prey, and instantly cease their flight at the prospect of food, flying low till they alight near an ample supply. They gather in the West in their vast roosting-places in uncounted millions, finding there abundant food, such as grain, pulse, whortle-berries, holly-berries, etc., and the noise of the vast continuous flock, extending for miles, is said to resemble the rolling of thunder. The air is absolutely darkened by the immense flight. These places are chosen in the thickest and tallest of forests, unobstructed by underwood. They collect on the trees in such numbers that their accumulated weight breaks down the branches, and for years the place is made desolate by the destruction. They are hunted and destroyed by hawks and other birds of prey, but their greatest enemy is man. When their roosting-places are discovered the news is wide spread over the country, and multitudes, intent on sport or plunder, collect in all sorts of vehicles, with every variety of weapon to destroy them. They are shot down with guns and beaten down with clubs, and gathered up by thousands on the ground, where they have been precipitated and killed by their own swarming numbers. Nothing is seen or talked of or eaten but wild pigeons. They are barreled up by hundreds and sent off by rail and boat to remote cities, and Washington and Fulton Markets are glutted with them in the season. MCL.

FLORIDA NOTES.—Our friend, Dr. W. K. Lente, writing from Lake George, Fla., gives us some pleasant notes of how they pass the winter down there. He complains, too, and not without reason, that in his "Notes on the Wood Ibis," published in FOREST AND STREAM, of Nov. 29, he was badly treated by our composers, and was made to call some of our Southern birds by new and extraordinary names. Never mind, Doctor, we think we can promise that it shall not occur again. But O, why will not contributors print their Latin. Speaking of the Wood Ibis, our correspondent says:

"In answer to your editorial query as to whether I am sure about the Wood Ibis feeding on aquatic plants, I may state that I am not perfectly sure, as so long a time has elapsed since I collected the birds and took notes. These notes being North, I cannot rectify my statement at present; but when the Wood Ibis returns next spring I will examine their stomachs and report. I am very much interested in the report of quail appearing at sea, and I would like to ask you, Mr. Editor, whether it is not very rare for the little Acadian owl (*Nyctale acadica*) to make sea journeys. During November, '76, my friend Tom W. left New York in a sailing vessel for Florida, and when a day's sail from Sandy Hook, being out of sight of land, he discovered in the rigging of the schooner this little owl. After a long chase, he, aided by the sailors, captured him. The sailors claimed the bird, but told him that if he died he should have him. The owl died, and Tom has the skin in his possession. I thought it very singular at the time for this rather rare bird to be taken at sea. Tom W. also saw a few golden-crowned kinglets and several species of sparrows, which left during the day.

Some time since, while riding over the pine lands, my horse, a rather nervous animal, shied at some object in the grass, and, on looking ahead, I saw a red-shouldered hawk (*Falco lineatus*) fluttering on the ground. I dismounted, and on approaching the hawk found that a common black snake was entwined about the body, wings and neck, and effectually held his hawkish prisoner. I killed the snake, and then captured the hawk after quite a fight. These hawks eat snakes, and I surmised that, failing to get a good hold on the snake, the latter turned the tables by catching the hawk. Then each found he had caught a tartar. The snake had the advantage, though, as the hawk could not move, and I don't know how this battle would have ended had I not appeared on the scene. We have had cold weather and ice for the past three days, but the orange trees in this vicinity are not injured. We celebrated Thanksgiving in a royal manner—a hunt in the morning and afternoon, and such a dinner of roast turkey and broiled venison in the evening, as only tired and hungry hunters can enjoy.

[We presume that the *Nyctale acadica*, of which our correspondent speaks, was not a free agent in the matter. The chances are that he had been blown out to sea, and sought the ship as a resting-place.—Ed.]

**THE BIRDS OF SOUTHEASTERN OREGON.**—One of the most interesting of the recent additions to our ornithological knowledge which we have lately seen is a paper under the above title by Captain Chas. Bendire, U. S. A. The list, which is printed in the proceedings of the Boston Society, includes 191 species, and is based on observations extended over a period of about three years, viz.: from Nov., 1874, to Jan., 1877. The full notes which accompany the present partial review of the birds of Oregon render it especially valuable, and Captain Bendire's investigations into the birds of the region have brought out one or two new points, one of which is the suggestion that we may possibly have two varieties, if not two good species of white pelican, *P. trachyrhynchus*, in the West.

Captain Bendire is so well known to ornithologists as an indefatigable observer, and one of our first oologists, that it is unnecessary to comment at length upon his paper. We commend it to our ornithological friends.

**TWO SIDES TO THE QUESTION.**—Our correspondent, "Sanger," who writes from Elkhart, Indiana, dissents altogether from the views, so often expressed by writers in these columns, in relation to the preponderance of males over females among the ruffed grouse killed. We have already remarked that unless the question of sex has been in all cases determined by dissection, the statements made on this topic are of little value. "Sanger" says:

"A word about the ruffed grouse: Out of more than a hundred killed this season, not over one-third were males. During the early part of the season the sexes (of the killed) ran about equal, but since Nov. 20 there has been a great scarcity of males—not one in ten. On Dec. 20, hunted in my shirt-sleeves it was so warm; I killed a large rattlesnake."

**A RARE BIRD.**—Our friend, Mr. John B. Gilbert, of Penn Yan, N. Y., whose admirable list of the birds of Central New York our readers will remember as having appeared in these columns over a year ago, notifies us of another acquisition to his collection. He tells us that he has just received a young male cormorant (*Graculus dilophus*), killed on Crooked Lake, at Penn Yan, by John Carpenter. It is the first ever killed in that neighborhood so far as known.

**A CURIOUS BAT.**—*Riverside, San Bernardino Co., Cal.*—Editor *Forest and Stream*.—I sent you by to-day's mail a curious specimen of a bat. I send only the head, the other portions of the body being similar to the common kind.

JOHN D. HANDY.

[The bat is *Macrotus waterhousei*, a species found in the West Indies, Florida, Mexico, etc. Its common name is leaf-nosed bat. You will find a full description of it in the report of Lieut. Wheeler's Survey, Zoology, vol. v., p. 80. This admirable work—the mammals by the distinguished zoologists, Drs. Coues and Yarrow, and the birds by Mr. Henshaw—gives a vast deal of interesting information about the animal life of Southern California. We should be very much obliged if you could send us half a dozen complete specimens of this bat.—Ed.]

**ROBIN NESTING UPON THE GROUND.**—In May, 1876, while walking through a roughbroken pasture in Danvers, much overgrown with bushes, my attention was directed to a nest of the robin (*Turdus migratorius*) in an unusual position, by the startled cry of the female as she flew off from the nest. The nest, which was of the normal type, was placed upon the ground at the base of a clump of barberry bushes, in a sheltered position; it contained three eggs. Other instances may be recorded, but I find no mention of them in our standard works upon ornithology.

ARTHUR F. GRAY.

*Danversport, Mass., Jan. 7, 1878.*  
[Robins, as is well known, are very irregular in their choice of a nesting-place. We have found their nests on a joist in a barn, on the capital of the pillars of a piazza, and on the side of a perpendicular ledge of rock, but never on the ground.—Ed.]

**A KING PARTRIDGE.**—A correspondent writes from Poughkeepsie, N. Y., under date of January 21:

In a lot of partridges we had brought to us last fall was one that weighed 2½ lbs. We had it mounted on account of its splendid plumage. From your description in *FOREST AND STREAM* it is a king partridge.

—A Norwalk (Ohio) correspondent sends us in alcohol a specimen, which he thinks a great curiosity, and which he says Mr. S. P. Town, the United States Express Agent at Norwalk, found in a fresh-laid hen's egg, attached to the yolk, and entirely covered by the white of the egg. He wishes to

know what it is. In reply we will say that the specimen promised at first to be puzzling, but a little examination revealed its nature. The egg from which it was taken was a double-yolked one, and what our correspondent sent was simply the second yolk. This second yolk was only partially developed, and the membrane which surrounded it was unusually thick. In fact, as seen by us it resembled the shell membrane rather than the vitelline. This thickening, however, may have been due to its long immersion in alcohol.

## BRANT AND QUAIL IN TEXAS.

FORT CLARK, TEXAS, Jan. 5, 1878.

EDITOR *FOREST AND STREAM*:

Reading to-day your issue of Dec. 27, I see a letter from "P," Galveston, Texas, regarding brant being found near Palestine, Texas, over 100 miles from salt water, though he mentions that he found them in or near a salt lake. It was a new idea to me that brant are not to be found away from salt water. I have frequently found them in large numbers in this section, over 200 miles from salt water, and in pure, clear running water; for instance, I saw several flocks not long ago in the Las Moras River near here. The Mexicans had dammed up the stream for irrigation purposes, causing small ponds to form a few feet deep, and these were full of brant. In the swamp pools were Canada geese, "Mexican" geese and ducks. In Kansas I have also seen them along the line of the K. P. R. R.

Quail are abundant here, and the ground being open prairie covered with thick grass, they afford excellent sport. We have four varieties—the common Bob White; the blue or crested, very similar to the California quail; a speckled or spotted kind, called "Messina" quail, sometimes called "fook's quail," from their habit of squatting on the bare ground and thinking themselves hid; and a fourth variety, called here the black quail. I have been much interested in the attempted introduction of the real Messina quail, and would like to see a description of them.

BUSHWHACKER.

[The "Messina" quail of which "Bushwhacker" speaks is undoubtedly the Massena quail (*Cyrtopsis massena*), while his Blue quail is Gambel's partridge (*Lophortyx gambelli*), and his Black quail is, we presume, the Scaled partridge (*Callipepla squamata*). We have mailed our correspondent a description of the Messina quail, about which so much is now being spoken and written.—Ed.]

## WHAT A CROPPIE IS.

ANAMOSA, IOWA, Jan. 21, 1878.

The "crapple," or "croppie," is a fish I have never seen except in the Mississippi River and its tributaries. They more nearly resemble Kilpatrick's Lake Erie, or grass bass, than any other fish I have ever seen (see Ohio Report for 1877, plate IX., fig. 2). I have no fish before me, and no formula, but, compared with the plate named, I note the following differences: Under jaw not so long or drooping; gill cover not so pointed; scales finer; depth of fish greater in proportion to its length; the swell of the body continuing more nearly to the caudal.

I think them quite valuable for Western waters, particularly so for ponds and sloughs, where the temperature of the water gets very high. I have caught very many in water so warm that I thought no fish could live in it. They are rapidly increasing where they have been planted.

A. H. Franks, a sportsman and fisherman of Waterloo, Iowa, writes me as follows: "Heretofore there has been but very few croppies caught. Last season I have been out several times, when we have caught forty or fifty in two or three hours' fishing, some weighing as much as three pounds."

They are free biters, and will take any bait that a bass will take; and fight well. In my description I should have stated that they are the thinnest in proportion to their size, of any of the *Percidae* family with which I am acquainted. Specimen three inches long, being sometimes nearly transparent in some portions of the body. B. F. SHAW.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FOR THE WEEK ENDING JAN. 23, 1878.—Two Chinese geese (*Anser cygnoides*), presented; two marmosets (*Haplorhina jacchus*), presented; two barn owls (*Strix flammea* var. *Americana*), presented.

ARTHUR E. BROWN, General Superintendent.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

### HOUSE PLANTS.—(Continued.)

**BEGONIAS.**—There are many varieties of flowering Begonias which give great satisfaction as parlor plants, and will repay the careful cultivator, principal among which are *B. saundersonii* with its bright green waxy foliage and crimson flowers, seldom to be caught out of bloom either summer or winter; *B. spathulata*, with rounded shining leaves and pearly white blossoms, a perfect treasure to the careful housewife who has but little time to spend over her pets; *B. fuchsioides*, a rather ticklish variety to manage, but giving beautiful coral fuchsia-like drops in profusion when well grown; *B. nitida*, the lovely large waxy leaves, and immense trusses of light-pink fragrant blossoms of which are a flower garden of themselves; *B. velutina*, with its rich pink blossoms and easy culture, is also one of the very best, as well as *B. manicata* and *B. hydrocotylifolia*, and the hybrid variety raised between them, with their graceful pendant light-pink lace-like flowers, are all reliable and indispensable window plants.

**Pelargoniums.**—The various varieties of *Zonal Pelargoniums*, *Rose*, *Lemon*, *Apple*, *Nutmeg* and other scented Geraniums, are all very desirable for house culture, and the latter sorts are much admired for their beautifully cut and diversified as well as scented foliage. Of the zonal or horse-shoe varieties, both the double and single sorts are desirable, more especially the dwarfier growing sorts of late introduction, and will well repay a little extra care in cultivation. The variegated varieties, with the exception of a few of the more robust silver-edged and bronze sorts do not seem to have constitution enough to stand either our parlors in winter or our parterres in summer.

**Roses.**—I have great hesitation in recommending these most lovely flowers for house culture. Once in a while we see a plant under careful culture well repaying the care lavished on it, but usually their cultivation is but a thankless task, and between insects, over-watering, want of proper light, dry atmosphere and other ills, the rose emerges in spring a most woe-begone looking object. The most easy to manage are *Agrippina*, dark crimson; *Hermosa* and *Duchess d'Abrantes*, light pink; *Safrano*, buff; *Isabella Sprunt* lemon and perhaps *Bon Silene*, bright pink, though we admit we have never seen the latter in good shape anywhere.

Many other flowering plants can be named that we often see do well, as *Cuphea platycentra*, *Epiphyllum truncatum* (many varieties), specially fine when grafted on *Pereskia* or *Cereus triangularis*, *Pittosporum Oranges*, *Lemons*, *Bouvardias*, *Jasminum revolutum* (yellow), and many others, all good when well cared for. *Irises chinensis* is a plant so easy to manage, and withal so beautiful and fragrant, it should be in every collection; *Tropeaeum* in their endless variety of colors; *Maurandias*, and many others which will suggest themselves to the reader, not to speak of the *Tradescantia* or inch plant, known also as *Jacob's Ladder*; the *Lysemachia*, the more wort or *Creeping Charlie*; *Saxifraga samentosa*, the *bestleaf geranium* or *Aaron's beard*; *Madeira vine*, and many other climbers and trailers that, tastefully trained and arranged, make the window garden really a Bower of Beauty and a joy to the possessor. There are many annuals too that can be made to do duty during the winter and spring months, and that will well repay the care needed to bring them into bloom, such as *Nemophila insignis*, *Lobelia*, *Mignonette*, *Sweet alyssum*, *Collinsia*, *Schizanthus* and many others; the *Schizanthus* is but seldom grown, but is easily managed, and is a most showy and attractive plant. It can be sown in August, and naturally forms a perfect candle-brum when grown. *S. pinnatus*, in its many varieties of color, is the best and hardest of all the sorts, and will well repay a little extra trouble and care. One curious fact connected with this plant is, that it is covered with minute glandular hairs, each tipped with a globule of intensely acid matter, so acid indeed that to touch it slightly with the tongue is sufficient to cause quite a sensation. To this circumstance is attributed its perfect immunity from insects, some even asserting that it dissolves and digests them.

This is but a partial list of those flowering plants suited for window culture. As before stated, some seem to have the knack of succeeding with more delicately-organized subjects, but the above list will be found to include nearly all the "old reliables." We have purposely omitted mention of such bulbs as *Hyacinths*, *Tulips*, *Crocuses*, *Narcissus*, etc., which are distinctly winter plants, and known as such, the cultivation of which has been before treated of in these pages; at the same time the list is large enough for selection. We cannot each of us grow all the varieties mentioned, but can choose each for himself those which he finds give most satisfaction, and leisurely experiment with the rest. Next week we will follow with short descriptions of a few of the best plants for the window garden, grown for their foliage alone.

**THE AQUARIUM PIGEON SHOW.**—The exhibition of the Columbarian Society, which closed last week, was notable for an unusually large and fine display of birds, the display ranking with the best ever held in England. Among the classes were fine specimens of pouters, carriers, barbs, short-faced tumblers, owls, trumpeters, fantails, turbits, Jacobins, priests, swallows, Antwerps, nuns, magpies, archangels, ice pigeons, Romans, storks, high flyers, bald heads, shields, beards, starlings, breasters, with other varieties; the whole making a collection of more than eight hundred specimens. A pleasant feature of the exhibition was dispatching the carriers for their homes. Just here the information given in another column regarding the wild pigeon will be found of interest.

—The regular monthly meeting of the New York Horticultural Society will be held on Tuesday, February 5th, at No. 55 West 33d street. Mr. F. M. Hexamer will deliver an address on "Small Fruits for the Family Garden."

### SPLIT BAMBOO RODS

To our customers and the public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age.
2. Food and medicine given.
3. Appearance of the eye; of the coat; of the tongue and lips.
4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc.
5. Breathing, the number of respirations per minute, and whether labored or not.
6. Condition of the bowels and secretions of the kidneys, color, etc.
7. Appetite; regular, variable, etc.
8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg.
9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

### FIXTURES FOR 1878—BENCH SHOWS.

St. Louis Bench Show, St. Louis, Mo., Feb. 19, 20, 21 and 22. Entries close Feb. 5.

Boston Kennel Club Show, Boston, Mass., March 26, 27, 28 and 29. Dr. E. J. Forster, Secretary.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 16, 17, 18 and 19. Dr. W. Seward Webb, Secretary.

For Forest and Stream and Rod and Gun.  
COLORS OF SETTERS AND POINTERS.

SETTERS and pointers may now be seen of nearly all the colors possessed by any breeds of dogs, although the colors of the latter are more restricted in variety than those of the former. For instance, the pure red or white is not uncommon among setters, but among pointers the pure white is rare and the red unknown. Black and liver color are, on the contrary, common to both, and also white, orange, lemon and tan as concomitant colors. There is but one color that is unknown to either of them, and that is the blue; for the so-called "Blue Beltons" are not of a blue color, as might be inferred from the name. I was once actually asked if I had seen any of the "Blue Belton dogs," and "were they really blue?" The nearest approach to this color that I have seen was the coat of a setter bred by myself; that was of a fine purple hue when I last saw it. Both of this dog's parents were of a rich mahogany red, but at eight months of age the pup had an encounter with a dye pot that was filled with indigo blue color. The color was spilled, and after the dog had rolled in it to his heart's content, the blue was so blended with the natural red as to produce a purple. That was certainly a novel and striking color for a dog. We have all heard much of "blue blood," and the dog alluded to has much of it in its veins, but who has seen a blue-coated dog? Turning our attention to the subject of colors, let us first consider one that is alike common to the setter and pointer—the liver color. This on a setter is apt to be regarded as an indication that the dog thus marked is not a high-bred animal; and if, instead of a bright live color, it should be a dull brown, there is a suspicion that the dog may not be even a thoroughbred setter. A well-bred setter, of solid liver color, with a bright, glossy coat, is certainly a handsome dog. But the dull dead brown and white dogs that one so often sees take no rank for beauty, and this is the least desirable marking of all. Liver color is shown to good advantage by the smooth coat of a pointer, for which it is a desirable standard color; but it ranks low as a color for the setter, although ranking highest for its cousin, the retrieving spaniel. For either setter or pointer the solid liver color is more pleasing to the eye, and therefore usually more desirable than any admixture with white, either in equal proportions or with the white predominating.

Black, if it is a jet, glossy black, is a handsome color shown to especial advantage when trimmed with the tan markings characteristic of the Gordon setters. This color is common to both setters and pointers; but solid black dogs of either breed are not very frequently met with. The tan markings that usually accompany this color with setters are not common with pointers, although I once owned a black and white pointer that was marked with tan over the eyes. Black is to be seen in its purity and mixed with other colors, but any admixture of black with other colors than white or tan indicates indiscriminate breeding in respect to color. The legitimate markings with black are, for setters, as follows: First in order of beauty, to my taste at least, is the rich tan color that should be upon the inner parts of the legs, lining of the ears and a spot over each eye; then the black, tan and white named in the order of prevalence, the white forming a handsome marking, particularly when confined to the feet and breast. A preponderance of white is more often seen with the white and black ticked, or white, black and tan ticked. Finally, there is the simple black and white. Occasionally a setter is seen that is ticked nearly as evenly as the Dalmatian, or "coach-dog." This is a marking that I do not prefer, although associated with some of the finest dogs that I have ever shot over. I refer to those that are ticked all over, and not merely on the feet. I have seen a rare mixture of black and white, that was so even in the coat of a setter as to form an iron gray or black roan color.

White, pure and undefiled, is always pleasing, and a well-bred dog is usually tidy. Yet a very little soiling of a coat of this color produces an unpleasant effect. A solid white color is not so common among pointers as with setters, and is not very common with either. White is seen in combination with all the known colors of dogs, and is especially common as a marking of the chest and feet. It is best known as a concomitant color, comparatively few sportsmen preferring it as a predominant color.

Lemon is a well-known color, but one that has never been obtained as a pure, solid color. It ranks high as a marking of white dogs of both the breeds under consideration. The yellow, to which the term lemon is applied in designating the colors of dogs, does not have the decided greenish tint of the fruit itself, but it is a well defined color, quite distinct from orange, the red that is a component of the latter color forming the distinction. Lemon is a particularly fine marking for white pointers, and as such is not outranked by any other, either for beauty, or as an indication of high breeding.

Red is a color that is in much favor, and it is to be seen in a great variety of shades, from the deep blood-red that often merges into black, to the very yellowish shade that might give a mongrel the cognomen of "yaller dog." In choosing a dog of this color avoid extremes. If a dark shade is preferred, let there be no black hairs or black reflections in the coat. If a light shade is preferred, let it be brilliant and uniform. It is strictly a setter color. Occasionally a pointer may be seen whose markings are reddish, and we have seen a pointer of a reddish brindle that suggested the possibility of obtaining a defined red color.

Red is regarded as typical of the Irish setter, and the deep blood red may be justly so considered. Yet red is also a common color among English setters, which develop the beautiful shade known as mahogany red, but seldom of a deeper shade. I do not know that a solid red English setter has ever been produced, although with some the red predominates over the concomitant white. As an instance of red not being typical of the Irish blood, I may mention the dog Guy, owned by my brother, and well-known locally as "the thousand dollar dog." This high-bred dog was out of the thoroughbred red and white English setter Cora, whose portrait adorns the heading of the *Country*. Guy has not a drop of Irish blood in his veins, yet he is of a beautiful mahogany red, that is shown to great advantage by his thoroughly English silky coat.

Although not of a solid red, he has no other body color except the white on the chest. On account of his color he is generally taken for an Irish setter, but such a silky coat and fine feather is not developed by that breed. This dog has been eminently successful in transmitting his characteristics to his progeny. A dog from one litter developed into a perfect fac-simile of its sire in form, color, and markings, as also a pup of another litter out of a different bitch. All of a litter by this Guy, out of my Cora II, were red, some of them very nearly of a solid color, and in them is a happy combination of the beautiful mahogany red, with the silky coat and gentle

disposition of the English breed. A solid red color is not very common, even among thoroughbred Irish dogs. The chest and feet are usually marked with white, which sets off the red to advantage.

A red setter should have dark eyes and a dark nose. Indeed, this is highly desirable for a dog of any color, although a light-colored nose is allowable for white dogs. Dark eyes are universally desirable. However much beauty of coat there might be it would be lost sight of when looking into a pair of yellow eyes. We have seen a liver-colored pointer of very fine points whose whole appearance was marred by whitish-yellow eyes. A dog that would attract the attention of any connoisseur, yet what a shock to a preconceived admiration is experienced when these yellow orbs are turned full upon you. Whitish eyes are detestable in a dog of any color.

Without exhausting the subject let us now consider some of the considerations that govern a sportsman in the choice of color. Of course every one must be governed more or less by his own taste; yet if one has no decided preference for any special color, let other causes than taste or fancy conduce to his decision in choosing.

In any event select a color that shows good breeding. In individual instances color may be no indication of the qualities, good or bad, of dogs; yet, as a rule, it forms a very important element in deciding upon purity of breed, etc. This is notably true of the Gordon and Irish setters. With many sportsmen the choice of color depends in a great degree upon its especial adaptability to usefulness in the field; and if up to the requirements there, no regard is paid to lack of beauty. On this ground the choice differs so much that what one would reject might be the first choice of another.

A sportsman, whose attention was called to the beautiful coat of a red setter, remarked, "Yes, a fine coat, but of a bad color." And this sportsman, desiring a dog solely for use in old fields and wheat stubble, preferred a white dog, that would afford such a contrast with the surroundings as would readily catch the eye. Yet in broom grass the red color would afford the better contrast, and for his own reason white would be there "a bad color." Again, many sportsmen, whose only sport over dogs is in cover, shooting woodcock and ruffed grouse, prefer white dogs because more readily seen. Others, who use their dogs more frequently for snipe shooting, prefer them to be red, because not so readily noticeable by the variety of game that is likely to be encountered. A flock of plovers or ducks at which a shot is desired may be seen approaching, and if at a signal the dogs drop, their color being similar to the surroundings, renders them unobserved, and the sportsman has a shot that would not have been obtained had the dogs been white, black, or any color affording a striking contrast in the landscape. The soiling of coat that is inevitable, especially when snipe shooting, is much more noticeable upon white dogs than upon red ones, and therefore proportionately offensive to the eyes. A black dog offers sufficient contrast of color, if that is desired, for all sorts of ground, whether it be for pinnated grouse ("chickens"), ruffed grouse, partridges, snipe, or woodcock in birch covers. In an older cover a white dog would be most readily seen. I think that the majority of sportsmen prefer for field purposes the color that offers the greatest contrast to that of the ground most shot over. This is owing in no small degree to the fact that their dogs are not well broken, and out of sight means beyond control.

When a dog ranges a quarter of a mile away from its master, and is purposely deaf to any call, it is, of course, very convenient to be able to see the dog at that distance. But were I so eager to fill the bag as not to spare time to breaking my dogs of faults, I would at least teach them one thing thoroughly, to come to me at once when called, except when standing game. The greatest sport for me is killing game over well-broken dogs, and "the bag" is by no means of first consideration.

The dogs are always of first importance, and they furnish by far the greater proportion of the enjoyment of a day's sport. The shot is only the climax of a pleasure that is to be renewed again and again. "The bag," then, is to me no measure of the amount of pleasure enjoyed. Every true sportsman knows how much more satisfaction is derived from a single brilliant shot than from a dozen others that may be equally successful in contributing to the bag.

I do not wish dogs to range so widely that I know not where they may be. Of course, it is impossible to keep the dogs constantly in view, especially in rank grass or in cover, but in such cases they should be hunted closer than in more open ground, and their whereabouts should be at least approximately known. For thick cover shooting I fasten a bell to each dog (never desiring more than a brace in cover), and use bells of different tones that serve to mark the individuality of the bearers. Thus it matters not to me what colors are worn by the dogs, for I can distinguish each one by sound at a greater distance than would be possible by sight, even were they of a solid white color. When the bells, or one of them, cannot be heard, I call; and if, on repeating the call, there is no response, I know that game has been found. Unlike many sportsmen, I prefer, for many reasons that I will not enter into here, always to finish the game myself and never compel nor allow the dogs to do it. If, however, I use my dogs solely for woodcock shooting I might do otherwise, and I might do otherwise if I could keep such a team of dogs as to have a separate brace for hunting each variety of game that is shot over dogs. In such event I could have red setters and liver-colored pointers for the marshes, white dogs for thick cover, black ones for broom grass, etc. In this indulgence of my preference for red setters, I make no sacrifice of usefulness, but, on the contrary, make a gain in that respect when shooting on the marshes. My experience having been to find other game almost invariably when snipe-shooting, I have usually availed myself of such opportunities for a variety of shots and game. Yet I have known a gentleman who, when snipe-shooting, would shoot at no other game. He was excessively methodical, and when shooting snipe was prepared for no other game. If a duck was flushed within range he would not shoot, because his gun was "loaded for snipe." Yet I have cut down many a duck with No. 9 shot when snipe-shooting. Many years ago, while snipe-shooting over the setter Cora above referred to, the dog came to a stand on the bank of a ditch, and a Canada goose rose and was handsomely cut down by my brother with No. 9 shot.

Very many shots have I had that, I believe, would not have been obtained if the dogs had been white; and, while preferring red as a color for setters on account of its beauty, I find it to be unexcelled in usefulness for all sorts of shooting. In the West and South I do not care to use setters or pointers for snipe-shooting on account of the superabundance of the birds and their habits when found in such numbers, and on account of the prevalence of venomous snakes in the far

South. But in Canada, Nova Scotia and along the Atlantic coast as far as Florida, setters are most desirable, and for many reason, above intimated, the red color is preferable. For general shooting at grouse, partridges and woodcock, I am well pleased with red, and consider it highly preferable for snipe-shooting.

EVERETT SMITH.

### A PIG WITH RABIES.

JEFFERSON, Ohio, Jan. 5, 1878.

EDITOR FOREST AND STREAM:

Dear Sir—In your issue of Dec. 6th, cut from the *San Antonio Express*, an account is given of the death of a boy from the bite of a fox, believed to have been a case of hydrophobia. In the absence of a clear diagnosis of the case your theory of tetanus looks plausible, to say the least of it, and may be accepted as the cause of death in this case. As to foxes having rabies our experience may not be devoid of interest. A. D. 1834, much of northern Ohio was in its primeval state. We let our stock run in the woods. To keep our hogs from straying we fed them a little and furnished them a good bed under shelter near the house. In the fall of 1834 my neighbor was aroused in the night by a commotion among his hogs. With a lantern and club he went out and found a gray fox fighting his pigs. As soon as the man approached, the fox left the pigs, walked boldly up to the man, and was killed with the club. Hearing of the strange conduct of the fox we proceeded to investigate: found one shoat (that would weigh about 100 pounds) with a slight wound about an inch and a half long, midway between the eyes and the end of the nose. The wound looked more like a scratch than a bite. We did not probe it, but apparently it was just deep enough to draw blood. Notwithstanding the assurance that "foxes never run mad," we suggested hydrophobia, and counseled the confinement of the pig, which was followed. In the course of two or three weeks the pig was taken sick, refused food, frothed at the mouth, and went into spasms, constantly snapping at surrounding objects, then falling to the ground would lie in a general tremor. When this passed off he would rise, feebly walk about until seized with another spasm, when he would utter a whining squeal, indicative of great distress, and pass through the different stages above described. The spasms increased in frequency and severity until the pig died. We watched the case with great interest, and diagnosed a well marked and clearly defined case of hydrophobia, superinduced by the bite of a fox. Hence the inference, if not the logical conclusion is, that the particular fox was rabid, but whether spontaneous or by inoculation we have no means of knowing. The idea that the bite of a fox or any other animal could produce rabies when the animal was not rabid is too absurd to require serious notice. By the laceration of veins it might produce tetanus, but could not produce rabies. But did tetanus kill the pig? This disease consists of violent tonic spasms of the voluntary muscles, which may affect the muscles of almost every portion of the body, or it may be confined to the muscles of a single part, like the lower jaw, when the affection receives the name of *trismus*, or to the extensors of the back, causing recurvation, termed *opisthotonos*, or to the front part of the body, causing incurvation (*emprostotonos*), or the muscles of the side, causing lateral curvature (*pleurothnos*). In the case under consideration none of the curvatures was present. His snapping jaws prove there was no *trismus*. The only argument for tetanus is the general tremor. What was it? It is claimed that spontaneous hydrophobia is confined to the canine race. According to Linnaeus, Reynard belongs to the same genus, and we see no reason why he should be exempt.

SEPTUAGENARIAN.

SCUTELLARIA AS A CURE FOR HYDROPHOBIA.—The *New York Sun* this week makes mention of the possible advantages in using scutellaria in cases where persons have been bitten by mad dogs. The authority of Mrs. Crooks is cited, whose sister was bitten by a mad dog, and who was reputed to have suffered no inconveniences after having had strong decoctions of skullcap given to her. Of course there is no reason why scutellaria should not be tried, though we do not think it would be of any practical use. Skullcap has long been known, and was used twenty-five years ago as a supposed cure for hydrophobia. The action of this plant is prophylactic, and it is excellent as a nerve, but beyond this, as far as hydrophobia goes, its employment, we believe, is useless. It is terrible to think that, as yet, there is no cure for hydrophobia. When a person is bitten by a mad dog, cut out the part, then wash with fuming nitric acid, and immunity from the disease becomes quite possible.

HYDROPHOBIA IN CONNECTICUT.—We regret to announce the death of Dr. L. L. Way, in Hartford, on the 25th, from hydrophobia. In several towns in the State the authorities have ordered the muzzling of the dogs for periods varying from sixty to ninety days.

PITTSBURG DOG SHOW, Jan. 23.—The arrangements for the dog show in the City Hall were fairly good, and the animals seemed well cared for. The attendance was much larger than the managers could have expected, at one day some 2,800 people having visited the show. Your correspondent wandered in amazement among remarkable chickens, ducks, geese and pigeons, and had the opportunity of eating some of the turkeys. The dogs, however, mainly interested your representative. It is not, of course, to be expected that the display would equal in number such high collections as have been made in New York, Boston, Baltimore or Philadelphia, still in the ninety odd dogs exhibited there were some fairly choice animals. Blue-blood is getting to exercise its powers in the City of Smoke, and you may look soon to see as fine a class of animals in Western Pennsylvania as in any other part of the country. There is a good admixture of Englishmen in the working population of Pittsburgh, and many of them have brought from the old country their love for dogs.

The following were the prizes, the Sportsman's Association

of Western Pennsylvania heading the list with prizes amounting to \$100, divided up as follows: For the best setter dog, native or imported, \$30; best pointer bitch, native or imported, \$30; best setter bitch, native or imported, \$20; second best pointer bitch, native or imported, \$20. The remaining prizes varied in value from \$5 to \$10.

## WINNERS.

Imported English Setter Dog Class—1st, Belton black white and tan, by Dash, out of Daisy. Also, special for best setter of any breed, Frank Bowen, Elmsworth, Pa.

Native English Setter Class—1st, to Champion Lark, orange and white, owned by P. H. Morris, New York; 2d, to Sport, liver and white ticked, Mat Miller, Port Perry, Pa.; 3d, —, orange and white, Grant Forrester.

Native English Setter Bitch Class—1st, Jess, orange and white, Dr. Daly, of Pittsburg, Pa.; 2d, Floss, orange and white, by Snow, out of Fannie, J. R. Stayton, Pittsburg, Pa.; 3d, Moll, orange and white, owned by George Andrews, Pittsburg, Pa.

Red Irish Dog Class—1st, Frank, owned by Thomas Marshall, Jr., of Allegheny, Pa.; 2d, Don, all red, by Shot, out of Tuo, owned by J. C. Hobaugh, of Greenville, Pa.; no third prize given.

Red Irish Bitch Class—1st, T. M. Marshall, Jr., Allegheny, Pa.; 2d, A. Kramer, Pittsburg, Pa. Special for best setter bitch of any breed divided between Jess, native English, and —, red Irish.

Gordon Dog Class—No prize awarded.

Gordon Setter Bitch Class—1st, —, owned by W. H. Barnes, Allegheny, Pa.

Pointer Dog Class—1st, to Rover, liver, Mr. Tremaine (F. H.), Allegheny City; 2d, to Button, liver and white, out of Fan, by imported Bob, J. J. Snellenburg, New Brighton, Pa.; 3d, —, lemon and white, R. M. Gates, Washington, Pa.

Pointer Bitch Class—1st, to Topsy, black, by Old Philadelphia, out of Nellie, owned by J. J. Snellenburg, New Brighton, Pa.; 2d, liver, by Wm. A. Forse, Johnstown, Pa.; 3d, Rose, liver and white, Dr. Hostetter, Allegheny, Pa.

Native English Setter Puppy Class—1st, Laverack pup Thumper, by Pride of the Border, out of Fairy II, black and white ticked, J. J. Snellenburg, New Brighton, Pa.; 2, —, liver and white, by Belton, out of Magnet, Frank Bowen, Elmsworth, Pa.; 3d, —, lemon and white, by Frank, C. Miller, Pittsburg, Pa.

Red Irish Setter Pups—1st, Bob, by Rufus II, out of Moll III, owned by F. H. Tremaine, Allegheny, Pa.; 2d, to —, T. Ferguson, McDonald, Pa.; 3d, —, R. F. Patterson, Pittsburg, Pa.

Gordoa Setter Pup Class—1st, Nimrod, owned by Edward Browne, Allegheny, Pa.

Pointer Puppy Class—1st, Fisk, liver, by Button, out of Topsy, J. J. Snellenburg, New Brighton, Pa.; 2d, Romp, liver and white, R. M. Gates, Washington, Pa.; 3d, Rapin, liver and white, by Alex, out of Gazelle, J. M. Lytle, Jr., Pittsburg, Pa.

In collies, J. Drake, of Mansfield, Pa., took the prize with Lucy, her puppy also securing an award. W. S. Evans, of Allegheny, was also a winner for sheep dogs. The best greyhound was a slut, the property of John Fawcett. The Beaver Valley Kennel Club, of New Brighton, had quite a good collection of dogs. Your correspondent is indebted to Mr. Gregg, the President, and to Mr. Elben, Secretary, for a good deal of attention.

R. A. H.

ST. LOUIS BENCH SHOW.—Mr. Charles Lincoln, Superintendent of the St. Louis Bench Show, informs us that everything is progressing in the most satisfactory way in St. Louis, and that the prospect is that there will be an excellent show. We learn that Gladstone and Nellie, the field trial performers, will be there, but not for competition. The St. Louis Kennel Club have placed the use of their kennel at the disposal of the committee for any dogs that may arrive before the opening of the show. This kennel is situated two miles from the city limits, and Mr. Whitford will see to the dogs. Mr. Dabney Carr has been appointed manager of the department for the display of sportsmen's goods. Mr. C. B. Whitford will take under his care all dogs that may be sent by express. He will be provided with competent attendants. It should be borne in mind that entries will close on the 5th of February. The association has obtained special rates for exhibitors, and all express companies offer to bring dogs or goods for exhibition at one fare, and return free.

JUDGING AT THE ST. LOUIS BENCH SHOW.—New York, Jan. 28.—*Editor Forest and Stream:* I am glad to see in your last issue a letter from "Fair Play," on the judging at St. Louis. It is a delicate subject, and I wish to make no reflections, but when prizes, such as are proposed at St. Louis, are awarded for the "best setter in the show," "best kennel," etc., it is due to the gentlemen who have presented these handsome prizes that no one should feel but what he had a fair and equal chance. Many of our sportsmen who own native dogs, believe if no change is made in the present programme, that they will be debarred from securing the valuable trophies. I coincide with your correspondent, and hope the committee will decide to have all the judges who have been appointed for the exhibition to be present, judge the classes named, and then the winner will gain a victory worth wearing.

JUSTITIA.

DACHSHUNDE, NOT DACHSHUNDS.—A correspondent is good enough to inform us that we have no right to tack an "s" to Dachshund, when we speak of more than one dog. In German *hund* is singular and *hunde* is the plural. We stand corrected, and trust future kennel clubs will change the English "s" to the German "e," and print dachshund for one dog, and dachshunde for more than one dog.

RUSSIAN SETTERS.—Winchester, Jan. 26.—Will "Amicus Caninum" be kind enough to inform your readers upon what page in "Stonehenge" he finds the quotations which he has made in his article on the Russian setter. I have the London edition of '73, but have been unable to find any such statements. On the contrary, he puts down the Russian setter as a distinct breed, and gives nearly four pages mainly in their favor as superior to the English setter. See page 103 to 107 with illustrations.

E. A. B.

MONTREAL HUNT CLUB.—At a meeting, Jan. 18, Mr. Crawford was re-elected Master and Mr. Hutchins Secretary.

NAME CLAIMED.—Henry H. Mundy, of Newark, N. J., claims the name of Two-Eyed Sancho for his liver and tan setter pup, ten months old, by T. Forman Taylor's One-eyed Sancho, out of Horace Smith's Gypsie, she by Morford's (Shipman's) Joe out of Neldon's Gypsy.

Geo. H. Wild, of Red Bank, N. J., claims the name of Pride of Monmouth for his York-Bess red pup, whelped Aug. 23, '77.

BISMARCK.—O. H. Oertel, of Port Richmond, Staten Island, (Jan. 28, 1878), claims the name of Bismarck for his setter pup. By Champion Joe out of Bess; Champion Joe out of Molly, by Moll; Bess out of Biddy, by Pat.

PUCK AND NELLIE.—Would the owner of these two fine dachshunde, Puck and Nellie, kindly give us his address?

WHELPS.—Newport, R. I., Jan. 24.—Mr. J. N. Howard's Daisy, orange and white, 13 puppies—8 gyms. Daisy was visited by Tom, an Irish setter, a very fine dog of Mr. Howard's.

Messrs. Fisher & Bickerton, of Brooklyn (Jan. 28, 1878), announce that their Gordon setter bitch Border Lily has whelped, Jan. 25, four (4), all bitches, to H. L. Leonard's Gordon dog, Pride of the Frontier.

## Sea and River Fishing.

## FISH IN SEASON IN FEBRUARY.

## SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.  
Drum (two species). Family *Sciaenidae*. Trout (black bass), *Centropomus niger*.  
Kingfish, *Mentidorsus nebulosus*. Striped Bass, or Rockfish, *Roccus lineatus*.  
Sea Bass, *Sciaenops ocellatus*.  
Sheepshead, *Archosargus probatocephalus*. Pomatomus saltatrix.  
Snapper, *Lutjanus caesus*. Black Bass, *Micropterus salmoides*.  
M. nigricans.

FISH IN MARKET.—RETAIL PRICES.—The schooner Mary and Carrie, Capt. Moser, while fishing off Squan, N. J., last Wednesday, caught a shark weighing 300 pounds. An effort was made to bring him in alive for the Aquarium, but he died in coming up the Bay, and was delivered to Blackford, in Fulton Market, and was on exhibition for several days. It was what is known as the mackerel porbeagle, *Lamna punctata*. It measured six feet five inches in length. Fish are scarce and prices high. Striped bass, 20 and 25 cents; smelts, 10 to 15; bluefish, 15; frozen salmon, 35; mackerel, 25; Southern shad, 75; white perch, 15; Spanish mackerel, 35; green turtle, 20; terrapin, \$18 per doz.; halibut, 16 cents; haddock, 6; codfish, 6 to 8; blackfish 12; Newfoundland herring, 6; flounders, 10; sea bass, 15; eels, 18; lobsters, 10; sheepsheads, 25; scallops, \$1.50 per gallon; soft clams, 30 to 60 cents per 100; whitefish 18; pickerel, 15; sunfish, 10; yellow perch, 8; salmon trout, 20; black bass: 15; yellow pike, 12; brook pike, 15; ciscoes, 10; hard crabs, \$2.50 per 100; red snapper, 20 cents.

MASSACHUSETTS.—Medford, Jan. 26.—Success at the pickerel grounds still unabated. Two fine "weighters" were drawn through the ice Wednesday, each weighing five pounds. Smelt fishing is carried on quite extensively here on the ice of the Mystic River. The fish demand good prices at the Boston markets.

## MEMOIR.

KENTUCKY.—Stanford, Jan. 27.—During the spring-like weather of last month a Green River farmer near here took his favorite rod—from which line and hook are never taken till to be replaced by a new fifteen center—from an out-door chimney corner where it can always be found when not in use, and in three hours captured sixty-four black bass, ranging from one-half to four pounds weight. They were all taken from one large pool below a mill dam. Sucker fishing will now be in order as soon as waters have cleared and the banks have dried.

## KENTUCKIAN.

OHIO.—Wilmington, Jan. 21.—Several nice strings of bass have been caught in our small streams recently; one fish, 22 inches long, weighing 5 lbs., which is large for our creek or jumping bass. Hastily and truly yours, "POSTED."

HOW AN OLD "SALAR" GOT SALTED; OR, A TRUE STORY VERIFIED.—Our friend Charlie Imbrie (of the firm of Abbey & Imbrie) was currently reported last summer as having outdone all his former exploits in the taking of salmon on his river in Canada. Rumor attributed some small part of his success to his recently invented flies, which he has dubbed the "gipseys" and the "witch." Last week substantial testimony—some solid proof of current quasi fish stories—was brought to us by a messenger in the shape of a fine large salmon salted by such a method that by proper freshening and cooking, it came upon the table equal to a fish fresh from his native river. We were not informed what style of hook captured this salmon, whether it was "witch" or "tother," but it makes no difference now either to us or the fish. Our thanks are due, all the same, for the toothsome gift.

## BAITS FOR BASS.

## EDITOR FOREST AND STREAM:

Without wishing to be considered as coming in the way of my friend, "P. M.," your Richmond correspondent, I beg to give, in as brief a paragraph as possible, my experience in regard to bait for bass fishing. I have read with much interest all that "Splasher" has said on the subject, and, more recently, have seen very interesting extracts from "Glen Falls" fishing note-book of his experience last season.

During the latter part of July last I paid my usual visit to the mountains of Virginia, where I generally spend a brief summer vacation in fishing. My headquarters were at Millboro, but the fishing ground was in Jackson River in the neighborhood of Clifton Forge, one of the most beautiful spots in all the State. The express train leaves Millboro at 5

A. M. and reaches Clifton Forge before sunrise, so I was always on the ground in ample time. I carried with me, besides my tackle, a bucket full of branch minnows, such as are found in the streams thereabout, a supply of worms, grasshoppers and craw fish, small frogs, or toads. I tried some of all of this bait. The minnows, as far as I can now remember, never attracted a bass, but I took many yellow perch with them, known there as yellow blinds. The worms were also a failure, but the craw fish and frogs never failed. The water was too swift for one to use a float, so in place of a stretcher I put on a good stout hook and upon it used a craw fish. Above the stretcher I used a gray fly and above the fly a hook baited with frog. A novel way, it is true, of arranging one's line, but it proved very effective. I never failed to bring home a fair string of bass and fall fish, and sometimes as many as I could carry. The bass would take the frog even after it had been dreadfully mutilated by the fish and been on the hook for an hour. The river bottom is of slate rock and the current generally very swift; at some points, however, there are beautiful eddies, and there I had on several occasions much sport with bass weighing from three to five and a half pounds.

But there is one point more to be attended to and I will not trespass further on your space. During my fishing I used two flies that I had procured in New York from one of your advertisers (J. B. Crook & Co.) for shad. I intended them for shad in the James River Falls here at Richmond, but I was never successful in taking any, so I determined to utilize them, and tried for bass, and they answered admirably. I thought this fact might be of use to some of my brother anglers.

E. H. F.

## Game Bag and Gun.

## GAME IN SEASON IN FEBRUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

## FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Powl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocet, etc., coming under the group *Limicola*, or Shore birds.

RHODE ISLAND.—Newport, Jan. 21.—Very little shooting although weather good for sea fowl. We are to have some live quail distributed on the island this spring. QUANTUM.

RHODE ISLAND.—Newport, Jan. 28.—Two of our sportsmen shot ten out of eleven Wilson snipe a day or two ago.

NEW JERSEY.—Long Branch, Jan. 26.—There are a great many quail kept over this season, and we shall probably have good shooting next year.

E. S. G.

PENNSYLVANIA.—Tyrusville, Jan. 20.—The country here is well adapted to fox hunting, which is a favorite sport. Messrs. Webber, Wheelock and Geochious are successful hunters. Pheasants and squirrels are abundant in season. We hope through the agency of a recently organized game society to prohibit and so increase the supply of game herabouts. Laws have heretofore been little heeded. Our sport here is with pheasants, quails, squirrels, rabbits, a few deer and wild cats.] G. H. W.

TENNESSEE.—Memphis, Jan. 16.—Grassy Lake, 50 miles below Memphis, in Arkansas, and three miles back from the Mississippi, is a famous place for duck shooting. The birds congregate there in vast flocks. Myself and brother in a recent trip there shot 3 deer, 1 bear, 3 wolves, 2 catamounts, 6 wild turkeys, 285 ducks and 6 geese.

T. M. B.

KENTUCKY.—Stanford, Jan. 19.—The crop of quail has been the largest in years. Average shots have found a bag of thirty to fifty easily made on any good day, and a neighboring sportsman, who is the reputed heir to Peter Schlemihl's seven-league boots, has bought one hundred to bag in a day's shooting over an accomplished blue-blood. Two of our boys were out to-day three hours, put up fourteen bevs and bagged thirty whil on a pull between two stations to catch the return train. Our close season will begin last proximo, and nearly every fowling piece has been "rumplumaydized," as "Opodeldoc" expresses "putting in good order," and put away to remain undisturbed till next October, as we have no spring snipe or summer cock shooting—no marshes in the blue grass.

## KENTUCKIAN.

FLORIDA.—St. Augustine, Jan. 20.—The yacht "Seminole," owned by Commodore A. E. Douglass, of the St. A. Y. C., is absent on an expedition to the Halifax river. The party is composed of Messrs. Douglass, Saville and Blanchard, and will spend some weeks shooting and fishing.

OHIO.—Circleville, Jan. 23.—Have had excellent quail shooting the past season. Some duck shooting on our rivers. This game affords most sport in the month of March. G. T.

Wilmington, Jan. 21.—The past season has been the most favorable one in the memory of the eldest inhabitant for the rapid increase of quail in this locality. Weather unusually fine during the breeding season, and many second broods; consequence, multitudes of birds. The shooting season was delightful, and those gentlemen holding white cards with the farmers had an actual surfeit of magnificent sport. Our bags were good for a number of days' shooting—125, 140, 220, 230, 270, 450 and 600. Largest bag in any one day, by one gun, 51, made by Dr. Welch, five hours shooting. During a week's shoot, Mason and Cristy, of Detroit, together bagged nearly 400. One of our Munchausens claims to have killed 1,499, careful record, those on Sundays not scored. Our sportsmen are endeavoring to have our legislators limit the number to be killed by each sportsman to 1,450, so as to prevent their extermination by such prodigies. The stock of birds left over for breeding purposes is simply immense, some farms of 400 acres having no less than ten or fifteen bevs of from ten to twenty birds each; and I am reasonably certain that there is not a small farm in Clinton county without one or more bevs. No snow up to this date, and feed and shelter abundant. If the extremists succeed in passing the law protecting quail for five successive years, the farmers will not grow and gather corn enough to make hominy for their families.

"POSTED."

MICHIGAN.—Muskegon, Jan. 22.—At the annual meeting of the Muskegon County Sportsman Club, the following officers were elected for 1878: Alex. Rodgers, President; E. F. Elmore, Vice-President; Peter Doran, Secretary, and Herman Voss, Treasurer. The club has about thirty members, and there are some good shots among them.

"NATE."

CALIFORNIA.—Wild pigeons are flocking about Napa, furnishing sport ad libitum for the hunter, but proving very destructive to the crops of the farmers.

—Any body wishing wild pigeons may get them by sending to C. Crittenden, Garrettsville, Ohio.

## A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

(POST OFFICE BOX 3332.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 31, 1878.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted for us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

## SCIENCE ON THE QUARTER DECK.

## AN HOUR'S TALK WITH CAPTAIN MORTIMER.

ONE'S conception of what a true student of nature is like may be so very different! The idea of a really good man, at least to our infant mind, was always associated with a white cravat. Alas! later in life we found out that very ungodly people, notably restaurant waiters, sported white cravats. Still, as far as scientific study goes, people seem to think that the devotee must assume a grave and ponderous manner. We are prone to arrange for ourselves the *mise en scene*, and that peculiar weird tinge with which the alchemist imbued all their actions, still predominates our fancies. Now, the question is, in this practical age, why should not men probe into the secrets of nature, casting off their velvets and sables, and in nothing more than their shirt-sleeves, dig into the gist of things? Give an observant man, one whose eyes are always open, a seat on a garden bench, and the leaves and tendrils of the vines which creep over an arbor will afford him ample sources of study. With his foot he turns over a stone, a bit of decayed wood, and under these he finds a hundred objects worthy of examination. If in some of the abstract sciences the solemn privacy of the study is necessary; if apart from all noise and disturbance, a Leverrier eliminated, by pure abstract calculation in his closet, the presence of a planet, for a better acquaintance with nature, such seclusion is as impossible as it is unnecessary. Somehow or other the true naturalist is always a pleasant, a good-natured man. As he must pass most of his time in the open air he generally has that fine, wholesome appearance of sound health which ought to be and mostly is the unflinching evidence of a clear and good head. The physical and mental qualities have combined to give him aid and comfort.

A ship lies moored at the dock on the East River near Fulton Ferry. She is a huge vessel and she has staid there all the summer. Now this good ship, the Hamilton Fish, is getting ready for sea, and bale after bale of cotton is being put below. We climb the gangway, make our way on deck past sailors

and laborers and gain admittance to the spacious cabin. But is it a cabin? It certainly has the appearance of one. Here are the innumerable doors opening to the berths, and there swings that peculiar rack in which the castor, the glasses and the plates are kept, indicative of that time when every object, animate or inanimate on shipboard, has to do its level best to find its own particular centre of gravity. It smells of the ship. There is that peculiar marine-store odor, not bilge water in the least, but of the steward's pantry, where innumerable good things are kept for future use. Still, it is marine, for there is a mast passing through the cabin, and there are ship's charts on the table. But it has more the appearance of a place devoted to study. As the ship sways about gently a door or two gapes open and discloses the contents of the rooms. There are no beds in those berths, but every nook and corner is crowded with books. On the table of the cabin, there are innumerable small vials, kept in their places in boxes, and more than one microscope is in view. Overhead there hang glass globes, in which are growing curious marine plants. Is this then the cabin of a sturdy skipper, or the refuge of some scientific man? It is the domicile of both these useful personages, for Captain John H. Mortimer lives here, who is quite as ready to send his good ship speeding over the wintry waves straight on to Liverpool, by the use of his compass, as he is capable of making some curious discovery in natural history by means of his microscope.

The captain receives us in his honest, hearty and charming way. It is of no use for us to talk. We have not come on board for that purpose, all we wanted to do was to listen and to absorb what we can of the many beautiful and instructive facts which Captain Mortimer can impart to us. It is not a "shiver-my-timbbers" information which is given; there is no tar about it. Like all men thoroughly saturated with their subject there is no redundancy of words, no egotism about Captain Mortimer. The most learned professor, even a Huxley, a Tyndall, might envy the clear, straightforward language Captain Mortimer possesses.

The study of marine creatures and plants has been a labor of love with Captain Mortimer. Drifting about for years in a field tens of thousands of miles in extent, the broad ocean has been Captain Mortimer's text book, and most accurately has he noted all the strange growths which are to be found on her huge, heaving bosom.

A conversation with Captain Mortimer is naturally desultory of its kind. Did you wish it, our naturalist captain could take up any one question and exhaustively get all out of it, and squeeze the subject as dry as a sponge.

We commence, asking a question about the *muriceoides* and the Tyrian purple. Captain Mortimer shows us specimens of the *Purpura lapillus*, which must have furnished the Greeks and Romans with their brilliant purple coloring, which dye was reserved for princes and patricians. We wonder why the Attic dandy did not use aniline colors, and then remember that although Alcibiades was a voluminous speaker and an exquisite they made no gas in Athens. Our naturalist shows us various specimens of the murex, and exhibits many shades of purple derived from this shell. The lasting quality of the color is manifest from the time which has elapsed since Captain Mortimer made the shell-fish exude its pigment. Then, naturally, the ink of the cuttle-fish is talked about, and that curious provision of nature which allows a creature to surround itself with a black cloud in order to escape. Now we discuss rudder fish, and Captain Mortimer gives a simple explanation why the *Carranz carangus* stays in the immediate vicinity of a ship. "It is because," the Captain explains, "the rudder fish follows close in the wake of the ship for safety from dolphins and other marine enemies. Of course the rudder fish picks up some little food from the ship. But when you see rudder fish around you may be sure that there are some big fish after them." The minute one strays away, or lags behind he is gobbled up. The big fish are afraid of the ship, but the little fellows are not." Now we listen to the Captain on those adaptations of nature which she employs so as to best keep herself in a constant state of equilibrium. We hold our peace now, for the Captain is more than eloquent. "There is nothing," says Captain Mortimer, "more beautiful than this incessant action of nature which creates and destroys; life and death are ever being produced in the ocean. Now, take the *Tuca natans*, that's a sea-weed which floats on the water, buoyed up by its seed vesicles which are like corks and net. This sea-weed stays on the surface for a while, when there comes the coral insect. I use the word insect, but it is hardly the proper term. Well, the coral formation seizes hold of those air cells and covers those seed vesicles with the most beautiful traceries of carbonate of lime. Here are several specimens in this little vial. Take this magnifying lens and look at them. See what exquisite lace-work! Now, specific gravity alters circumstances. In time down goes the air vessel, seaweed and all, to be dissolved in the depths below. It has aerated the water, and now it is to furnish new life to others of God's creatures. This same grand rule ever follows. There is nothing that floats on the sea which is not destroyed. The wash of the waves may have incessant action as to abrasion and solution, but this would not be rapid enough. Left alone to their natural action—slow of themselves—we might imagine huge areas of water covered with decomposing seaweed, or drift-wood. Nature wants in such instances to get rid of its useless substances—useless only of course for the moment—and to change them rapidly. Accordingly we have another powerful agent, and that is a worm. What the coral formation cannot sink by overloading, the Tereido finishes by water-logging. A bit of floating wood has but a short life in

salt water. On comes the Tereido and goes through and through a chip or a ship mast, honey-combing it until it is water logged, when it ceases to swim. Here is a Tereido which was some, twenty inches long. It is shriveled up now. It took me years to study out how this worm worked. Now, through your glass, look at his cutting apparatus. It is a very fragile kind of an auger and so delicate that when you touch it it crumbles. How could a poor cutting edge like that go through hard wood? for, mind you, a stick of ebony, any dense or close-grained wood, providing it would float, would be a more toothsome morsel to a Tereido than a bit of white pine. Now, once in the Indian Ocean I was working on a bit of a ship rail which I had picked up at sea, in order to find a lovely lot of Tereidos which had burrowed in it. I wanted one badly as a specimen. As I was carefully whittling my bit of wood I found my hands get clammy and greasy, when I rubbed the track over where the Tereido had passed. I had it then, had the whole story. That worm was both carpenter and chemist. First he exuded some kind of a substance of an alkaline nature which softened the wood, and then the cutting apparatus easily went through the pulp. I am certain I am right, that it is not the cutting portion of the worm which works alone, because stringy, fibrous wood is an impediment to the passage of the Tereido. Though his exudations, or secretions, can soften some parts of the wood, he can't overcome the fibres and the rough fibres hurt his body as he wriggles through. A piece of palmetto wood which is soft in parts and fibrous in others he cannot work on. Now, a knowledge of this kind can be made useful, if not in ships, at least when piles have to be driven into the sea. If we could saturate a log of wood with an acid solution we might neutralize the alkaline substance coming from the worm, and it would prevent the mischief of this Tereido which costs ships and wharf owners millions of dollars every year. But we will dismiss the practical part of all this, for I want to show you my method of preserving certain curious sea forms. Now, look at this." Captain Mortimer showed us a beautiful outline of some strange form which stood out in relief on a long piece of paper. "Now, this is a specimen of the *Salpa pinnati*. It is a kind of ribbon found in the North Atlantic, sometimes many feet long. It is a living organism, a congregate of families all united. It may be the grandfather and grandmother, the sons and daughters, the mother-in-laws and grand children all happily joined together. The great-grand children can break loose if they want to and get independent, and will manage very well, creating new families. Now, I wanted to preserve a specimen, so I dried it gently under pressure, washing out the salt, and there you have it—a perfect salpa less the bulk. Contraction and expansion, the sucking in of the water and the throwing out of the water are the methods of locomotion these salpa have. They are, when alive, beautifully phosphorescent. Now here is something else. I really am proud of having found out a great deal in regard to it. It is the *Littorina bonbyx*. It's a tiny shell fish that really does its own spinning—a kind of sea silk-worm. Now, what does it do that for? Why it throws out its threads and binds together sea-weed, and then deposits its eggs, or germs; makes a nest like a bird. Suppose it didn't? How would the little *Littorina* get along? They would all sink in the sea. What they want is air and warmth in order to grow. So the *Littorina* shoots out her threads backwards and forwards and makes a kind of comfortable quilt for the babies to nestle in. Are not the provisions of nature beautiful? It was years before I got to the bottom of that and a good many learned people doubted it first, but I think they have all now given me credit for it. Here they are." The Captain handed us a bunch of sea-weed and we looked with delight at the delicate filaments, with tiny shells on it. "How many various specimens have you, Captain, on the vessel," we asked. "Oh, I don't know, may be thousands; all these berths are filled with them. It's my museum. Oh, I haven't shown you this. This is the pipe fish, *Syngnathus*. Now, what was queer about this little fish was, that sailing in the North Atlantic I came across quantities of these fish apparently hibernating, sleeping, or torpid on the surface of the water. Now, there is something curious about this pipe fish. Everybody knows—" ("Everybody knows?" we said reflectively, at the same time somewhat inquisitively—"or should know, that it carries its eggs outside." "Like a lobster?" "Yes. Now, how could *Syngnathus* get her eggs matured? I asked myself. Why just in this way, keeping on top of the water, half asleep, if you please, but having the advantages of warmth and heat—No, Mr. Jones, have those bigger balls of cotton stored midships; and see that the stovedores don't neglect their work. As I was saying, often the acts of creatures living on the earth are repeated in the water, only that the destructive actions all become more visible to us in the water than on the land, as we study these forces more carefully."

We could have staid all day listening to Captain Mortimer, so delightful was his talk, so fresh were his illustrations, so attractive were his methods of imparting information. To-day the good ship Hamilton Fish is buffeting the wintry waves on her way to Liverpool. May her clever captain, who is indeed a shining light of science and whose numerous discoveries have entitled him to a leading position in many learned societies at home and abroad, reach his port in safety. It is not common to meet a man who is not only a master in seamanship, but who has found time during a life of labor and hardship to go so deeply into nature's most hidden secrets.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$3; three months, \$1. To clubs of two or more, \$3 per annum.

LA ILUSTRACION VENATORIA.—We beg to acknowledge the receipt of this beautifully illustrated paper, whose editor is Don Jose Gutierrez de la Vega, and place of publication Madrid. The editor of *La Ilustracion Venatoria* is well known as the publisher of a Hunting Bibliography, and as being familiar with all topics relating to sports of the field and stream. The present number contains articles of the most interesting character, which are heightened by capital illustrations. De la Vega is a famous name in the literature of the world, and we are sure that the editor of this paper will not belittle his famous ancestor.

### GAME PROTECTION.

MONTREAL.—The annual report of the Montreal Protective Association, received Jan. 24th, shows that owing to the successful prosecutions of the past there were fewer violations of the game laws during the past season than heretofore.

—The Erie Game and Fish Protective Association have elected the following officers for the ensuing year: Pres., Henry Souther; Vice-Pres., C. M. Tibbals, Jr.; Sec., Clark Olds; Treas., E. P. Gould; Directors, W. W. Reed, chairman; John S. Riddle, John P. Vincent, J. P. Metcalf and W. W. Derby.

—Cecil, Md., is to have a protective club.

PROTECTION IN NEBRASKA.—Omaha, Jan. 21.—*Editor Forest and Stream:* Pinnated grouse and quail have increased very largely over recent years, although the senseless law of last year has been almost totally disregarded in many portions of the State. This law, which was enacted professedly in the interest of the farmers, prohibits the killing of all wild birds, at all times, except water fowls, etc. In this vicinity the infractions of the obnoxious law have been entirely clandestine. No evidence of its violations has been brought to the attention of the Omaha Sportsman's Club, nor have I heard of an instance upon which a prosecution could have been based. No doubt this has been caused by the judicious course pursued by this club, not only discouraging all violations of the law by its own members, but by admonishing all other persons of a determination to prosecute all offenders. Some system of legislation should be devised to prevent the shipping of game to the Eastern markets, and especially in Boston and New York during the close seasons. The main incentive to violations of the law is the traffic abroad—not at home. No contraband game is exhibited for sale in Omaha, because parties know the consequences. But it is this clandestine killing and shipping to Eastern markets in disguise that works the mischief.

BOB WHITE.

### QUAIL PRESERVATION.

WATERTOWN, Wis., Jan. 9, 1878.

EDITOR FOREST AND STREAM:

Here is a way for various sporting clubs to increase the quail in their vicinity:

We have some members of our club residing a few miles in the country, and one, a Mr. Smith Hoyt, about one year since, as the cold weather approached, caught with a trap, nine quails, and put them in his barn. The cats or rats destroyed six of them, but the remaining three he wintered through and turned out in the spring. They took up their abode on his premises, and reared their young; and now Mr. H. has caught them again—thirty-seven this time. "He has constructed a nice little park in a warm place, secure from molestation from cats or other 'varmin's,' where he feeds them daily, and in the spring, will turn them out again without charge for board or rent. They are quite tame and appear to enjoy being fed. Now, let others that are in a situation to do so, follow this example, and we shall soon have plenty of quail again.

S. M. EATON.

[We have printed, from time to time, a good deal on this topic, as its importance deserves, and are glad to call it once more to our readers' attention. This year, unfortunately, live quail are not to be had for love or money in the East, but we hope our Western friends are better situated in this respect.—Ed.]

## The Rifle.

### THE FOREST AND STREAM ROD AND GUN MEDAL.

TEAM SHOOTING BY THE LEADING GERMAN RIFLE CLUBS—THE ZETTLER CLUB WINS.

Desirous of promoting team shooting among our German citizens, the FOREST AND STREAM ROD AND GUN, some six weeks ago, determined to present a handsome prize for the best score to be made by a team of twelve. Though the notice of the match was a short one, our proposal was met with enthusiasm. It may be stated that, in a general way, the various schutzen corps in the United States have rarely, if ever, united in team shooting, and it was with the desire of interesting our many German friends in this particular branch of shooting that our efforts were mainly directed. We had hoped that some of our purely native organizations would have been found ready to measure their skill with our German citizens. We do not like to think that any of our leading American clubs were afraid to meet the teams of the Schutzen associations on their own grounds. We accept, then, the plea that the short notice given of the match did not allow such teams the necessary time for practice. The following were the conditions of the match:

Each team to consist of twelve men, ten shots per man. Shooting, off-hand; distance, 200 yards; any rifle; open to all clubs or associations. No person allowed to compete in a team unless he is an active member of the club for ninety days. Practice from 10 A. M. to 1 P. M. Team shooting to commence at 1 P. M. Targets to be drawn for by each captain of each team. Entrance fee, \$6 for each team. Ring-targets to be used, three-quarter inch rings. After deducting the expenses for the markers, the balance will be divided to the second and third highest teams. Shooting to be governed by the Schutzen Bund rules. Shooting to take place Jan. 23, 1878, at Union Hill Schutzen Park.

Though fairly familiar with the rules and regulations governing the shooting of the Schutzen corps, in order that there should not be any conflict with their approved methods, the management of the match was entirely confided to Mr. John Raschen, who, acting as shooting master, conducted the whole business in the most satisfactory manner, and to whom our thanks are especially due. In fact, the entire method and arrangement of our German friends, in their shooting, is conducted in the plainest and most common-sense manner, and offers many practical advantages which our N. R. A. would do well to look to.

As many of our readers may not fully understand the methods of shooting used by our German friends, we will endeavor to explain them. First, as to rifles: There is no restriction as to weight or make of rifle. The general average of the rifles used in the match was about fourteen pounds. Some rifles weighed eighteen pounds. A hair-trigger is admissible, with any sight save a telescopic one. No artificial rest is permitted. It is off-hand shooting. When the gun is a heavy one, a kind of hand-rest is allowed. This is a wooden adjunct, called a "holder," which is screwed to the gun about four or five inches beyond the guard of the trigger, which is held in the left hand. The left arm is, in this case, sometimes steadied on the hip, and the "holder" held in the palm of the hand and steadied by a firm clutch of the fingers. The charge, generally, was seventy grains of powder, with a small cone-shaped bullet, say of about forty to the pound. A patch is used. False muzzles are employed in inserting the balls, and the rifles are cleaned out after every fourth or fifth shot. The leading makers of these rifles are: Mr. Schalk, of Pottsville, Pa.; Mr. John Rhine, of New York; Mr. Spencer, of Connecticut, and Mr. Zettler, of New York. We may state that quite a number of breech-loaders, principally Ballards, were used.

The targets: The diameter of the target is 23½ inches, the bull's-eye having a diameter of 1½ inches. The whole target is divided up with fifteen rings, which are three-quarters of an inch apart. The black in the target extends through the seventh to the eighth ring, the white from the eighth to the fifteenth. The scoring is made twenty-five for the bull's-eye, each circle diminishing by one point. Some of these days, when rifle shooting at long or short range improves, by the use of more accurate weapons, we shall have to adopt a similar method at Creedmoor. It shades off the value of shots.

In marking the shots at the butts the targets are double, hung in window frames and counterpoised. The shooter at the stand rings a bell, which calls the marker's attention. The target is lowered after the shot, patched, and the other target being run up is ready. The score is shown by means of a black tin plate, with the various numbers painted in white on it. There are special signals as of white, blue and red flags, when the bull's-eye or the circles near it are hit. The markers work under the protection of a solid stone wall higher than their heads. The balls are received in a wooden frame, constructed of soft wood, the timbers being built up at right angles with the plane of the wall, so that the balls bury themselves into the grain of the wood. In this way the balls completely imbed themselves, and there are no splinters.

The 28d was just as cold as it could be, and the wind blew

a gale all day with a force which the meteorological bureau says was phenomenal, sometimes as much as forty-five and fifty miles an hour. But the sun was bright and few clouds shaded the horizon. The shooting hall at the Union Hill Schutzen Park is a large structure, capable of allowing twenty-four men to shoot at the twenty-four targets at a time.

Three sides of the hall are covered in, the fourth, fronting the targets, being of course open. Various screens interpose between the targets and the stand, so that bullets shot more or less wild are arrested in their flight. We suppose that shooting at the wrong target is of rare occurrence. By 1 o'clock, everything being in order, shooting commenced in a most lively way, and the crackings of the rifles were incessant until 4 o'clock. Four men from each team were always in place, so that there was no delay. As it was intensely cold, the pluck and endurance of the marksmen were all the time taxed to their utmost. Still, the excitement carried everything through most pleasantly. The following teams competed: The Zettler Rifle Club, Captain B. Zettler; the Newark Shooting Association, Captain W. Hayes; the Jersey Schutzen Corps, Captain A. Ermich; the New York Schutzen Corps, Captain Aery; the Brooklyn Schutzen Corps, Captain Kohlmeier, and the Independent New York Schutzen Corps, Captain J. J. Diehl. The following was the result:

Our engraving gives a capital conception of the medal presented by us to the teams which shot on Jan. 23, at Union Hill Schutzen Park. The medal is of gold, worked with various shades of the precious metal. In the centre is a white enamel target, divided by gold circles, with a black bull's-eye. A wreath of laurel surrounds the crown. The legend, "Champion Team—Forest and Stream Medal, 1878," is engraved on a scroll. The medal is hung by a gold chain from two miniature German Schutzen rifles, with their peculiar globe sights and curved butt plates. Our numerous German friends have been quite unanimous in regard to the general good taste our artist has evinced in the designing and execution of this trophy.

### For the Short-Range Championship

*Conditions.*—*Teams.*—Each team shall consist of ten men. The teams participating must be composed of members of the various clubs, which they represent. *Rifles.*—Limited to ten pounds in weight; minimum pull of trigger, three pounds; 22-100 cal. Teams can furnish their own rifles and ammunition, or use those at the gallery, as they may desire. *Number of Shots.*—Ten by each competitor. *Sighting Shots.*—Two shots will be allowed each competitor. *Position.*—*Off-hand.*—Targets—200-yards targets, according to the regulations of the N. R. A. reduced in proportion to the range at the gallery. *Practice.*—No practice allowed on the day of the match. *Entrance Fee.*—Five dollars to be paid at the office of the FOREST and STREAM AND ROD AND GUN, No. 111 Fulton street, N. Y. All teams desiring to compete must be entered ten days before the time the match is announced to take place. The match to be governed by the rules of the N. R. A. relating to teams. *Captains* of the competing teams shall meet one week before the commencement of the match, make all preliminary arrangements, choose referees, and decide in what order their respective teams shall shoot. The referees shall elect an umpire, whose decision in all cases shall be final. The time when this match is to be shot will be mentioned in the next number of the paper.

It has all along been tacitly agreed that international matches should be long-range contests. There is reason for this, yet not sufficient ground for the exclusion of other styles of marksmanship in the determination of national champions. It is quite true that the ability to show a good record at the extreme ranges, demands that the marksman be provided with the best arms, that he be in the best condition personally, and that in matters of judgment and discretion he be trained to the highest degree. It affords a style of shooting sufficiently difficult in itself to warrant the highest public honor and praise to the successful marksmen. The popular notion is that such shooting is the most difficult, and therefore the most proper, or so important a test as that on which national championship honors rest, and like many popular notions there is a basis of fact, overlarded with a vast scum of fiction and error.

Every nation has its corps of armed defenders and citizen soldiers. They are generally armed with the best arms so far as their judgment and means dictate, and yet all these armies are various, and it would seem the most natural competition trial possible to have men of these several nationalities come together before the butts, and, armed each with his favorite piece, show their ability and strive for the peaceful trophies of the rifle range. There are difficulties about such a match, many imaginary obstacles and a few real ones. Any fear of losing "points," by exhibiting in this way before a possible enemy, may be set aside as ill-founded. We need no trial to convince us that our Sharps and Remington military weapons are superior to the Snider, or the Manser, or the Ohassepot, and yet a match with men bearing these arms and having faith in them would be serviceable to them and us alike; precisely as our long-range matches have been of advantage, and will be in the future, even though we are now firmly of a mind that our breech-loading match rifles are without a rival in accuracy and precision.

To properly test the question of military rifle superiority would demand the parade of a liberal team, that something of the conditions which surround a man in actual service should prevail. The close coaching system of the long-range match would need be largely laid aside. The men, while mutually helpful, would not be so mutually independent, that the pulsations of one should raise sympathetic throbbings in another. With the rough and ready weapon of the picket line and

An International Military match would call out more enthusiasm, stir up more talk, agitate a much larger circle and do more for the advancement of rifle practice here toward the position of a national sport than a dozen long-range shoots. Nine-tenths of what is now known as modern rifle practice in America may be traced back to the acceptance of the Irish challenge by the Amateur Rifle Club in Nov., 1872. Yet we venture to say that the enthusiasm of that first match and its successors, warm as it was, would be frigid beside the popular outburst which would follow a properly conducted military match open to all the nations (not countries) of the world.

**THE OLYMPIAN TROPHY.**—Col. Robert Olyphant has offered a handsome bronze trophy for competition at Creedmoor during the coming season. Col. Olyphant is desirous of promoting "file and volley firing." The contest, which will be termed the "soldiers' match," will be open to teams of eight (privates or corporals) from any company, troop, or battery, in the National Guard, each organization having the right to enter an unlimited number of teams. The conditions are as follows: Distance, 200 yards; position, standing; weapons, military rifles or carbines, State model. The competitors will be required to wear their uniforms, and the match will be divided into two stages. The first stage will consist of firing by files, five rounds by each man, the time occupied not to exceed two minutes from the command. The second stage will consist of volley firing, five volleys, fired by each team. The firing in both stages will be conducted according to regular tactics, each team being formed into a squad of four files, and commanded by an officer of its own company, who will give the requisite orders. The prize will be held by the team which wins it for one month, when it will again be submitted for competition.

RIFLE-SHOOTING AT CREEDMOOR.—The second contest for a purse of \$100 in gold took place at Creedmoor Gallery, No. 230 Broadway, on Saturday last. The distance covered was 200 yards; ten shots per man. The scores were as follows:

FOURTEENTH REGIMENT ARMORY.—The new armory of the Fourteenth Regiment, Second Division, N. G. S. N. Y., a spacious iron building on Portland avenue, near Auburn place, Brooklyn, was opened with appropriate ceremonies and festivities last Monday evening. An assemblage of military and civil guests crowded the building, among them many gentlemen of prominence. The exercises opened with a review of the regiment by Major-Gen. T. S. Dakin. Following was the presentation of the prizes won by the regiment team at Creedmoor last year, and of a beautifully-designed and ornamented sword and belt, which the officers and men presented to Surgeon Farley in acknowledgment of his success as Captain.

SEVENTH REGIMENT CONCERT.—The first of Grafulla's series of promenade concerts was given in the Seventh Regiment Armory last Saturday evening. The officer's rooms and the main drill room were elegantly decorated with flowers, arms, and bunting; the attendance was large, the toilets brilliant and the programme excellent in selection and execution. During the progress of the concert the rifle club had a shooting match in the basement for the diamond badge, which was won by Private E. W. Price, upon the score of 63 out of a possible 70 points; 28 at 200 and 34 at 500 yards.

Benedicts—Sgt. W. L. Candee, Priv. J. W. Sweeney,  
Priv. J. L. Thompson, Priv. J. K. Barlow, Adj. J. B.

Priv. F. N. Holbrook, Corp. Fred Albers, Lieut. E. W.  
Burd, Sergt. J. M. Allen, Corp. A. G. Weber, Sergt. W. J.  
Oliver.

**THE NEW JERSEY RIFLE ASSOCIATION.**—The Board of Directors of the New Jersey Rifle Association held an adjourned meeting at No. 23 Park row on Thursday last, the 24th of January. Col. W. H. DeHart presided. Mr. Bonnet reported that he had been offered the refusal of a tract extending for 2,500 feet along the line of the Central Railroad of New Jersey, which could be leased for a nominal sum. Mr. Man reported for the Committee on Legislation that he had placed copies of the act of incorporation of the association in the hands of a member of the New Jersey Legislature, who had promised to report the bill at once. On motion of Mr. Man the following committee was appointed to draft articles of incorporation of the association: O. A. S. Man, B. A. Vail, and J. T. B. Collins. Major Fulton stated that it was Governor McClellan's intention to inspire a method for the reorganization of the National Guard of New Jersey, and in the proposition he would make he would refer to the necessity for making provision for rifle practice by the National Guard of that State.

NEW ORLEANS RIFLE CLUB, Jan. 20.—Good scores were made at 500 yards, off-hand, standing, with the following results:

|             |   |   |   |   |   |   |   |   |   |   |   |   |      |
|-------------|---|---|---|---|---|---|---|---|---|---|---|---|------|
| Mr O K..... | 5 | 4 | 7 | 3 | 4 | 5 | 3 | 5 | 4 | 5 | 4 | 4 | 5-65 |
| Dr A B..... | 5 | 4 | 3 | 5 | 6 | 3 | 5 | 2 | 4 | 3 | 5 | 3 | 57   |

The best shots of this club having divided into two teams as evenly as possible, an interesting contest is looked for within the next few weeks. At 100 yards good practice scores were made, and, with the completion of a full team, more than average scores may be expected.

The competition for the new badge presented the club by its president, will take place the first Sunday in February, under special rules of the donator, and his motto, "May the best man win."

FROGMOR—CRESCENT CITY RIFLE CLUB.—The seventh competition for the gold badge of the Louisiana Field Artillery team took place on January 20, on the grounds of the club, Mr. W. R. Verlander being the winner. Below are the leading scores :

|                    |              |                   |              |
|--------------------|--------------|-------------------|--------------|
| W R Verlander..... | 4 4 4 3 4-19 | R F Schmutz.....  | 3 2 3 4 4-16 |

[We beg to call attention to this score, which is remarkable for its excellence. Sixty-six and sixty-four, off-hand, at 200 yards, are very high figures, and difficult to beat. We trust these gentlemen will keep working together as a team. We do not see why we should not have strong teams at short ranges to compete with other teams. If the Cincinnati Shooting and Fishing Club will keep on, they are likely to make a name for themselves.]

BOAT AND YACHT BUILD-  
ING—(11th Paper.)

BY NAUTICS.

ELEMENTS OF YACHTS, MASTING, ETC.

In determining the position of a sloop's mast it is obvious that the farther it is placed forward the larger will be the area of the mainsail. This would be of advantage when sailing before the wind were it not for the following disadvantages, viz.: less spread for the shrouds; increased pitching, owing to the mast being removed far forward of the centre of gravity; and increased weight of boom and mainsail. No rule can be given for the position of the mast, as it depends on the model of the vessel, cut of sails, distribution of weights and position of the centre of gravity, etc. In ordinary examples the mast is placed at one-third of the length of the load water line, measuring from the stem. In mast- ing schooners many of the foregoing remarks are also applicable. The best general rule that I know is Mallet's, as follows: "The mainmast to be placed at one-tenth of the length of the load water line, abaft the centre of vertical longitudinal section immersed, and the foremast at three hundred and forty-five thousandths of the length of the load water line, before the main- mast, these measures to be made at the height of the centre of effort above the load water line, which height may be taken as one-half the hounded length of the masts.

With the masts placed as above the sail draw- ing is made, areas and movements of sails cal- culated, and the centre of effort of the combined sails found, after which—if the centre of effort of the sails is too far forward or aft—the masts and sails may be shifted forward or aft, until the centre of effort is in its proper position relative to the centre of lateral resistance. (See article on sail drawing.) A small amount of "rake" to the masts is desirable, as it not only adds to the appearance, but tends to "tatten" the fore- stay. With excessive rake the mainsail will not draw well going before the wind, especially if the wind is light; the stem of the vessel will also be more depressed. The area of sail, height of the centre of effort, etc., are treated at length in English works. As far as regards English practice, the published tables are val- uable; but for our use they do not appear to be applicable, except it may be the tables for schoo- ners. I have found Mallet's tables for schooners the most satisfactory, and the nearest to Ameri- can practice. Fincham's tables for masting, etc., gives smaller areas and spars. Mallet's unit, or measure, for schooners is found by mul- tipling the area of the load water line by the area of the vertical longitudinal section. This measure seems reasonable, as it takes in consid- eration width and depth; but in his tables for cutters—which correspond to our sloops—he adopts another measure, viz., the area of the load water line multiplied successively by the length of the load water line, the breadth of the load water line, and the decimal seven-tenths, thus practically making the area of the load water line the measure. An empirical rule for sloops may be stated thus: "The hoist of main- sail equal to the greatest beam of the boat mul- tiplied by two; the boom equal to the length of the load water line; the length of gaff boom equal to the beam of boat; the masts placed at one-third of the length of the load water line, measuring from the stern; from mast to end of bowsprit, a distance equal to two-thirds the length of the load water line. Such a rule will give a good proportioned sail, and it probably would not be much too large or small; it would probably require shifting forward or aft, more or less, to bring the centre of effort to its proper position, or the centre of effort may be changed by additions and subtractions of the sail fore and aft the centre. This rule is just as safe to follow, and will give as good satisfaction as many others, but, as before stated, is empirical. In the absence of satisfactory rules, or data to form them, we will state some of the requirements to be observed in determining the area of sail. Experiments have determined the fact that a vessel of sharp model requires an impelling force of forty-eight pounds to the square foot immersed midship section to attain a speed of ten knots per hour. A "light breeze" pres- es with a force of eight-hundredths of a pound on each square foot of sail area; a "fresh breeze," one-half a pound per square foot; a "stiff breeze," two pounds per square foot; a "high wind," from four to five pounds per square foot; and a "very high wind," eight pounds to the square foot of sail area. Taking the immersed area of the midship section as an exponent, I find that yachts are provided with from forty to seventy-five square feet of sail area to every square foot of immersed midship section. If two sails of sail are used—one for cruising and the other for racing—the cruising sail will average from forty to fifty, and the racing sail from sixty to seventy square feet area to every square foot of midship section. It will be man- ifest that the sail area should depend largely on the habits of the owner, prevailing winds, etc. For small sloops I would fix the proportion of sail area at from fifty to seventy times the area of the midship section. The average would be sixty feet. For schooners, from forty to sixty feet, with an average of fifty. The three work- ing sails of the yacht America contained fifty-

one square foot area to every square foot of midship section. The angle to which the sails should be braced when working to windward de- pends on the form of the vessel: narrow, deep vessels bearing a smaller angle than others. The proper angle is best found by experiment, and care taken that the bolt-holes are so placed that the effective angles of the different sails may be alike. The effective angle of the main- sail is some three or four degrees more than the angle formed by the boom. Spars may be of spruce, or pine, or any other wood, in di- ameter; they should have four feet in length to every inch of diameter; if under seven inches diameter, five feet in length to every inch of diameter. The diameter of the mast is greatest at the deck and tapers to the mast-head. At the lower end of the mast-head the diameter of the mast should be three-fourths the deck diameter. The boom should have its greatest diameter at or near its mid-length, and taper each way for- ward the ends. The diameter of the ends of boom may be half, or a little more than half, the diameter of the middle. A cat-rigged yacht re- quires a larger mast than a sloop-rig carrying the same amount of sail—for the reason that no shrouds can be used.

At the present time hollow masts and spars coming into general use—especially hollow masts. George Lawley & Son, yacht builders, of City Point, South Boston, have kindly furnished the following particulars of their practice: "In all cases we use nice, clean spruce, and have the sticks seasoned and dry before putting together. We generally get the sticks out in the fall, scoop them out to the required depth, and put them overhead in the loft to dry. In spring we put them together and finish off. We have no par- ticular rule for fasten- ing of the shell required, always using our judgment, based upon the stability of the boat wanting the spar; but, as a general thing, a spar thirty-two foot long and seven and one-quarter inches diameter needs a shell one and one-quarter inches thick. We commence to scoop them out about one foot from the bottom of mast, and keep the shell the same thickness—one and one-quarter inches—for about ten feet up; then we gradually raise the shell less to the top of the mast. The pieces are put together with dowels, five-sixteenths to eight-sixteenths of an inch diameter, driven in with hot glue. The edges of the pieces are also well glued, so that, when finished, the seam can hardly be seen and is the strongest part of the mast. We never knew of one giving out in the mast. We know of two instances in which masts have been broken, both caused by the shrouds breaking first. Gaffs and main-booms are made on the same principle. Egg-shaped gaffs are doweled on the upper edges and riveted with copper rivets on the lower edge. We make a saving of from one-third to one-half in weight of spars, which is quite an item. Hollow spars add greatly to the speed, and our fastest boats have them with but few exceptions. Cabins on small yachts are a nuisance, and, unless a yacht is to be used for long cruises, had better be omitted. For ordinary use a can- vass can be stretched over the boom, or else hung under it, its edges fastened around the cockpit, and the ends closed by "daps," making a comfortable and dry shelter. If a cabin is that it can be readily removed from the vessel when not wanted. Make the cabin as light as possible, and do not build it too high, or the sta- bility of the vessel will be endangered. The rule to compute the weight of anchor for a ves- sel under one hundred tons is to multiply the square of the extreme breadth by a unit, vary- ing from one and eight-tenths (1.8) to one and two-tenths (1.2), the latter unit for the smaller- sized vessels. Thus, a vessel of ten feet beam would require an anchor of one hundred and twenty pounds.

This rule gives more weight to the anchor than is generally used, but is a safe rule to follow. The diameter of the iron of which the links of the chain is made is as follows: For a fifty-pound anchor, three-sixteenths inch diameter; for a seventy-five pound anchor, chain five-six- teenths of an inch diameter; one hundred and thirty-pound anchor, chain five-six- teenths of an inch diameter; one hundred and sixty to two hundred and fifty-pound an- chors, chain three-eighths of an inch diameter; two hundred and fifty to three hundred and fifty-pound anchors, chain seven-eighths of an inch diameter. The length of chain depends on the cruising ground, from forty to seventy fathoms; for inland waters a dozen fathoms may be suf- ficient. In the next article a model will be given of a cat-rigged yacht in general use, commonly called the "Newport Boat."

NAVAL ARCHITECTURE.—Mr. A. Carey Smith gave the second lecture of the course before the Yacht Club of New York, last Saturday evening. The topic of the evening was the calcu- lations to show the important elements of a ves- sel so as to ascertain what her performance would be by comparison with other vessels similar in size and dimensions. The lecturer sailed as one of the crew of the White Cat for three years, and could not tell why she steered so bad- ly. He procured her model, took the proper draughts from the boat, made a draught and all the calculations, and found that the centre of lateral resistance of the vessel was some dis- tance forward of the centre of lateral resistance of the centre-board, which explained the mystery. All that could be done to obviate the trouble was to put a deep skag upon her aft, and this would be objectionable as lessening the speed. Mr. Smith showed how this defect in shape of model could be avoided, explaining in detail how the area of each section should be calculated, and from these the exact displacement of the vessel ascertained, the calculations being by what is known as "Simpson's rule." While showing the difference of measurement with the plank off or on, he alluded to the models which are hung up in the New York and other club houses, and guarded so jealously, and said that they did not do enough to hang up and look at, but some of them were more like the craft they purported to represent than was the craft. He next explained the method of finding the centre of gravity of displacement or the exact point at which, if weight was applied, the vessel would sink squarely down, not tipping at either end. This was important in view of the placing of the spars. The weight of those forward and abaft

of this point being known, it could easily be seen how much of ballast abaft this point would be required to preserve her balance. He then ex- plained what was meant by the immersed and emerged wedges, meaning those portions of the hull above or below the load-water line that were either elevated or depressed when the ves- sel careened under the pressure of the wind, and he instructed his hearers as to the manner of cal- culating their areas. In conclusion he explained how to find the lateral point of resistance so as to properly place the centre-board. The centre of gravity of which should be immediately under the point of lateral resistance, which meant that point where, if a line were fastened, the vessel would be drawn exactly sideways.

—The yacht Wave has been sold to Mr. Under- hill, of Staten Island.

—Comodoro Noble, of the Columbia Yacht Club; will have a new racing boat from the house of Richard Walton.

—The Pluck and Luck has gone to New Orleans.

—The yacht Tidal Wave goes to parties in San Francisco.

THE INTERNATIONAL REGATTA ASSOCIATION.—A cable dispatch from London to the Boston Globe, dated 21st inst., says: "The International Regatta Association has decided to hold a grand regatta in July, and, in order to induce scullers and rowers from the provinces, United States and all points of the world, will give £2,000 in purses for professionals (scullers and crews) and silver plate for amateur oarsmen. Every inducement is to be made to bring over the oarsmen. Hanlon, of Toronto; Wallace Ross, of St. John, N. B., and Courtney, Scharf and Morris, of the United States, scullers. The amount of all the purses has not yet been decided on, but the purse for the single scull race for the championship of the world, if the Canadian and American champions will compete, will be £200 to the first, £150 to the second and £75 to the third. The other numerous contests will comprise pair and four-oared races, open to all, for the cham- pionship of the world. There will also be a single, pair, four and six-oared race for the amateur championship, open to all universities and regu- lar amateur crews in the world. All the races will be rowed on the Thames, from the aqueduct at Putney to Mortlake. The regatta will last three days and probably four days. Advice re- ceived from the American side state that a scratch amateur four are to visit these shores; also an amateur pair and the Columbia College crew; also Hanlon, the Canadian champion, and the famous Paris crew."

NARRAGANSETT BOAT CLUB.—The Narragan- sett Boat Club, of Providence, have elected the following officers for the ensuing year: Presi- dent, Frederick A. Gower; Vice-President, A. C. Zingley; Captain, Frank A. Sheldon; Lieutenant, W. L. Tourtellot; Secretary, William C. Smith; Treasurer, Frederick W. Greene; Directors: Clinton Hall, L. Newton Peck, F. W. Greene, W. C. Smith, W. L. Tourtellot, F. A. Sheldon, F. A. Gower and A. C. Zingley.

HARVARD FRESHMAN CREW.—The captain of the present Harvard Freshman crew is Mr. W. H. North, of Somerville, and the names of the crew are as follows: A. W. Whiting, New York City; J. S. Bgll, Louisville, Ky.; N. J. Stevens, Lawrence, Kan.; W. Binney, Providence, R. I.; E. D. Blandeg, Utica, N. Y.; W. Brewster, Boston; B. E. Harkins, New York City; P. S. Morse, Boston; W. D. Swan, Cambridge; J. Stewardson, Germantown, Pa.; S. Hammond, Nahant, and H. B. Howard, Worcester. Capt. North is the heaviest man in the crew, his weight being 188 pounds, and E. D. Harkins is the lightest man, his weight being about 155 pounds. The average weight of the men is about 165 pounds, and the height about five feet ten inches.

BOATING AT YALE.—The candidates for the honors of pulling in the coming race have been followed by Capt. Thompson to eleven men as follows: Oliver David Thompson, Butler, Pa.; Herman Livingston, New York City; Frank El- dridge Hyde, Hartford, Conn.; Julian W. Cur- rise, Fairfield, Conn.; Adrian Suydam Polhemus, New York City; John Proctor, Glancie, New York City; Henry Waters Taft, Cincinnati, O.; Wil- liam Reynolds Innis, Poughkeepsie, N. Y.; Frank Alexander Wright, Goshen, N. Y.; John William Keller, Paris, Ky.; George Bliss Rogers, Lexing- ton, Mass. Their age, heights and weights are furnished by Captain Thompson as follows:

| Age.                     | Height. | Weight.      |
|--------------------------|---------|--------------|
| Thompson, 79.....        | 22      | 5 10 1/2 190 |
| Livingston, 79.....      | 23      | 5 11 1/2 190 |
| Hyde, 79.....            | 20      | 5 10 1/2 178 |
| Curris, 79.....          | 19      | 5 10 1/2 170 |
| Polhemus, 79.....        | 21      | 5 11 1/2 170 |
| Clark, 79.....           | 22      | 5 11 1/2 170 |
| Taft, 79.....            | 19      | 6 0 1/2 162  |
| Innis, 79.....           | 19      | 6 0 1/2 173  |
| Wright, 79.....          | 21      | 6 0 1/2 177  |
| Keller, 79.....          | 21      | 6 0 1/2 168  |
| Rogers, 79, S. S. S..... | 20      | 6 0 3/4 193  |

The crew will be selected next month.

BOATING AT WESLEYAN.—After a period of com- parative inaction in boating matters the students at Middletown are now turning their attention to aquatic sports, and it is probable that should the college have an opportunity to participate in a New England regatta she would be represented by an able crew. Among the men who will probably be selected for the crew are: one mem- ber of the crew of '75, D. H. Jack, of the Senior Class, and E. L. Mead, '78; E. A. Sumner, '78 (substitute); E. A. White, '79; B. A. Rich, '78, and J. V. Van Hook, '79, of the crew of 1878. The college is to row a match with the Hartford Rowing Club, and hopes to meet Harvard or Yale at New London.

BOATING AT TRINITY.—The enthusiasm of Trin- ity in boating matters bids fair to triumph over the disasters of the flood which carried away her

boat-house, and the difficulties her delegates have met in their attempts to arrange for New England inter-collegiate matches. The subscrip- tions for the new boat-house amount to \$600, and the new structure will shortly be put up on the Connecticut. There is good material among the students, and the members of the crew would be formed from the following four who have pre- viously rowed together.

|                          | Height. | Weight. |
|--------------------------|---------|---------|
| E. D. Appleton, '80..... | 6 02    | 170     |
| F. P. Wilcox, '80.....   | 6 10    | 150     |
| R. H. Nelson, '80.....   | 6 00    | 172     |
| W. M. Elbert, '79.....   | 6 11    | 180     |

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they pre- pare special designs for similar purposes. Their TIMING WATCHES are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIF- FANY & CO. are also the agents in America for Messrs. PATEK, PHILIPPE & CO., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artis- tic Bronzes and Pottery, Electro- Plate and Sterling Silverware for Household use, fine Station- ery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to pur- chase.

UNION SQUARE, NEW YORK

Medicinal.

APOLLINARIS

NATURAL

Mineral Water.

THE QUEEN OF TABLE WATERS.

HIGHLY EFFERVESCENT.

DR. J. MILNER FOTHERGILL, London.—"The Exquisite Apollinaris is a delicious beverage." PROF. J. A. WANKLYN, St. George's Hospital, London.—"Highly effervescent, wholesome, and absolutely pure; superior to all others." DR. R. OGDEN DOREMUS.—"Absolutely pure and wholesome; superior to all for daily use; free from all the objections urged against Croton and artificially-aerated waters." DR. PETER HOOD, President of the Intern. Medical Society, etc.—"Superior to Vichy and Vals." PETER SQUIRE, F. L. S., Chemist to the Queen.—"Tenth edition of Companion to the British Pharmacopoeia. Exhilarating; good for sickness, dyspepsia, and loss of appetite." MACNAMARA, F. R. C. S., C. S. I., Surgeon to Westminster Hospital, London.—"More whole- some and refreshing than soda or seltzer water." W. ALLINGHAM, F. R. C. S., Surgeon to St. Mark's Hospital, London.—"By far the best sparkling water for daily use."

FREDK DE BARY & CO.,

41 and 43 WARREN ST., N. Y.

Sole Agents for United States and Canada.

For Sale by Dealers, Grocers and Druggists. Every genuine bottle bears the YELLOW label.

Wanted.

WANTED—Heavy single-barrelled breech-load- ing shot-gun, 4 or 5 cal. R. VALENTINE, Janesville, Wis. Jan 31 '21

WANTED—Second-hand breech-loading shot- gun; send description and lowest cash price to J. W. MILLER, P. O. box 150, New Harmony, Indiana. Jan 31 '21

WANTED.—A double breech-loading shot-gun, 12-bore. Address E. P., office FOREST AND STREAM. Jan 31 '21

# NICHOLS & LEFEVER,

SYRACUSE, N. Y.,

MANUFACTURERS OF

## DOUBLE AND SINGLE-BARREL BREECH-LOADING SHOT-GUNS

Double-Barrel Breech-Loading Rifles, and Shot and Rifle combined. Muzzle-Loading Creedmoor guaranteed to be the best, and not to give "UNACCOUNTABLE MISSES."

Our Catalogue for 1878 will be ready January 15, giving full description of gun, recent improvements in same, matters of general interest to Sportsmen, etc., etc.

### EDINA KENNEL.

JESSE SHERWOOD, Proprietor, Edina, Knox  
County, Mo., breeder and importer of Sporting Dogs.  
Pointers, setters, spaniels, fox and beagle hounds.  
"Sancho," Imp. Pointer, stud dog; fee, \$35. See  
English K. C. S. B., No. 1,005. He is a grandson of  
the celebrated "Hamlet," No. 836. This dog  
"Sancho" has won seven prizes—four in England  
first at Crystal Palace, 1874, three here.

## BALLARD'S FLEA KILLER! FOR THE DESTRUCTION OF FLEAS On Dogs and Other Animals.

An Absolute and Perfect Extirminator of the pest.  
May be used with entire safety.  
Contents of a package sufficient to rid half a  
dozen large dogs of the vermin.

NO PERSON OWNING DOGS SHOULD BE WITH-  
OUT THE FLEA KILLER.

Price 50 Cents per Package.

Will be sent postage paid on receipt of price.  
Proprietors,  
LAZELL, MARSH & GARDINER,  
1719 11  
10 GOLD STREET, NEW YORK.

## SPRATT'S PATENT MEAT FIBRINE DOG CAKES.

Twenty-one Gold, Silver and Bronze Medals  
awarded, including Medal of English Kennel  
Club, and of Westminster Kennel  
Club, New York.

None are genuine unless so stamped.  
F. O. De LUZE,  
13 South William Street, N. Y., Sole Agent.  
BROWN & HILDER, St. Louis, Western Agents.  
For sale in cases of 112 pounds.

## Fleas! Fleas! Worms! Worms! STEADMAN'S FLEA POWDER FOR DOGS.

A Bane to Fleas—A Boon to Dogs.  
This Powder is guaranteed to kill fleas on dogs or  
any other animals, or money returned. It is put up  
in patent boxes with sliding pepper box top, which  
greatly facilitates its use. Simple and efficacious.  
Price 50 cents by mail, Postpaid

## ARECA NUT FOR WORMS IN DOGS A CERTAIN REMEDY.

Put up in boxes containing a dozen powders, with  
full directions for use.  
Price 50 cents per Box by mail.  
Both the above are recommended by ROD AND GUN  
and FOREST AND STREAM.

FOR SALE, when eight weeks old, six black and  
tan Gordon setter puppies, four dogs and two  
gyps, whelped Dec. 15, 1877. Sire, imported Prince  
dam, Fannie, she out of Boyden's Hope (imported)  
by Marbles' Grouse. Address, A. H. THOMAS,  
Warrensburg, N. Y. Jan31 1t

WEST MILTON KENNEL—"Lelaps" in the stud,  
bred by R. H. Purcell Llewellyn, England, sire  
"Lelaper," dam "Doll," sister to "Dart" and  
"Adams" "Drake," color white, ticked black and tan,  
23 1/2 inches high, extra quality, very handsome.  
Fee, \$25.

SETTERS FOR SALE—"Fan," black and tan,  
pure Gordon, imp. stock, out of "Maad," by Marbles'  
"Grouse," two years old; taught first lessons; bred  
to "Lelaps" Jan. 5, 1878; price \$75. One dog, two  
years, white and chestnut, sire Tucker's dog, Providence,  
R. I., L. Copeland's "Old Pete" grand sire, dam  
English imported, very handsome, 25 1/2 inches high;  
taught first lesson, and game shot over; price \$75.  
"Bell," half imported red Irish and half English,  
color orange, two years old, taught first and second  
lessons (see circular), extra in field, fast, staunch  
and handsome, 23 1/2 inches high, never bred, price  
\$125; will breed her to "Lelaps," same price. Dogs  
trained and boarded. For terms and particulars,  
send for circular. FRANKLIN SUMNER, Milton,  
Blue Hill, Mass. J17 4t

FOR SALE—A valuable setter dog, nearly three  
years old, choice stock, price \$30. A first-class  
English double barrel breech-loader, made to order  
for A. A. Kellogg, New Haven, Conn; used very  
little; warranted; size, No. 12; price, \$50. Also, a  
Butler Health-Inf; good as new; a little shop worn;  
cost \$75, price \$25. Address 23 Orange street, New  
Haven, Conn. J17 3t

THE DOG BREAKER'S GUIDE.—Train your own  
dogs in the most artistic manner. "The Dog  
Breaker's Guide" sent for three cent stamp, M. VON  
CULIN, Delaware City, Del. J17 1t

FOR SALE.—One imported red Irish setter dog,  
Dash, from J. C. Cooper, Limerick, Ireland, of good  
stock, sired by Grouse out of Phoebe. Dash is  
about two years old and unbroken; of a deep blood  
red color, with slight marking of white on face.  
Price moderate. One Chesapeake Bay duck dog,  
Friday (long hair), well broken to retrieve (about one  
year old). Price, \$25. Snapshot, celebrated cham-  
pion pointer, and Frank, imported English setter,  
winner of first at Philadelphia, in the stud. LIN-  
COLN & HELLAR, Warren, Mass. Jan17 4t

Jan17, 1m

HIGHEST HONORS  
AT THE  
Centennial World's Fair, 1876!  
THE  
**SHONINGER ORGANS**

PRONOUNCED UNANIMOUSLY AS THE  
**Best Instruments.**

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit are the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, easily to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

There are 50,000 of our instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when turned forward, will make a splendid writing desk, with our Book Closets and Swinging Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few new Agents.  
A liberal discount to the Clergy, Sunday Schools, Teachers, Churches and Lodges.  
Illustrated Catalogues, with prices, sent by mail upon application to

**B. SHONINGER ORGAN CO.,**  
97 to 123 Chestnut Street,  
NEW HAVEN, CONN.

**Gunpowder.**

**Warren Powder Mills**

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

**SPORTING BRANDS**—Eureka, Continental "Border Rifle," Snipe Shot, and Warren Sporting Cannon and Musket, U.S. Standard. The above can be had of the dealers, or at wholesale at the office, 21 Doane Street, Boston, Mass., and of the agents, **JOHN P. LOVELL & SONS**, corner of Washington, Cornhill and Brattle Streets, Boston, Mass. 319

THE  
**HAZARD POWDER CO.,**

MANUFACTURERS OF

**GUNPOWDER,**

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 3 1/2 lb. canisters and 6 1/2 and 13 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for musketry or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs, and canisters of 5 lbs. FFG is also packed in 1 and 3 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.**

GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office,  
55 WALL STREET, NEW YORK.

**English Sporting Gunpowder.**

CURTIS & HARVEY'S

**DIAMOND GRAIN.**  
Nos. 2, 3, 4, 5, 6, 7, and 8. Superior Rifle, Field Rifle, and Col. Hawker's Ducking. W. STITT, 51 Cedar Street, N. Y. Agent for the United States.

**Sportsmen's Goods.**

**BOSTON SHOOTING SUIT.**

Manufactured only by

**G. W. SIMMONS & SON,**  
BOSTON, MASS.

**THE BEST IN USE.**

ONLY ONE QUALITY MADE AND THAT IS THE VERY BEST.

Each article—coat, trowsers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$15.

The suit consists of coat, trowsers, vest, and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

**OUR PATENT DECOYS**

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen; geese, \$8 each; yellow leg, \$4.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; golden plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.50 per dozen. We are now making standing geese for field shooting.

**THE HUNTER'S TENT**

is made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

In the judges' report at Philadelphia they were commended for excellence in every part. Very novel and practicable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quick folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

SIR:—I have just returned from a three-weeks' camping expedition in the Adirondacks, and have had the three tents bought of you put to the severest tests of exposure both as to wind and storm, and I do most unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.  
2d. They are perfectly waterproof.  
3d. They are a good height and all the room is available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both indorse what I say about your tent. With kind regards, yours truly,  
F. B. SAVAGE.

**Tan-Colored Leather Pliable Waterproof Suits.**

Shooting Coats, Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches \$15; Jackets, \$18; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM, from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of skin. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with fannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

For every kind of sportsmen's goods address

**G. W. SIMMONS & SON,**  
Oak Hall, Boston, Mass.

PRICE, BOXED, WITH DARTS, SLUGS, TARGETS, &c., \$10.  
FULL NICKEL PLATE \$12.

Just the thing for Taxidermists to collect specimens. There is no report or danger attending its use, or any auxiliaries required to operate it. It can be loaded with ease and rapidly. It is extremely simple, and has no delicate parts to get out of order or wear out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.

SEND FOR CIRCULAR.

H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.

**Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.**

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/4 to 3 3/4 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.  
MESSRS. GEORGE E. HART & CO.—Gentlemen: The fifty Shells I received from you today suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.  
Yours truly,  
A. H. BOGARDUS.

**A VICTORIOUS INVENTION The Eagle Claw.**

An ingenious device for the purpose of catching all kinds of Animals, Fish and Game.

The easy method of setting the Eagle Claw, combined with the simplicity of removing the victim, are among its peculiar advantages.

It is immaterial how to place it when set. It may be buried flat in the ground, suspended from the limb of a tree, or, when occasion requires, covered with grass, leaves or other light material without in any way impairing its certain operation.

It is adapted for bait of any description, and, when set, no Animal, Fish or Bird that touches the bait can possibly escape. It does not mangle or injure its victim in the slightest degree, nor need they be handled to free them from the trap.

**PRICE LIST.**

No. 1—For fishing and all kinds of small game and animals, sent by mail..... 25 cents.  
No. 2—For catching Mink, Muskrats, Raccoons, large Game, Fish, etc..... 75 cents.  
No. 3, or Rocky Mountain Giant, for catching Bears, Wolves, Panthers, etc. Can be easily set by a boy, and will stand a strain of several hundred pounds. Weight, 10 to 15 lbs. \$10.  
All goods sent, charges paid, to any address on receipt of price. Address

## ESTABLISHED IN 1837.

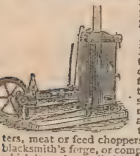

Consult your interest by sending for our revised and reduced prices.

**Excelsior**  
Double Treadle, including one doz. saws, thirty initial Fret Sawing Patterns and pulleys, all for the value of \$4. A new device for tightening Saw, Power Drilling attachment, Wrench, Oil Cup and Screw Driver. Speed, 800 strokes per minute. Saws, 12 inch thick. Full complete, case and delivered on board cars at express office, \$12.  
Saw only, without attachments, \$9.

**BUFFALO PONY PLANNER**  
NEARLY ONE THOUSAND IN USE. Buffalo Pony Planer. Will earn self and, pay expense of running in 8 days. Price from \$50 and upwards, each.

**SMALL STEAM ENGINES.**  
With Copper Boiler, to drive Light Lathes, Scroll Saws, etc. Are all sizes from 1-8 up to 2 horse power; either plain castings, partly finished, or complete, ready for use.  
The "Scientific American" of June 19, 1875, says of the above, in an extended Editorial, introducing our manufactures to the public: "It can turn wingings, chains, washing machines, or ice cream freezers, run coffee mills, pump water through a house, actuate foot lathes, scroll saws or light boring machinery, run knitting or sewing machines, turn a grindstone or empty wheel, work ventilating or hand thrashing machine cutters, meat or feed choppers, or sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a blacksmith's forge, or compress air or work an air pump on a small scale in a laboratory. These are a few only of the purposes to which it can be applied."

**Buffalo Excelsior Pony Planer and Matcher.**  
Patented March 30, 1875.  
Best of its kind in use. Price, complete, \$295. Also planing Machine. Knives, which are recommended as superior and extra in quality.

Also Engines and Boilers capable of propelling 15 to 18 inches. The boats have keel stem, with rudder and tiller, row locks and oars. Those wishing a pleasure boat will find

ling boats from 18 to 28 feet long, 4 1/2 to 5 1/2 feet beam, with draft of water stern and rudder post of oak, pine plank, copper fastened throughout, fitted with all around the boat, lockers and coal bunkers, and have two coats of paint. These the safest and fastest, as they can be made to attain a speed of from 6 to 16 miles per hour. They are adapted to a great variety of uses, such as Excursion, Shooting, Fishing or Pic-Nic Parties, for travelers, druggists, botanists and tourists, and especially owing to their light draft of

water for exploring expeditions and surveying parties. The Engine and Boiler can be easily detached from the boat, and is then available for Agricultural, Mechanical, Commercial or Domestic requirements or for the use of Amateurs, when power is needed for running light machinery.  
Price of 20 foot boat, complete.  
Price of Engine and Boiler, without boat, including driving pulley, \$125.00  
\$275.00

Illustrated Catalogue containing One Hundred Scroll Work Designs mailed to any address free on receipt of Stamp.  
**GEORGE FARR, BUFFALO, N. Y., U. S. A.**

## Three-Barrelled Breech-Loading Guns, TWO SHOT AND ONE RIFLE.

A new feature in the Sporting Line. Forms a light and compact gun from eight to ten pounds, giving to sportsmen the very thing so often wanted in all kinds of shooting.

SEND FOR NEW CIRCULAR.

W. H. BAKER & CO., Syracuse, New York.

## IRA A. PAINE'S FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23.

## THE "STANDARD" BALL.

The Bohemian Glass Works having made a specialty of the manufacture of Glass Balls for Trap Shooting for the past year, and having facilities for manufacturing cheaper and better than other establishments, have secured the services of that well-known Sportsman, IRA A. PAINE, to take entire charge of the production of his new patent Feather Filled Ball, which we hold the exclusive right to make and sell.

While other balls are a drug in the market, over 150,000 of the Paine Feather-Filled Balls have been sold in the last month. This is the only ball made to a scale; every one alike. Out of One Million already sold, not one complaint. No Fancy Price but a fair profit.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 800. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

## Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street.

FOR TRAPS, GEO. E. HART & CO., Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," containing instructions for Glass Ball Shooting, will be ready Feb. 1. Price \$9, by mail, postage paid. Address, Dec 31  
Capt. A. B. BOGARDUS, International Hotel, N. Y.
